Issue 4  
May 1998

## Notice

Every effort was made to ensure that the information in this book was complete and accurate at the time of printing. However, information is subject to change.

## Your Responsibility for Your System's Security

Toll fraud is the unauthorized use of your telecommunications system by an unauthorized party, for example, persons other than your company's employees, agents, subcontractors, or persons working on your company's behalf. Note that there may be a risk of toll fraud associated with your telecommunications system and, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

You and your system manager are responsible for the security of your system, such as programming and configuring your equipment to prevent unauthorized use. The system manager is also responsible for reading all installation, instruction, and system administration documents provided with this product in order to fully understand the features that can introduce risk of toll fraud and the steps that can be taken to reduce that risk. Lucent Technologies does not warrant that this product is immune from or will prevent unauthorized use of common-carrier telecommunication services or facilities accessed through or connected to it. Lucent Technologies will not be responsible for any charges that result from such unauthorized use.

## Lucent Technologies Fraud Intervention

If you *suspect that you are being victimized* by toll fraud and you need technical support or assistance, call Technical Service Center Toll Fraud Intervention Hotline at 1 800 643-2353.

## Federal Communications Commission Statement

**Part 15: Class A Statement.** This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

**Part 68: Network Registration Number.** This equipment is registered with the FCC in accordance with Part 68 of the FCC Rules. It is identified by FCC registration number AS593M-13283-MF-E.

**Part 68: Answer-Supervision Signaling.** Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 Rules. This equipment returns answer-supervision signals to the public switched network when:

- Answered by the called station
- Answered by the attendant
- Routed to a recorded announcement that can be administered by the CPE user

This equipment returns answer-supervision signals on all DID calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered
- A busy tone is received
- A reorder tone is received

## Canadian Department of Communications (DOC)

### Interference Information

This digital apparatus does not exceed the Class A limits for radio noise emissions set out in the radio interference regulations of the Canadian Department of Communications.

Le Présent Appareil Numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la class A prescrites dans le règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

### Trademarks

See the preface of this document.

### Ordering Information

**Call:** Lucent Technologies BCS Publications Center  
Voice 1 800 457-1235 International Voice 317 322-6416  
Fax 1 800 457-1764 International Fax 317 322-6699

**Write:** Lucent Technologies BCS Publications Center  
2855 N. Franklin Road  
Indianapolis, IN 46219

**Order:** Document No. 555-230-522  
Comcode 108215740  
Issue 4, May 1998

For additional documents, refer to Appendix C, "References."

You can be placed on a standing order list for this and other documents you may need. Standing order will enable you to automatically receive updated versions of individual documents or document sets, billed to account information that you provide. For more information on standing orders, or to be put on a list to receive future issues of this document, contact the Lucent Technologies Publications Center.

### European Union Declaration of Conformity

The "CE" mark affixed to the DEFINITY® equipment described in this book indicates that the equipment conforms to the following European Union (EU) Directives:

- Electromagnetic Compatibility (89/336/EEC)
- Low Voltage (73/23/EEC)
- Telecommunications Terminal Equipment (TTE) i-CTR3 BRI and i-CTR4 PRI

For more information on standards compliance, contact your local distributor.

# List of Features

## A

---

- AAR [8-3](#)
- AAR and ARS Overlap Sending [8-20](#)
- AAR and ARS Partitioning [8-21](#)
- Abandoned Call Search [9-3](#)
- Abbreviated Dialing [4-1](#)
- Add/Remove Skills [9-5](#)
- Administered Connections [4-13](#)
- Administrable Language Displays [4-20](#)
- Administration without Hardware [4-40](#)
- Agent Call Handling [9-7](#)
- Alphanumeric Dialing [4-49](#)
- Alternate Facility Restriction Levels [8-29](#)
- Alternate Operations Support System Alarm Number [4-51](#)
- Answer Detection [4-52](#)
- ARS [8-3](#)
- Attendant Auto-Manual Splitting [4-54](#)
- Attendant Backup Alerting [4-55](#)
- Attendant Call Waiting [4-57](#)
- Attendant Calling of Inward Restricted Stations [4-60](#)
- Attendant Console [4-61](#)
- Attendant Control of Trunk Group Access [4-62](#)
- Attendant Crisis Alert [4-66](#)
- Attendant Direct Extension Selection with Busy Lamp Field [4-68](#)
- Attendant Direct Trunk Group Selection [4-72](#)
- Attendant Display [4-74](#)
- Attendant Intrusion [4-83](#)
- Attendant Override of Diversion Features [4-84](#)
- Attendant Priority Queue [4-85](#)
- Attendant Recall [4-88](#)
- Attendant Release Loop Operation [4-89](#)
- Attendant Room Status [10-2](#)
- Attendant Serial Calling [4-90](#)
- Audible Message Waiting [4-92](#)
- Audio Information Exchange (AUDIX) Interface [4-618](#)
- Authorization Codes [4-93](#)
- Auto Start and Don't Split [4-97](#)
- Auto-Available Split [9-22](#)
- Automated Attendant [4-98](#)
- Automatic Call Distribution [9-25](#)

- Automatic Callback [4-100](#)
- Automatic Circuit Assurance [4-104](#)
- Automatic Incoming Call Display [4-108](#)
- Automatic Routing — General [8-2](#)
- Automatic Transmission Measurement System [7-2](#)
- Automatic Wakeup [10-4](#)

## B

---

- Basic Call Management System [9-40](#)
- Block Collect Call [4-110](#)
- Bridged Call Appearance [4-112](#)
- Bulletin Board [4-128](#)
- Busy Verification of Terminals and Trunks [4-130](#)
- Button View [4-135](#)

## C

---

- Call Charge Information [4-136](#)
- Call Coverage [4-146](#)
- Call Detail Recording [4-167](#)
- Call Forwarding [4-224](#)
- Call Management System [9-58](#)
- Call Park [4-232](#)
- Call Pickup [4-236](#)
- Call Prompting [9-60](#)
- Call Vectoring [9-63](#)
- Call Waiting Termination [4-244](#)
- Call-by-Call Service Selection [7-42](#)
- Calling Party/Billing Number [4-246](#)
- CallVisor Adjunct Switch Application Interface [4-250](#)
- Centralized Attendant Service [12-4](#)
- Class of Restriction [4-264](#)
- Class of Service [4-277](#)
- Code Calling Access [4-280](#)
- Conference — Attendant [4-282](#)
- Conference — Terminal [4-284](#)
- Consult [4-286](#)
- Coverage Callback [4-287](#)
- Coverage Incoming Call Identification [4-288](#)
- Customer-Provided-Equipment Alarm [4-289](#)

## D

---

- Data Call Setup [4-290](#)
- Data Hotline [4-298](#)
- Data Only Off Premises Extensions [4-305](#)
- Data Privacy [4-301](#)
- Data Restriction [4-303](#)
- DCS [12-11](#)
- DCS Alphanumeric Display for Terminals [12-27](#)
- DCS Attendant Control of Trunk Group Access [12-28](#)
- DCS Attendant Direct Trunk Group Selection [12-29](#)
- DCS Attendant Display [12-31](#)
- DCS Automatic Callback [12-32](#)
- DCS Automatic Circuit Assurance [12-34](#)
- DCS Busy Verification of Terminals and Trunks [12-35](#)
- DCS Call Coverage [12-36](#)
- DCS Call Forwarding [12-41](#)
- DCS Call Waiting [12-42](#)
- DCS Distinctive Ringing [12-43](#)
- DCS Leave Word Calling [12-44](#)
- DCS Multiappearance Conference/Transfer [12-46](#)
- DCS Over ISDN-PRI D-channel [12-47](#)
- DCS Trunk Group Busy/Warning Indication [12-52](#)
- Default Dialing [4-307](#)
- Demand Print [4-309](#)
- Dial Access to Attendant [4-310](#)
- Dial Plan [4-311](#)
- Digital Multiplexed Interface [7-19](#)
- Distinctive Ringing [4-314](#)
- Distributed Communications System [12-11](#)
- Do Not Disturb [10-11](#)
- DS1 Trunk Service [7-11](#)
- Dual DCP I-Channels [4-317](#)

## E

---

- EIA Interface [6-218](#)
- Emergency Access to the Attendant [4-318](#)
- Enhanced DCS [12-55](#)
- Enhanced ICSU [7-21](#)
- Enhanced Voice Terminal Display [4-322](#)
- Expert Agent Selection [9-72](#)
- Extended Trunk Access [12-67](#)

- Extended User Administration of Redirected Calls [4-333](#)
- Extension Number Portability [12-70](#)
- External Device Alarming [4-340](#)

## F

---

- Facility and Non-Facility Associated Signaling [7-49](#)
- Facility Busy Indication [4-341](#)
- Facility Restriction Levels and Traveling Class Marks [8-24](#)
- Facility Test Calls [4-343](#)
- Flexible Billing [4-345](#)

## G

---

- Generalized Route Selection [8-33](#)
- Go to Cover [4-348](#)
- Group Listen [4-349](#)
- Group Paging [4-352](#)

## H

---

- Hold [4-358](#)
- Hold — Automatic [4-361](#)
- Hospitality Services [10-15](#)
- Hot Line Service [4-363](#)
- Hunt Groups [4-365](#)

## I

---

- Inbound Call Management [9-81](#)
- Individual Attendant Access [4-376](#)
- Integrated Directory [4-379](#)
- Integrated Services Digital Network — Basic Rate Interface [4-382](#)
- Intercept Treatment [4-390](#)
- Intercom — Automatic [4-393](#)
- Intercom — Dial [4-395](#)
- Internal Automatic Answer [4-397](#)
- Inter-PBX Attendant Service (IAS) [12-72](#)
- Intraflow and Interflow [9-95](#)
- ISDN — General [7-25](#)

## L

---

- Last Number Dialed [4-403](#)
- Leave Word Calling [4-405](#)

- Line Lockout [4-409](#)
- Listed Directory Numbers [4-410](#)
- Look-Ahead Interflow [9-98](#)
- Look-Ahead Routing [8-45](#)
- Loudspeaker Paging Access [4-412](#)

## M

---

- Manual Message Waiting [4-429](#)
- Manual Originating Line Service [4-430](#)
- Manual Signaling [4-432](#)
- Messaging Server Interface [4-433](#)
- MF signaling [4-438](#)
- Misoperation Handling [4-445](#)
- Modem Pooling [4-449](#)
- Multiappearance Preselection and Preference [4-452](#)
- Multimedia Call Handling [11-30](#)
- Multiple Call Handling [9-104](#)
- Music-on-Hold Access [4-455](#)

## N

---

- Night Service [4-457](#)
- Node Number Routing [12-74](#)

## O

---

- Off-Premises Station [4-467](#)

## P

---

- PC Console [4-470](#)
- PC Interface [6-220](#)
- PC/PBX Connection [4-471](#)
- Personal Station Access [4-474](#)
- Personalized Ringing [4-480](#)
- Power Failure Transfer [4-482](#)
- Priority Calling [4-483](#)
- Privacy — Attendant Lockout [4-486](#)
- Privacy — Manual Exclusion [4-487](#)
- Private Network Access [12-75](#)
- Property Management System Interface [10-21](#)
- Public Network Call Priority [4-489](#)
- Pull Transfer [4-496](#)

## Q

---

- QSIG [12-77](#)
- QSIG Name and Number Identification [12-86](#)
- QSIG Transit Counter (ANF-TC) [12-99](#)
- Queue Status Indications [9-110](#)

## R

---

- Reason Codes [9-112](#)
- Recall Signaling [4-498](#)
- Recorded Announcement [4-500](#)
- Recorded Telephone Dictation Access [4-508](#)
- Redirection on No Answer [9-116](#)
- Remote Access [4-509](#)
- Restricted/Unrestricted Call Lists [4-515](#)
- Restriction — Controlled [4-518](#)
- Ringback Queuing [4-520](#)
- Ringer Cutoff [4-523](#)
- Ringing — Abbreviated and Delayed [4-526](#)

## S

---

- Security Violation Notification [4-531](#)
- Send All Calls [4-538](#)
- Service Observing [4-539](#)
- Single-Digit Dialing and Mixed Station Numbering [4-553](#)
- Station Hunting [4-557](#)
- Station Security Codes [4-563](#)
- Subnet Trunking [8-48](#)

## T

---

- Temporary Bridged Appearance [4-566](#)
- Tenant Partitioning [4-568](#)
- Terminal Self Administration [4-578](#)
- Terminal Translation Initialization [4-583](#)
- Terminating Extension Group [4-591](#)
- Time of Day Routing [8-50](#)
- Timed Reminder and Attendant Timers [4-594](#)
- Transfer [4-597](#)
- Transfer — Outgoing Trunk to Outgoing Trunk [4-599](#)
- Trunk Flash [4-603](#)
- Trunk Group Administration [7-1](#)

- Trunk Group Busy/Warning Indicators to Attendant [4-607](#)
- Trunk Identification by Attendant [4-609](#)
- Trunk-to-Trunk Transfer [4-611](#)

## U

---

- Uniform Dial Plan [12-103](#)

## V

---

- VDN in a Coverage Path [9-145](#)
- VDN of Origin Announcement [9-146](#)
- Visually Impaired Attendant Service [4-613](#)
- Voice Message Retrieval [4-615](#)
- Voice Response Integration [9-152](#)
- Voice Terminal Alerting Options [4-625](#)
- Voice Terminal Display [4-626](#)
- VuStats [9-161](#)

## W

---

- Wideband Switching [7-56](#)
- World-Class Tone Detection [4-642](#)
- World-Class Tone Generation [4-643](#)

# List of Forms

## Numerics

---

- 7500 Data Module [6-252](#)

## A

---

- AAR and ARS Digit Analysis Table [8-55](#)
- AAR and ARS Digit Conversion Table [8-63](#)

- Time of Day Routing Plan [8-78](#)
- Toll Analysis [5-299](#)
- Trunk Groups — General [7-115](#)

## U

---

- Uniform Dial Plan [12-121](#)
- User Defined Adjunct Names [5-303](#)

## V

---

- Vector Directory Number [9-214](#)
- Vector Routing Table [9-219](#)
- VuStats Display Format [9-221](#)

## W

---

- WATS trunk group [7-268](#)
- World Class BRI Data Module [6-255](#)

## X

---

- X.25 Data Module [6-249](#)

# About This Document

---

## Overview

---

This document describes the DEFINITY Enterprise Communications Server (ECS) Release 6 and includes all incremental releases up to and including Release 6.2. For details about changes in Release 6.1, refer to [Appendix A, "Transition Reference"](#) in this manual. You may also want to refer to the DEFINITY ECS 6.1.0 Change Description.

### NOTE:

This book contains information previously contained in the *DEFINITY ECS Feature Description* and *DEFINITY ECS Implementation* books.

DEFINITY ECS is a family of cost-effective digital communication systems. These systems:

- Route voice and data information between various endpoints (telephones, terminals, computers)
- Provide highly robust networking capabilities
- Include an extensive set of standard features: attendant consoles, voice processing interface, call coverage, DS1 (T1 and E1) connectivity, hospitality support, recorded announcement, and trunk-to-trunk transfer
- Provide flexibility and allow for the addition of optional features and/or upgrades to the system as business needs change

## Purpose

---

This document explains the features that comprise DEFINITY ECS. It provides an introduction to each feature and presents required forms for administration, detailed descriptions, considerations, and interactions between features. This

document provides an overall reference for planning, operating, and administering your DEFINITY ECS. Hardware required for specific features is presented in [Appendix A](#).

This document includes the forms required to implement DEFINITY ECS and descriptions of the fields along with valid values and ranges for each field.

This document is not procedural. It does not contain information about how to install, maintain, repair, or troubleshoot the switch. Refer to [Appendix C](#) for a list of related DEFINITY ECS documents.

## Audience

---

This document is intended for the DEFINITY ECS system administrators and managers, end-users interested in information about specific features, and Lucent Technologies support personnel responsible for planning, designing, configuring, selling, and supporting the system.

## Reason for reissue

---

This document is updated to include DEFINITY ECS Release 6.2 information.

## How to use this document

---

This document is designed to be used as a reference document. If you are interested in information about a particular feature, use the index or table of contents to locate the page number where the feature is described. Forms also can be located this way. They are listed alphabetically in each chapter in the table of contents. The title that appears on the form is the form name.

## Organization

---

This document is organized into chapters by subject. Features are in alphabetical order within each chapter. Pertinent forms follow the features. Basic features and forms are presented in a chapter with the same title. The document includes:

[Chapter 1, “Before You Begin”](#) describes the Communications Survey for gathering system information: its users, their job functions, and their communications needs. It also provides an administration sequence.

[Chapter 2, “System Basics”](#) tells you how to log on, log off, enter commands, set user permissions, print, and use the management terminal. It provides instructions for remote administration and system backup.

**[Chapter 3, “System Security”](#)** describes security practices you should follow and lists the features requiring special measures to secure them from unauthorized use. (You can also consult the index under “Security Measures.”)

**[Chapter 4, “Basic Features”](#)** contains feature-by-feature descriptive and administrative information. These features comprise the core group of DEFINITY ECS features.

**[Chapter 5, “Basic Forms”](#)** contains all of the forms required to administer basic features, descriptions of the fields on each form, and special notes about usage.

**[Chapter 6, “Voice Terminal, PC Interface, and Data Module Administration”](#)** contains all of the voice terminal, PC interface and data module forms and administration in one convenient, easy to use location.

**[Chapter 7, “Trunk Group Administration”](#)** contains all of the trunking features and associated forms necessary to administer trunks. DS1, ISDN, and related features. All trunk group forms are included.

**[Chapter 8, “Automatic Routing”](#)** contains the AAR and ARS features. It includes other features and forms that support automatic routing.

**[Chapter 9, “Call Center”](#)** contains the Call Center features and the forms required to administer these features.

**[Chapter 10, “Hospitality”](#)** contains the Hospitality features and the form required to administer these features.

**[Chapter 11, “Multimedia”](#)** contains the Multimedia features and the forms required to administer these features.

**[Chapter 12, “Private Networking”](#)** contains the Private Networking features and the forms required to administer these features. Included are DCS, QSIG, and Uniform Dial Plan.

**[Appendix A, “Transition Reference”](#)** provides a list indicating new and enhanced features for Release 6.1 and briefly describes Release 6.1 feature enhancements.

**[Appendix B, “Administration Commands”](#)** contains the commands you use to administer DEFINITY ECS features, functions, and services. The use of an abbreviated command structure is discussed as are special command line functions.

**[Appendix C, “References”](#)** provides a list and brief descriptions of reference documents.

“[Glossary and Abbreviations](#)” provides a glossary and list of abbreviations for this and other related DEFINITY ECS documents.

“[Index](#)” provides an index for the entire document.

## Feature-related information

The information for each feature is usually presented under five headings:

- **Feature title**

Gives the name and a brief overview of the feature. Tells what it does or how it serves the system.

- **How to administer**

Provides a list of the forms that are used to administer a feature. Required fields on these forms also are identified.

- **Detailed description**

Provides more detailed, technical information about a feature. When appropriate, additional guidelines and examples are provided. In some cases, expanded technical information is provided on one or several aspects of the feature.

- **Considerations**

Discusses the applications and benefits of a feature and any other factors to be considered when using the feature.

- **Interactions**

Lists and briefly discusses other features that may significantly affect a feature. Interacting features are those that:

- Depend on each other — if one of the features is provided, the other also must be provided.
- Cannot coexist — if one of the features is provided, the other cannot be provided.
- Affect each other — the normal operation of one feature modifies, or is modified by, the normal operation of the other feature.
- Enhance each other — the features, in combination, provide improved service to the user.

## Conventions used in this document

This document uses the following conventions:

 **NOTE:**

Draws attention to information that you must heed.

 **CAUTION:**

*Denotes possible harm to software, possible loss of data, or possible service interruptions.*

 **WARNING:**

*Denotes possible harm to hardware or equipment.*

 **SECURITY ALERT:**

*Indicates when system administration may leave your system open to toll fraud.*

## **How to get help**

For those times when you need additional help, the following help services are available. You may need to purchase an extended service agreement to use some of these help services. See your Lucent Technologies representative for more information.

- Lucent Technologies Centers of Excellence
  - Asia/Pacific  
65-872-8686
  - Western Europe/Middle East/South Africa  
441-252-391-889
  - Central/Eastern Europe  
361-270-5160
  - Central/Latin America/Caribbean  
1-303-538-4666
  - North America  
1-800-248-1111
- DEFINITY Helpline  
1-800-225-7585
- Lucent Technologies Toll Fraud Intervention  
1-800-643-2353
- Lucent Technologies National Customer Care Center Support Line  
1-800-242-2121
- Lucent Technologies Corporate Security

# Before You Begin

# 1

---

## Overview

This chapter contains guidelines to help you get ready to administer your system. Before you do this, you should attend the customer training system administration course. You should have thorough training on the following items before attempting to administer the system:

- System and voice terminal features
- Hardware requirements
- Port assignments
- Management terminal operation

---

## Communications survey

Before you begin to administer your DEFINITY ECS, complete the following communications survey. This task consists of gathering information about the system, its users, their job functions, and their communications needs. After you identify this information, you can match it to the available features and hardware to design a system that fulfills your requirements.

Basically, the survey:

- Identifies the appropriate features and calling privileges for each user
- Assigns appropriate data on hard-copy forms that subsequently become part of the system's software database

Before you begin the survey, do a quick review of the information provided in the rest of this book. "[About This Document](#)" provides an overview of the contents of the remaining chapters, and is a good place to start.

Complete each of the survey steps in the order given. Depending on the offer definition, some steps are best performed as a cooperative effort between you and your Lucent Technologies account team.

Become familiar with the features, the forms required, and the data to be entered on the forms. Some of the steps in this survey ask you to gather information using duplicates of forms from the system. These forms are available in either *DEFINITY Enterprise Communications Server Implementation Blank Forms* or *DEFINITY Enterprise Communications Server Administration and Feature Description*. You can use these forms as a guide when you actually administer the system.

The following documents provide additional information:

- *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference*
- *DEFINITY Communications System Generic 3 Planning and Configuration*
- *DEFINITY Enterprise Communications Server Release 6 — Installation and Test for Single-Carrier Cabinets* or *Installation and Test for Multi-Carrier Cabinets*

## **Step 1 — Equipment and feature list**

---

- Obtain a list of equipment (including number and type) that has been ordered for the system. Identify the system cabinets ordered.
- Find out what features and services are to be provided.

## **Step 2 — Port assignment records and Circuit Pack forms**

---

See *DEFINITY Communications System Generic 3 Planning and Configuration* for information about how to complete port assignment records for the system. For information about how to complete the Circuit Pack forms, see [Chapter 5, “Basic Forms”](#). You will need this data to complete the feature and network forms covered in this manual.

## **Step 3 — Trunk groups**

---

You can have a variety of trunk types connected to your system. One or more trunks of a particular type make up a trunk group. A complete list of all trunk groups supported by the system appears below. For each trunk type you will use, review the associated trunk group description in this book. Identify the associated trunk group forms required and the fields on the forms to be completed. Complete the appropriate fields on all forms as required.

- Access
- Advanced Private Line Termination (APLT)

- CAMA - E911
- Centralized Automatic Message Accounting (CAMA/E911)
- Central Office (CO)
- Customer-Provided Equipment (CPE)
- Digital Multiplexed Interface Bit-Oriented Signaling (DMI-BOS)
- Direct Inward Dialing (DID)
- Direct Inward Outward Dialing (DIOD)
- Foreign Exchange (FX)
- Integrated Services Digital Network (ISDN)
- Personal Central Office Line (PCOL)
- Release Link Trunk (RLT)
- Tandem
- Tie
- Wide Area Telecommunications Service (WATS)

#### **Step 4 — Optional feature software**

Many features are optional and may or may not be purchased with your system. To enable optional features, a representative of Lucent Technologies must complete the System-Parameters Customer-Options form. You can view this form to determine which optional features are active on your system. Once you know this, you can assemble the information necessary to administer these features.

For each optional feature you need to administer, review the feature description in this book. Identify the associated system forms and the fields on the forms to be completed, and determine the number of forms required. Complete the appropriate fields on the duplicated forms as required.

#### **NOTE:**

You cannot access forms or fields on forms associated with an optional feature that is not activated.

#### **Step 5 — Remaining system features and services**

For each feature you need to administer, review the feature description in this book. Identify the associated system forms and the fields on the forms to be completed, and determine the number of forms required. Complete the fields on the duplicated forms as required.

As you proceed, there will be times when the data for a field on a form has not yet been identified. For those cases, note the fields requiring completion and then proceed. Later, complete the form when the applicable data is identified.

## Step 6 — End-user survey

---

Establish contact with a representative from each department, section, or work group that will be using the system. Each person selected must have the authority to make some decisions about the new communications system. You will need to interview these contacts as you go about the process of completing the system forms.

Identify each system user name, terminal type, and extension number to be assigned.

If required, enter each user name, terminal type, and extension number on a floor plan, or equivalent drawing. The floor plan will help you visualize various work groups and make later group assignments such as call-answering groups or call-pickup groups easier. This drawing, or an equivalent, can then be used by the installation technicians when installing voice terminals and associated equipment.

For all terminal types and quantities of each type identified, remove the applicable blank station forms from *DEFINITY ECS Implementation Blank Forms* and duplicate as many times as necessary.

On each duplicated station form, enter the applicable terminal type, user name, extension number, and port number.

## Step 7 — Group forms

---

For each of the following features to be provided, review the associated description in this book, identify the associated forms and the fields on the forms to be completed, and determine the number of forms required. Remove the applicable blank station forms from *DEFINITY ECS Implementation Blank Forms* or *DEFINITY ECS Administration and Feature Description* and duplicate as many times as necessary.

- Abbreviated Dialing List — System List
- Abbreviated Dialing List — Group List
- Abbreviated Dialing List — Personal List
- Abbreviated Dialing List — Enhanced List
- Call Coverage
- Hunt Groups
- Intercom Groups — Automatic and Dial
- Malicious Call Trace
- Pickup Group
- Terminating Extension Group

## **Step 8 — Voice terminals**

---

Complete the various fields on the previously obtained station forms. Before actually assigning features on the forms, review the features that can be assigned to each terminal type, the recommended button names, and the abbreviated feature name that must be entered on the form. You also need to consider the maximum number of buttons that can be assigned to a feature or function.

Voice terminal figures in this book show each terminal that can be assigned, their associated button positions, and a suggested standard button arrangement. The maximum number of buttons that can be assigned features (administrable buttons) is shown for each terminal type. You must not exceed this number when assigning feature buttons to the terminal.

A set of preprinted labels comes with each voice terminal. After you make button assignments, be sure to insert the labels next to the appropriate button.

## **Step 9 — Review**

---

Review all the features and services that you will use and ensure that you have completed forms for all features and services to be provided.

Retain all completed forms for use during system initialization.

## **Administration sequence**

---

After the system is installed and you have completed the communications survey, you must enter the data into system memory. [Chapter 2, "System Basics"](#), provides information about how to login and how to use the system administration terminal (SAT).

Obtain all duplicated forms from the survey and sort them into groups. For example, separate the forms for all voice terminals, hunt groups and trunk groups. Have a copy of the port-assignment record available to keep track of the items as you install them.

## **Record keeping**

---

Record keeping plays a vital role in system administration. Records provide a current status of what hardware and which features have been installed.

The port assignment record provides a record of how a system is initialized and administered. Ports are the physical location on a circuit pack where terminals, trunks, or system adjuncts are connected. Once port numbers are assigned, they become the address of the associated equipment or facility in the system. It

is necessary that a record be made and kept of port assignments for system installation/initialization and ongoing administration.

Use a work request form or worksheet to keep track of who has requested features and the features they desired. Follow your company policy concerning keeping records.

## Entering translations

Translations tell the system how you want things to be in your particular system. For example, a user's name, extension, terminal type, class of restriction, and port number are all translations that are specific to your system. Everything you do to make the system meet your needs is a translation.

When entering this information into the system, you should periodically save the translations. This creates a nonvolatile copy of the translations you have already entered into the system. Then if a power outage or system failure occurs, you will not need to retype each translation.

You should enter the system translations in an ordered manner. The following is the recommended order:

1. Login and password (change password, if necessary)
2. Dial Plan
3. Feature Access Codes
4. System Features (Class of Service and Class of Restriction)
5. Console Parameters
6. Attendant Consoles
7. System Parameters
8. Voice Terminals
9. Data Modules
10. Netcon Channels
11. Groups (hunt groups, pickup groups, etc.)
12. Trunk Groups
13. Automatic Route Selection
14. Administered Connections

## **Login and password**

Once you have all the forms together, you can log in to the system. For security reasons, it is a good idea to change your password at this time. For login process, see ["Login to the SAT" on page 2-3.](#)

## Establish a Dial Plan

You must administer the Dial Plan and Feature Access Codes (FACs) before you can administer voice terminals, hunt groups, pickup groups, coverage groups, and attendant consoles. You can change the default values for the Dial Plan if they do not meet business requirements.

## Feature Access Codes

The FAC form contains default values, which you may change to meet your business requirements. The number of digits assigned to the FAC must agree with the Dial Plan.

## System Features

System features include the Class of Service (COS) and Class of Restriction (COR). You cannot add these features, but you can change them.

## Console Parameters and Attendant Consoles

Attendant consoles must be added one at a time. A vacant port on a digital line circuit pack is required for each attendant console used. For reliability, attendant consoles should not be assigned to the same circuit pack.

## System Parameters

System parameters allow you to assign values for system-related features such as Leave Word Calling (LWC), Hospitality Features, and Call Detail Recording (CDR).

## Voice Terminals

Once you have established the Dial Plan and FACs, you can add voice terminals. The **duplicate** command can be used to add the same types of voice terminals. The extension number, location, type, and user name should be entered on the form.

## Data Modules

You can assign data modules after voice terminal administration, or at the same time, if the voice terminal has a data module.

## Netcon Channels/SAPs

Netcon channels provide switched data access for the following:

- Call Detail Recording (CDR)
- On-premises administration/maintenance terminal
- Remote administration/maintenance terminal

- Property Management System (PMS) Link
- PMS Log Printer
- Journal Printer
- Recorded Announcements
- System Printer

Netcon channels are assigned by entering the command **add data-module (extension number or next)** and then entering **Netcon** in the `Type` field. Up to four Netcon channels can be assigned. The channels can be added by entering the command **duplicate data-module xxx (extension number to be duplicated)**.

## Groups

After you have administered the voice terminals, you can administer the following items using the **add** commands:

- Abbreviated Dialing (System, Group, Enhanced)
- Hunt Groups
- Call Coverage Answer Groups
- Pickup Groups
- Intercom Groups
- Terminating Extension Groups

## Trunk groups

Your account team should help you determine what information you need to complete the trunk group forms. See [“Trunk Group Administration” on page 7-1](#) and [“Private Networking” on page 12-1](#) for more information.

## System Basics

# 2

---

### Overview

---

This chapter provides basic information you need to manage your DEFINITY Enterprise Communications Server (ECS). This includes how to log in and log off, how to add and remove logins, how to set permissions for others who use the administration terminal, and how to back up the information you administer.

If you use the DEFINITY Communications System Generic 3 Management Applications (G3-MA) to administer your system, see *DEFINITY Communications System Generic 3 Management Applications Operations*, for system management procedures.

### The system administrator's role

---

As system administrator, you are responsible for the following:

- Adding, changing, removing, and monitoring the system and voice terminal features on a day-to-day basis
- Performing system backup procedures
- Monitoring system performance
- Maintaining system security

## **The system administration terminal**

Your DEFINITY ECS comes equipped with a system administration terminal (SAT) that consists of a monitor and a keyboard. You use the SAT to configure your system, to change system settings, and to monitor system performance. Maintenance personnel may also use the SAT to perform testing and maintenance operations.

The system can be equipped with one of several different terminal types, including the following:

- 715 Multi-Task (MT) terminal
- 513 BCT
- 610 BCT
- 615 MT terminal
- 4410 terminal
- 4425 terminal
- Personal Computer (PC) using a 513, 4410, or 4425 emulation software package
- DEC VT220

### **Terminal emulation**

Some terminals can emulate other terminal types. You need to use terminal emulation if you use a PC. See the documentation that came with the terminal to determine how you should set it up.

### **Programmable keys**

Some keyboards are equipped with programmable function keys, often called user PF keys. You can program a key to automatically type a command on the command line, such as add station next, or duplicate station. You may then need to type additional qualifiers, such as an extension. See your terminal documentation to see if you can do this.

## **How to log in and log off**

Before you can perform any system administration commands or functions, you must successfully log in to the system. When you are not using the system, you should log off for security purposes.

## Login to the SAT

---

1. Turn on the monitor, if required. The `Login:` prompt appears.
2. Enter your login name and press RETURN.

Some keyboards have two keys labeled ENTER and none labeled RETURN. These keys do not have the same function. Where this document says to press RETURN, press the ENTER key next to the alphabet keys. Where this document says to press ENTER, press the ENTER key on the number pad.

The `Password:` prompt appears.

3. Enter your password and press RETURN.

For security reasons, your password does not display as you type it. The system verifies a valid login and password name were entered. If you entered an invalid login or password name, the system responds with `INCORRECT LOGIN` and the `Login:` prompt reappears for you to try again.

4. If the system recognizes the login and password name,

```
Terminal Type (Enter 513, 715, 4410, 4425, or VT220):  
[ 513 ]
```

displays on the screen.

5. If your terminal is a 513 or emulates a 513 terminal, simply press RETURN to accept the default. If your terminal is anything other than a 513, type in the terminal type or the type your system emulates, then press RETURN.

### NOTE:

If you accidentally enter the wrong terminal type, it can lock up your system. Type **newterm (correct terminal type)** and press ENTER. If this does not work, turn the power off **ON THE TERMINAL ONLY**. The terminal reboots and you can login again.

6. The `Command:` prompt appears.

## Logoff of the SAT

---

You should logoff the system any time you are not using the SAT. To log off the system, at the `Command:` prompt, type **logoff** and press RETURN. The system automatically disconnects you from the system.

## Logoff notification

If you attempt to logoff while a facility test call or remote access is active, and logoff notification is enabled for your login, the logoff notification screen appears. You need to respond to the `Proceed with Logoff` prompt on the logoff screen. The response defaults to `n`; type `y` to override the default.

```
Facility Test Call Administered
Remote Access Administered

Proceed with Logoff? [n]
```

### Screen 2-1. Logoff Notification Screen

#### SECURITY ALERT:

*To logoff with the Facility Test Calls feature access code administered poses a significant security risk.*

*To logoff with Remote Access administered poses a significant security risk if you are using the feature in conjunction with Facility Test Calls.*

A notification screen also appears if you attempt to logoff while alarm origination is disabled. If you do this and the system generates an alarm, Lucent support services will not receive any notification of the alarm. See *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6r* or *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6vs/si* or *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6csi*.

## Using the SAT

---

The DEFINITY ECS administration terminal is easy to use. When in doubt, press HELP.

## Help

---

At any point on the command line, or when your cursor is in a field on a form, you can press the Help key to see a list of available commands or entries. If the level requires a particular keyword (that is, the level is an Action or Object level), a list of the valid keywords at that level is displayed. If the level is the Qualifier level, a message is displayed describing the format and the type of parameter required at that level. Brackets ([ ]) around keywords or qualifiers indicate that the keyword, qualifier, or the part of the qualifier enclosed in the brackets is optional.

The system only displays those commands and objects that you have permission to use and that are relevant to your system configuration.

## Display screen format

---

For the command line interface, the display screen is made up of 27 lines of 80 characters each. The screen is partitioned as follows:

|              |   |
|--------------|---|
| Line 1       | Line 1 is the command path line and displays the command you entered to view the current form, the active switch processing element in duplicated systems, and the page number. |
| Lines 2–22   | These lines display command output and multiline help messages.   |
| Line 23      | This line is the message line and displays single-line help and error messages.   |
| Line 24      | This line is the command line, where commands appear as you type.   |
| Lines 26, 27 | These lines display the functions of screen-labeled programmable keys. Normally, these lines are blank.   |

## SAT function keys

---

Some special keys perform certain functions within the system. These keys may be labeled with a name (CANCEL, HELP) or they may be labeled F1, F2, etc. If your keys are not labeled, you should have a legend at the bottom of the screen to tell you what key to use for each function.

- **Cancel** — Pressing CANCEL on the command line cancels the command, and clears the command line. When the cursor is in a form, CANCEL returns the cursor to the command line, and the system ignores any changes you made to the form.
- **Character Erase** — The BACKSPACE key erases the character to the left of the cursor and moves the cursor to that position. If the cursor is at the first position, BACKSPACE causes the terminal bell to ring.
- **Help** — Pressing the HELP function key displays a list of valid keywords for the current level or a message describing the format and the type of parameter expected at this level.
- **Word Delete** — The BACKTAB (shift-tab) key erases the last word typed on the command line. If there are no words on the command line, word delete backs up one level along the hierarchical command structure.

- **Command Line Terminator** — Pressing RETURN or TAB from the command line enters the current command into the system. If the cursor is in a form, these keys move the cursor to the next field.  
  
Some keyboards have two keys labeled ENTER and none labeled RETURN. These keys do not have the same function. Where this document says to press RETURN, press the ENTER key next to the alphabet keys. Where this document says to press ENTER, press the ENTER key on the number pad.
- **Print** — Typing **print** as part of a display or list command allows you to print all or part of the translation data of the specified object at a slave printer. If the “print” option is entered as part of other commands, the system returns an error message and a prompt for a correct command.
- **Direct Page Access** — When a multipage form is being displayed, the user may skip directly to any page by pressing the OPTS key (this is labeled GO TO PAGE on a 715) and entering the desired page number, rather than by using the “Page” key to advance to the desired page.
- **Repeat Last Command** — Typing **R** at the command prompt causes the previously executed command line to be re-displayed with the cursor positioned at the end of the line. You can execute the command “as-is” by simply pressing the RETURN key, or edit the command using the Word Delete functions described above.
- **Cursor keys** — The cursor keys allow you to move the cursor between fields and pages on a screen form. The cursor must be positioned in a field before you can change information in that field.

## Commands

---

Commands are grouped into the following four categories:

- **Administration** — Used to administer data associated with terminals, facilities, and system parameters. [Appendix C](#) contains a list of Administration commands and their associated objects. Note that not all commands are available to all logins.
- **Maintenance** — Used to perform maintenance and testing on trunks, terminals, ports, and system control modules. Also used to obtain displays of error and alarm logs. See *DEFINITY Enterprise Communications Server Maintenance* manuals for information associated with maintenance commands.
- **Measurements** — Used to obtain displays of measurement reports for trunk groups, hunt groups, attendants, etc. See *DEFINITY Enterprise Communications Server System Monitoring and Reporting* for information associated with measurement commands.
- **System** — Used to change passwords and administer the command authorization structure. This chapter discusses these commands.

You must be logged onto DEFINITY ECS before you can enter commands. The DEFINITY ECS is case-sensitive. Always enter commands in lowercase, unless a name, login-ID or password contains uppercase characters.

## Command structure

A command consists of *Action*, *Object*, and sometimes *Qualifier* words that instruct the system to do a specific task.

The Action is the first word you enter on the command line and specifies the operation to be performed (such as, add, change, or delete). The Object is the second word you enter and specifies the object to be operated on, for example, a station, trunk group, or hunt group. Finally, the qualifier can be one or more key words or digits that further identify or complete the object. The qualifier may be mandatory or optional, depending on the command or system configuration.

You can enter only one command at a time. For example, the command required to add a station with extension number 1212 is shown below:

*add station 1212*

In the above example, *add* is the Action word, *station* is the Object word, and *1212* is the Qualifier word.

You must separate each Action, Object, and Qualifier word with spaces.

## Command abbreviation and keyword entry

In most cases, you do not need to type every character of a command. You can type a shortened form of the command, as long as what you type is unique to the command.

For example, for the command line **change station 3600**, you could type **ch st 3600**. If the character string you enter is not unique, an error message appears. For example, if you type **dis** for the command display, the system replies with `'dis' is an ambiguous entry` and a list of all the possible commands that start with dis. At this point, you only need to add the p to the abbreviation to form *disp*, an entry that is not ambiguous.

## Login administration

When your DEFINITY ECS is delivered, one customer super-user login and password combination is already defined. You must administer additional logins and passwords if needed. If you are the super-user, you have full customer permissions and can customize any login you create. The maximum number of customer logins is 11.

As super-user, you can establish permissions for the other logins in your system. You can block access to any object that may compromise switch security.

**⇒ NOTE:**

You cannot use a shortened form of the login ID for any of the following actions.

The following login administration commands are available.

| Action  | Object      | Qualifier                             |
|---------|-------------|---------------------------------------|
| add     | login       | xxxxxx (login-ID)                     |
| change  | login       | xxxxxx (login-ID)                     |
| change  | permissions | xxxxxx (login-ID)                     |
| display | login       | xxxxxx (login-ID) [print or schedule] |
| display | permissions | xxxxxx (login-ID) [print or schedule] |
| list    | logins      |                                       |
| remove  | login       | xxxxxx (login-ID)                     |

### To add a login

To add a customer login you must be a super-user with authority to administer permissions. To establish a login, first use the Login Administration form. Once the login is established, set permissions using the Command Permission Categories form.

If you are adding a login, enter the new login name as part of the add command. The name must be 3–6 characters, and can contain the characters 0-9, a-z, A-Z.

If you add or remove a login, the “Security Measurement” reports are not updated until the next hourly poll, or you type the **clear measurements security-violations** command.

```

                LOGIN ADMINISTRATION

Password of Login Making Change:

LOGIN BEING ADMINISTERED
                Login's Name:xxxxxxx
                Login Type:
                Service Level:
Disable Following a Security Violation?
                Access to INADS Port?

LOGIN'S PASSWORD INFORMATION
                Login's Password:
                Reenter Login's Password:
Password Aging Cycle Length (Days):

LOGOFF NOTIFICATION
Facility Test Call Notification? y      Acknowledgment Required? y
Remote Access Notification? y          Acknowledgment Required? y
```

## Screen 2-2. Login Administration form

This form contains the following fields.

- **Password of Login Making Change** — You must enter your password in order to change any field on this form.
- **Login's Name** — Displays the login name you assigned when you entered the add login command.
- **Login Type** — Indicates whether this login belongs to a customer or to Lucent services personnel. The default and only valid value for customer logins is customer.
- **Service Level** — Indicates whether this user has super-user or non-super-user permissions. Default is non-super-user. You cannot change your own service level.
  - The super-user login has access to the **add, change, display, list,** and **remove** commands for all customer logins and passwords. The super-user can administer any mix of super-user and non-super-user logins, up to a total of eleven customer logins.
  - “Non-super-user” permissions are limited by restrictions specified by the super-user when administering the non-super-user login. A non-super-user can change his/her password with permission set by the super-user, however once a password has been changed the non-super-user must wait 24 hours before changing the password again. A non-super-user cannot change other user passwords, login characteristics, or permissions.

- **Disable Following a Security Violation** — Enter **y** (default) to disable this login following a login security violation. This field only appears when the SVN Login Violation Notification feature is enabled.
- **Access to INADS Port** — Enter **y** to allow access to the remote administration port. This field only appears if Lucent Technologies has enabled customer access to the INADS Remote Administration Port. Default is **n**.
- **Login's Password** — You must assign the initial password for this login. The owner of the login should change the password immediately. Passwords must be 4–11 characters in length and contain at least 1 alphabetic and 1 numeric character. Valid characters include numbers, and !&\*?;'^ ( ),.- The password does not display on the screen as you type.
- **Re-enter Login's Password** — The login's password as above, for verification. The password does not display on the screen as you type.
- **Password Aging Cycle Length** — For security purposes, you should assign password aging to all logins. Enter the number of days that the password will remain valid. The system tracks a password from the day the login was created or the day the user last changed the password. If you enter a blank in this field, password aging does not apply to the login. Default is blank.
- **Facility Test Call Notification** — If this field is **y**, the user receives notification at logoff that the facility test call feature access code is administered. Default is **y**. For security purposes, this field should be **y** for all logins.
- **(Facility Test Call Notification) Acknowledgment Required** — If this field is **y**, the user is required to acknowledge that he or she wishes to logoff while Facility Test Call is still administered. Default is **y**.
- **Remote Access Notification** — If this field is **y**, the user receives notification at logoff that remote access is still administered. Default is **y**. For security purposes, this field should be **y** for all logins.
- **(Remote Access Notification) Acknowledgment Required** — If this field is **y**, the user is required to acknowledge that he or she wishes to logoff while remote access is still administered. Default is **y**.

## To change a login's attributes

To change a customer login's attributes you must be a super-user, and have administration permissions.

1. Enter the command **change login (login-ID)** to access the Login Administration form. Make any necessary changes and press ENTER to record the changes in the system.

## To display a login

To display a specific login:

1. Enter the command **display login (login-ID)** and press the Enter key.

The system displays the Login Administration form with all information about the requested login except the password.

## To list logins

To list all of the system logins and the status of each login, enter the command **list logins**.

The system displays the following information for all current logins:

- Name
- Service level
- Status (active, inactive, disabled, svn-disabled, void)
- Password aging cycle length

The system displays only those logins with the same, or lower, service level as the user making the request.

## To remove a login

To remove a login from the system, you must use a super-user login:

1. Enter the command **remove login (login-ID)**.

The system displays the Login Administration form with all information about the requested login except the password.

2. Press ENTER to remove the login, or press CANCEL to cancel the procedure without removing the login.

## Forced password aging

Password aging is an option that you can activate while administering logins. The password for each login can be aged starting with the date the password was created, or changed, and continuing for a specified number of days (1 to 99).

The user is notified at the login prompt, 7 days before the password expiration date, that the password is about to expire. When the password expires, the user must enter a new password into the system before logging in. Once a non-super-user has changed his or her password, the user must wait 24 hours to change the password again.

```
      Login: telmgr

      Password:
      Your Password has expired, enter a new one.

      Reenter Current Password:

              New Password:

      Reenter New Password:
```

### Screen 2-3. Change Password screen

#### Command permission categories

Once you have created a login, you can modify the permissions associated with the login. The system maintains default permissions for each level of login, but you may want to further restrict the login, or at least make sure the defaults are appropriate for the user. The default values for these fields vary based on the login type.

When set to **y**, the permissions on this form apply for any object that is not restricted. The second and third pages of the Command Permission Categories form allow you to restrict the user from any access to specified objects. To access this form, use the command **change permissions (login-ID)**.

```

                                                                    Page 1 of 3
                                COMMAND PERMISSION CATEGORIES
                                Login Name: Sup3ru

COMMON COMMANDS
    Display Admin. and Maint. Data? y
    System Measurements? y

ADMINISTRATION COMMANDS
    Administer Stations? y           Administer Features? y
    Administer Trunks? y           Administer Permissions? y
    Additional Restrictions? n

MAINTENANCE COMMANDS
    Maintain Stations? n           Maintain Switch Circuit Packs? n
    Maintain Trunks? n           Maintain Process Circuit Packs? n
    Maintain Systems? n           Maintain Enhanced DSL? n
```

### Screen 2-4. Command Permission Categories (Page 1 of 3)

- **Login Name** — This field displays the login to which these permissions apply.
- **Display Admin. and Maint. Data** — Users with this permission can use display, list, monitor, status and schedule (reports) commands. They can also change their own passwords, and schedule reports.
- **System Measurements** — Users with this permission can use the list measurements commands. This field only appears for vs/si systems.
- **Administer Stations** — Users with this permission can add, change, duplicate or remove stations, data modules and associated feature, such as abbreviated dialing, vectors and routing tables.
- **Administer Features** — Users with this permission can administer feature-related parameters, such as coverage paths, class of service, class of restriction, system parameters, authorization codes and security. Use caution when assigning this permission to a user.
- **Administer Trunks** — Users with this permission can administer AAR/ARS, trunk groups, remote access and route patterns. This permission should only belong to users who are very familiar with these features.
- **Administer Permissions** — Users with this permission can administer logins and command permissions. This permission only applies to super-user logins.
- **Additional Restrictions** — If this field is **y**, the second and third pages of this form appear. You can use these pages to add up to 40 objects that this user cannot manipulate. If an object appears on the Additional Restrictions page, users cannot display, add, change, or do anything with that object.
- **Maintain Stations** — You can only enter **y** in this field if `Station` and `Trunk MSP` is **y** on the System-Parameters Customer-Options form. Allows users to perform station maintenance.
- **Maintain Switch Circuit Packs** — You can only enter **y** in this field if `Station` and `Trunk MSP` is **y** on the System-Parameters Customer-Options form. Allows users to perform circuit pack maintenance.
- **Maintain Trunks** — You can only enter **y** in this field if `Station` and `Trunk MSP` is **y** on the System-Parameters Customer-Options form. Allows users to perform trunk maintenance.
- **Maintain Process Circuit Packs** — You can only enter **y** in this field if `Processor` and `System MSP` is **y** on the System-Parameters Customer-Options form. Allows users to perform processor maintenance.

- **Maintain Systems** — You can only enter **y** in this field if `Processor` and `System MSP` is **y** on the System-Parameters Customer-Options form. Allows users to perform system maintenance.
- **Maintain Enhanced DS1** — You can only enter **y** in this field if `DS1 MSP` is **y** on the System-Parameters Customer-Options form. Allows users to perform enhanced DS1 maintenance.

Page 2 of 3

COMMAND PERMISSION CATEGORIES  
RESTRICTED OBJECT LIST

|       |       |

Screen 2-5. Command Permissions Categories (Page 2)

Pages 2 and 3 of this form are identical, and allow you to specify certain objects that this user cannot access. If you want to limit a user's permissions beyond those on page one, enter the objects in this list. For example, if you want a user to be able to add and change stations, but not VDNs, you can enter **y** in the `Administer Stations` field and the `Additional Restrictions` field. Then on this page, enter `vdn` as a restricted object.

## Remote administration

Remote administration allows the system to be administered from a remote terminal. A local administration terminal is one that is located on-premises within 50 (15.25m) feet of the system cabinet. A terminal located more than 50 feet (15.25m) from the system cabinet is considered remote. A remote administration terminal can be on-premises or off-premises. The remote terminal can perform the same functions as the local terminal.

You can connect several terminals to the system at the same time. These terminals can display information simultaneously, but the system limits the type of simultaneous changes that users can make from any two (or more) terminals. These limitations, and the number of terminals you can connect to a system, are documented in *DEFINITY ECS Release 6 System Description Pocket Reference*.

 **SECURITY ALERT:**

*When logging into the system from a remote location using the asynchronous link, you should not be on the link too long or leave the terminal unattended while logged in. This link is used by the system to transmit alarms and errors to a central maintenance site. A long login session may block reporting of important maintenance information.*

See the *BCS Products Security Handbook* for suggestions on preventing unauthorized access to system ports.

To allow remote administration, you need to establish a remote administration link, and you may need to assign the remote administration extension to a hunt group. The members of this hunt group are the extensions of the data modules available to connect to the SAT. For information about how to do this, find the data module type you are using elsewhere in this book.

To set up the system to allow Remote Administration, do the following:

1. For Release 5vs/si and later configurations, translate all four netcon channels. For Release 5r and later configurations, administer the system access ports.
2. Translate a Uniform Call Distribution (UCD) hunt group using a hunt group form.
  - a. In the `Group Extension` field, enter an extension number. If you use Direct Inward Dialing (DID) for remote administration, enter a DID extension number.

 **SECURITY ALERT:**

*Using DID for remote administration presents a major security risk.*

- b. In the `Group Members Assignment` field, enter the four extension numbers previously assigned to the four netcon channels or system access ports.

If the system will be remotely administered from an on-premises terminal, no additional translations are required. You do not need to administer DID if the remote terminal is on-premises or accessible through DCS.

If the system will be remotely administered from an off-premises location via a dial-up facility, complete Steps 3 and 4.

3. Translate a pooled modem if not translated previously. See [“Modem Pooling” on page 4-449](#) for more information.
      4. Translate a trunk group if not translated previously.

## How to perform remote administration

1. Using either the keyboard or voice terminal, dial the UCD group extension number. This number will be one of the following (see [Table 2-1](#)):
  - a. From off-premises:
    - The DID number, or
    - An LDN (you must use a voice terminal), or
    - The trunk number dedicated to remote administration
  - b. From on-premises:
    - An extension number
2. If a DID number, dedicated trunk number, or extension was dialed, receive data tone or visually receive answer confirmation.

If an LDN was dialed, the attendant will answer. Ask to be transferred to the UCD group extension number. Receive data tone or visually receive answer confirmation. Transfer the voice call to your data terminal.
3. The `Login:` prompt appears.
4. Enter your login and password.
5. Perform system administration.
6. Log off and disconnect.

## Data terminal speed settings

Ensure data terminal speed settings are compatible with the modem pool and the netcon/data channel. Use the table below to determine the data terminal speed setting that you need.

**Table 2-1. Data Terminal Speed Settings**

| Data Terminal                              | Speed        |
|--|--------------|
| Integrated pooled modem circuit pack TN758 | 1200 BPS     |
| Combined modem pools                       |              |
| NETCON data channel                        | Up to 9.6PBS |
| System access ports                        | 9.6 KBS      |

## How to set the system date and time

You use the Date and Time form to set the system date and time. You should always update the date and time for events such as a leap year, daylight savings time, or a system restart after a power failure.

If a time of day is not administered, CDR records are not generated. The correct time and date assure that CDR records are correct for the records being kept. CDR does not work until the time and date have been entered. To set the system time and date:

Enter the command **set time** and press RETURN. The Date and Time form appears.

```
set time                                page 1 of 1
                                     DATE AND TIME
DATE
    Day of the Week: _____      Month: _____
    Day of the Month:  __           Year:  ____
TIME
    Hour:  __                       Second: XX
    Minute: __
```

### Screen 2-6. Date and Time screen

This form contains the following fields:

- **Day of the Week** — Valid values are Sunday–Saturday.
- **Month** — Valid values are January–December.
- **Day of the Month** — Valid values are 1–31.
- **Year** — Valid values are 1990–2099.
- **Hour** — Valid values are 0–23 using the 24-hour clock. For example, if the current time is 2:00 p.m., enter **14**.
- **Second** — Displays the seconds. You cannot update this field. It resets to 0 when you press ENTER.
- **Minute** — Valid values are 0–59.

Verify the date and time by entering the command **display time**.

## How to print on demand

---

When you use the list and display commands, you can either view the information on screen, or redirect the output to a printer. To get a printout of the data, add the word **print** or the abbreviation **pr** to the end of the command. This command prints to the printer connected to the SAT, rather than to the system printer.

For example, the command **display abbreviated-dialing group 20 print** provides a printout of AD group number 20. See *DEFINITY ECS System Monitoring and Reporting* for more information about the system printer and report scheduler.

## System backup for R6vs/si and later configurations

---

### Save and restore Recorded Announcements

---

#### TN750C announcement circuit pack

The TN750C circuit pack contains flash memory which provides internal backup of announcements on the circuit packs. Thus, the TN750C circuit pack does not need the save and restore processes still available for the TN750 and TN750B circuit packs. However, you can use the save and restore processes to copy announcements between TN750B/C circuit packs.

The command syntax for saving from a TN750C circuit pack is:

**save announcements ['from' cabinet(1-X). carrier (A-E), slot (0-20)]**

where X for cabinet is the system maximum and where "slot" is the number of the slot occupied by the circuit pack you want to back up or restore.

The command syntax for restoring to a TN750C circuit pack is:

**Restore announcements [disk | tape ['to' cabinet(1-X). carrier (A-E), slot (0-20)]]**

where X for cabinet is the system maximum and where "slot" is the number of the slot occupied by the circuit pack you want to back up or restore.

If there are multiple circuit packs in your system, you must specify the slot location of the circuit pack. If there is only one circuit pack, the system defaults to the proper location.

When you execute a restore command, you receive a warning message:

**WARNING:**

*WARNING: This restore announcement command will overwrite the specified circuit packs existing announcements.*

## Save translation

To backup the DEFINITY Release 5si/vs and later configurations, you use a memory card. In case of a power failure, the system translations and announcements can be restored using the memory card.

Translation data can be automatically saved every 24 hours, if administered on the System-Parameters Maintenance form. However, if your translation data changes frequently, you should also save translations frequently to assure that you have the most up-to-date information.

**NOTE:**

You should not save translations if memory card alarm conditions occur or if the system is having problems (such as processor, memory, or netcon alarms).

**NOTE:**

Save translations after business hours to prevent dial tone delays. Or, if your business operates 24 hours, save translations during slow business hours.

Use the following procedure to save translations to the memory card:

1. Verify that the memory card is in the Netcon circuit pack.
2. Log in to the administration terminal.
3. Verify that the screen displays the prompt `Command :`
4. Enter **save translation** and press RETURN. This command instructs the system to take all translation information in memory and transfer it into the memory card.

2 System Basics

System backup for R6vs/si and later configurations

Page 2-20

```
save translation                               SPE A
                                           SAVE TRANSLATION

Processor                                     Command Completion Status      Error Code
SPE_A                                         Success                          0

Command successfully completely enter command:
```

Screen 2-7. Save Translation screen — SPEA

5. Verify that the `Success` message appears in the `Command Completion Status` field. If it does not, an error message appears instead.
6. If the system is equipped with an Announcement circuit pack, you can save the recorded announcements using the **save announcements** command. Enter **save announcements** and press RETURN.

```
save announcements
                                           SAVE ANNOUNCEMENTS

Processor                                     Command Completion Status      Error Code
SPE_A                                         Success                          0

Command successfully completely enter command:
```

Screen 2-8. Save Announcements screen — SPEA

7. Verify that the `Success` message appears in the `Command Completion Status` field. If it does not, an error message appears instead.

One memory card is provided with the system. If you also have a backup memory card, replace the existing card with the backup card, and perform the save translation operation. You can also save announcements to the backup memory card. The procedure is the same.

Remove the backup memory card and replace the original card when finished. Label the memory card as a backup, and include the date and time. Store the backup memory card in a secure place.

## Errors

---

Memory card-related failures may occur for two reasons: the card is at fault or the Netcon circuit pack is at fault. When these failures occur, the system responds with error messages. The following is a list of the error messages in alphabetical order and recommended responses to each. Check for proper operation after each response is completed. You should also check the hardware error log for errors, and then use the maintenance manual or complete repair procedures.

1. Cannot access file storage area

The wrong memory card may be installed.

*Response:* Check to see which memory card is installed. If the correct one is installed, test it. If it passes, and the problem still persists, escalate the problem to the next level of support.

2. Cannot access file; wrong type of Memory Card is inserted

You have not inserted the correct memory card for the operation you wish to perform.

*Response:* Load the appropriate memory card.

3. Cannot access mass storage system now; try again later

Indicates the storage system is in use.

*Response:* Try again later.

4. Cannot turn on 12 volt power supply

Indicates something may be wrong with the (TN777B) Netcon circuit pack (where the power supply is).

*Response:* Test the 12-volt power supply by running the **test card-mem** command from the system administration terminal. Executing the command causes the system to run Test 701 (12 Volt Power Supply Test). If the power supply test fails, replace the (TN777B) Netcon circuit pack. To do this, follow the instructions in the Maintenance manual for MO 12v-PWR. Then, repeat whichever command failed.

5. Command has been aborted; please try later

The command has been preempted.

*Response:* Try again later.

6. Could not write to Memory Card

Indicates something may be wrong with the memory card.

*Response:* Test the memory card (run **test card-mem**).

7. File size exceeded

You have run out of file space.

*Response:* Call your Lucent Technologies representative.

2 System Basics

System backup for R6vs/si and later configurations

Page 2-22

8. Invalid directory on memory card

Indicates the memory card needs refreshing, or that something is wrong with the memory card.

*Response:* Run **test card-mem** and be sure all tests pass. Replace the memory card.

9. Memory Card is not inserted in the system

You have not inserted the memory card.

*Response:* Insert the memory card.

10. Memory Card is write-protected

Indicates the switch on the top side of the memory card is incorrectly set.

*Response:* Move the switch to the correct position with the point of a pencil or similar object. See the following figure:

---

**Figure 2-1. Memory Card Write-Protect Switch**

11. Memory Card is unusable

Indicates something is wrong with the memory card.

*Response:* Replace the Memory Card.

12. Request is incompatible with currently running operations

Indicates the storage system is in use.

*Response:* Try again later.

2 System Basics

System backup for R6vs/si and later configurations

Page 2-23

13. Saved copy of announcements is unusable

The file on the memory card is unusable.

*Response:* Use another backup card if you have one. Instances such as this illustrate the importance of having backup cards.

14. Saved copy of translations is unusable

The copy of the translations on your memory card is faulty.

*Response:* Run the **save translations** command again.

15. Success: translation file nearly full – get larger card

This message appears in response to a “save translation” command. The translation was saved successfully but this is just a warning that the card is 95 percent full.

*Response:* Order a larger card.

16. Transmission problem; please try later

There is a problem communicating with the announcement circuit pack.

*Response:* Check to see that a data module, “Type: announcement” has been administered correctly. Use the list data-module command to determine if the data-module “Type: announcement” is administered. The data module “Type: announcement” is administered using the add data-module <extension\_number of data module type announcement>. If adding or checking the data module type announcement, verify that the “Board:” field is translated with network, carrier and slot where the announcement circuit pack is installed. Check that the Class of Restriction (COR) of the data module “Type announcement” is allowed to terminate calls from the data-modules “Type: netcon.” The data modules “Type Netcon:” with their COR can be identified by using the “list data-module” command. Note that netcon data modules must also have their COR’s translated so that they can call each other.

17. Unknown type of Memory Card

The software does not know what type of memory card is inserted in the slot. This can occur if the card is unformatted or if the current vintage of the software does not recognize that type of memory card.

*Response:* Replace the memory card with a formatted memory card the software can recognize.

18. Upgrade Memory Card inserted

You may have inserted the System Upgrade memory card instead of the 4 Mb memory card.

*Response:* Insert the 4 Mb memory card.

## System backup for R6r and later configurations

---

The primary backup operations are:

- **Save translation:** All translation data is kept in memory during system operation. This means that all data would be lost if the switch went down. The save translation operation allows the system administrator to save the in-memory translation data on disk/tape. This operation may be done as part of scheduled maintenance and/or as required.
- **Backup/Restore:** In a disk/tape configuration, additional data integrity is achievable through the disk-to-tape backup process. The backup operation can be done as part of scheduled maintenance and/or as required. The contents of the disk are copied onto a tape. This tape backup contains enough formatting/structure to allow the system to boot from it.

The **save announcement** command is only allowed if there is an integrated announcement circuit pack in the system (E28).

When MSS devices on both processors in a duplicated system are specified, the save announcements operation saves announcement data from the announcement circuit pack to the active and standby MSS devices in parallel. The status of each save operation is reported to the user separately. If one of the save operations fail, the save operation to the other device continues. The goal is to save the new announcement data on some MSS device so that it is not totally lost; this causes the announcement data to be inconsistent between these MSS devices.

In case of a failure, it is the user's responsibility to make the announcement files on the two MSS devices consistent. The files may become inconsistent due to hardware failures or if "save" to one device fails while the other continues; for example, while using the **either** option.

### Restore Announcements Command

---

The **restore announcements** command copies announcement data from the specified MSS device to the announcement circuit pack.

### Command Syntax

**restore announcements [disk | tape]**

The announcement file is always restored from the active device.

The **[disk | tape]** options specify the device from which to restore the announcement circuit pack data. This set of options only applies in a system with a disk.

## 2 System Basics

*System backup for R6r and later configurations*

Page 2-25

Invoking the **restore announcements** command with the **disk** option forces the system to copy the announcement circuit pack data from the disk to the announcement circuit pack.

Invoking the **restore announcements** command with the **tape** option forces the system to copy the announcement circuit pack data from the tape to the announcement circuit pack.

### Command Operation

There is only one announcement circuit pack allowed in the system. The announcement file is always restored from the active processor's device.

The **restore announcements** command is not allowed if there is no integrated announcement circuit pack in the system (E28); or if any port on the ANN circuit pack is active (E31).

In the case where the system crashes and/or there is a processor interchange, the restore operation fails. In this case, there is not a valid announcement file on the announcement circuit pack. The command should be restarted on the newly active processor to copy the announcements from the active processor's MSS device to the announcement circuit pack. Until the announcements are successfully and completely copied to the announcement circuit pack, calls are not connected to any announcements on the ANN circuit pack.

When the ANN circuit pack is plugged in or reset, maintenance performs a series of tests, including a DRAM Checksum test. The test fails due to the power loss to the circuit pack, resulting in automatic downloading of the announcement file.

### Error Conditions

The following is a list of all error messages displayed to the user. If any of these error conditions can be attributed to hardware failures or disk/tape configuration problems, they are logged with the maintenance subsystem. Error messages that are caused by a user entering improper command operations are not logged with the maintenance subsystem; the user is notified of the error.

For each error message listed, an identifier is provided that indicates where on the screen the message occurs. If (M) is shown next to the error code, the error message appears on the message line. If (W) is shown next to the error code, the error message appears as command output.

A failure can occur on either processor in a duplicated system. When the error is displayed, it is associated with the processor on which the error was encountered.

**2 System Basics**

*System backup for R6r and later configurations*

|         |  |
|---------|--|
| E3 (M)  | <p>MSS is currently in use</p> <p>Some other administration or maintenance user is currently making use of the MSS device and, therefore, it is not available for the MSS operation requested.</p>   |

| E42 (W) | MSS device is maintenance busy   |

## Save Translation command

The **save translation** command copies translation data from memory to the MSS. By default, translation data is written to the primary MSS device in a simplex processor system, or to both primary MSS devices in a duplicated processor system. In addition, the **save translation** command can be directed to write to devices on either of the processors and/or the secondary device(s). The translation data can be automatically backed up as part of regularly scheduled maintenance. It is recommended that automatic backup be performed on a daily basis.

### Command syntax

The bracketed options specify to which mass storage system the translation data is to be saved. This set of options only applies in a duplicated system. The options, **SPE\_A** and **SPE\_B**, see processors **A** and **B** respectively in a duplicated system.

Invoking the command with the **active** option instructs the system to write to the specified device in the active processor.

Invoking the command with the **standby** option instructs the system to write to the specified device in the standby processor.

Invoking the command with the **either** option causes the system to write the translation data to the specified device on both processors. If the standby processor is inaccessible, the command still executes on the active processor and data is copied to the specified device.

Invoking the **save translation** command with the **SPE\_A** option forces the system to write the translation data to the specified device in processor A. **SPE\_A** is the default in a simplex system.

Invoking the **save translation** command with the **SPE\_B** option forces the system to write the translation data to the specified device in processor B.

In duplicated systems, **both** is the default option.

The **[disk | tape]** option specifies the device on which to save the translation data. This option set only applies in a system with a disk.

Invoking the **save translation** command with the **disk** option forces the system to write the translation data to the disk. In a system configured with both a disk and a tape, **disk** is the default.

Invoking the **save translation** command with the **tape** option forces the system to write the translation data to the tape. In a system configured with only a tape unit, **tape** is the default.

In a duplex system, the capability to save translation to only one of the MSS devices is provided. This capability should be exercised with extreme caution since it is likely to lead to translation data inconsistencies between the different devices on the two processors.

## Command operation

The **save translation** command writes two time-stamped identical copies of translation data to the selected devices. The time stamp for both copies are the same (the time of writing to the first copy). Each copy also contains the state of the copy (either “good” or “bad”).

The save operation writes one complete copy first, then writes the second copy in a different area of the device. The save operation updates only one copy at a time. The save operation always overwrites the “least good” copy first. The following selection criteria should be applied on both the active and standby devices:

- If a copy has a bad status, always overwrite that copy first.
- If both copies have good status, overwrite the one with the older time stamp. If both time stamps are the same, it does not matter which copy is overwritten first since the copies are identical.

Each copy of the translation data is marked “bad” prior to a translation save operation, and it is only marked “good” after the save operation to that file completes successfully. Any failure during the save operation, including a system crash, usually affects only one copy of translation data. If this occurs, the affected copy is marked with a “bad” status indicator and should not be used to load translation into the system. Thus an intact copy of translation can be used as a backup. Normally at least one of the two copies is in a good state. If **save translation** is performed automatically as part of daily scheduled maintenance, there is a high degree of probability that identical copies of translation exist on the tape.

When MSS devices on both processors in a duplicated system are specified, the save operation saves translation data from the active processor to the active and standby MSS devices in parallel. The status of each save operation is reported to the user separately. If one of the save operations fail, the save operation to the other device continues.

If invoked during regularly scheduled maintenance, the **save translation** command in a duplicated processor system saves the translation to one of the MSS devices even if the other device is out of service.

The command completion status is displayed on [Screen 2-9](#).

2 System Basics

System backup for R6r and later configurations

```

Save Translation
Processor      Command Completion Status      Error Code
SPE_A*        success/specific error message  n1
SPE_B*        success/specific error message  n2
    
```

Screen 2-9. Command Completion Status

- In a simplex system, only the active (default) SPE status is given. In a duplex system, if a qualifier is used to select save translation for only one SPE, only that SPE's status is given.

The displayed information includes either a success message or an error message and error code for each processor (see [Table 2-2](#)). A success message means both copies of translation data were updated successfully on a particular device from the in-memory translation data. The error code for each processor provides further information as to whether only one or two copies of translation data were updated successfully. If only one copy was updated or neither copy was updated, an alarm would be raised on that device so that the system technician can take appropriate repair actions.

Table 2-2. Save Translation Command Error Codes

| CODE | Interpretation  |
|------|---|
| 0    | The save operation was a complete success; both copies of translation data were updated.              |
| 1    | The save operation was a partial success; only one of the two copies of translation data was updated. |
| 2    | The save operation failed completely; no translation was saved to either copy of translation data.    |

The following operational rules apply to the **save translation** command:

1. The **save translation** command is only allowed if there are no translation updates being made. All requests to update translation after the command starts are denied (E1).  
 If Terminal Translation Initialization (TTI) activation or deactivation is in progress, the **save translation** command is denied (E2).
2. The **save translation** command is not allowed if the MSS is engaged by another user or is being used for background maintenance (E3).

## 2 System Basics

System backup for R6r and later configurations

Page 2-31

3. The options entered by the user are validated against the system configuration and the target devices for the **save translation** command are determined (E11, E12).
4. If the user requests that translation be saved to a disk, the disk must be in service (E13). If the user requests that translation be saved to a tape, the tape must be in service (E14). If the user requests that translation be saved to the standby processor, the standby processor must be in service, shadowing must be enabled, refresh must be completed, and handshake must be up (E16).
5. If the file system of the target device is a core-dump file system, the command is denied (E17).

If the target device is a tape, and the file system type of the tape is an installation file system, and the vintage of the boot image running in the active processor matches the vintage of the boot image on the tape, then the system first configures the tape with the same configuration as is currently running. If the in-memory vintage does not match the vintage on the tape, the save translation command is denied (E18). In this situation, the user must manually configure the tape by using the **configure** command and then reissue the **save translation** command.

6. If errors are encountered in the operations described above, the save operation should not be attempted.

## Backup command

Additional data integrity is achievable through disk to tape backups. These backups may be done on demand or run daily as part of scheduled maintenance. The **backup** command works in either a simplex SPE or a duplex SPE system. When the command is run as part of scheduled maintenance, the default for a simplex system is an **incremental** backup of SPE A. In a duplex system, the default is an **incremental** backup on **both** SPE A and SPE B.

When the **backup** command is executed on demand the defaults remain the same.

## Command syntax

**backup disk [active | standby | SPE\_A | SPE\_B | both | either] [incremental | full]**

The bracketed options, **[active | standby | SPE\_A | SPE\_B | both | either]**, specify which mass storage system the user wishes to backup. Invoking the **backup** command with the **SPE\_A** option causes files from the disk associated with processor **A** to be copied to the tape cartridge on the same processor. **SPE\_A** is the default in a simplex system. Invoking the **backup** command with the **SPE\_B** option causes the files on the disk on processor **B** to be copied to the tape on the same processor.

## 2 System Basics

*System backup for R6r and later configurations*

Page 2-32

Invoking the command with the **active** option causes the files on the disk on the active processor to be copied to the tape on that processor.

Invoking the command with the **standby** option causes the files on the disk on the standby processor to be copied to the tape on that processor.

Invoking the **backup** command with the **both** option causes files on the disks associated with both of the processors to be backed up to their respective tapes concurrently. If the standby processor is inaccessible the command fails on both processors. No files are copied from disk to tape on either processor. The default value in a duplex system is **both**.

Invoking the **backup disk** command with the **either** option causes the files on the disks associated with both of the processors to be backed up to their respective tapes concurrently. If the standby processor is inaccessible, the command still executes on the active processor and the disk files is copied to tape.

Invoking the command with the **incremental** option causes a selective backup to be performed. In this case, all files on the disk that are marked as “good files” and which have a newer last file update time than the corresponding tape files, are copied to the tape. Not copying files marked as “bad” ensures that corrupted files do not overwrite good (but possibly older) files. The default value is **incremental**.

If a **full** disk backup is specified, the entire disk is copied to tape. All files, “good” and “bad,” regardless of the last file update times, are copied to the tape.

### Command operation

When an **incremental** backup is performed, the following procedure governs this operation. Before each file is copied from the disk to the tape, the file on the tape is marked as “bad.” When the file has been completely copied over to the tape, the file is then marked as “good” on the tape. This process ensures that if the system were to reboot in the middle of this operation, files in the process of being copied are not usable (on the tape) because they are still marked as “bad.”

When a **full** backup is performed, the following procedures are used. When the process begins, all files on the tape are marked as “bad.” When the entire disk has been copied, the files on the tape are marked as “good.” The only exception to this is that a file which is marked as “bad” on the disk retains this marking on the tape also.

When the backup is performed on **both** processors, the operation is performed in parallel. If the backup operation fails on one processor the backup operation proceeds on the other processor.

The success or failure of the backup operation for each processor is displayed on the screen, as shown on [Screen 2-10](#).

```
Processor      Backup Disk
              Command Completion Status
SPE_A*        success/specific error message
SPE_B*        success/specific error message
```

## Screen 2-10. Backup Completion Station

\* In a simplex system, only the active (default) SPE status is given. In a duplex system, if a qualifier is used to select backup disk for only one SPE, only that SPE's status is given.

The following operational rules apply to the **backup** command:

1. The **backup** command is only allowed if there are no other applications currently using the MSS devices (E3).
2. The options entered by the user are validated against the system configuration and the target devices for the backup command are determined (E11).
3. The disk must be in service (E13). The tape must be in service (E14).
4. If the user requests that the **backup** take place on the standby processor, the standby processor must be in service, shadowing enabled, and refresh completed (E16). If the file system of the tape is a core-dump file system, the command is denied (E17).

For incremental backup, if the file system type of the tape is an installation file system, and the vintage of the boot image running in the active processor matches the vintage of the boot image on the tape, then the system first configures the tape with the same configuration as is currently running. If the in-memory vintage does not match the vintage on the tape, the **backup** command is denied (E18). The tape must be manually configured in this situation.

If the **incremental** option is specified and the file systems of the disk and tape are not the same, the command is denied (E23).

5. For full backup, if the tape has installation, large, or core-dump file system, backup proceeds.
6. If errors are encountered in the operations described above, the backup operation should not be attempted.

## Restore command

---

The **restore** command allows the user to copy files from a tape (which was used to backup the disk) to the disk. This operation is used for system installation, system upgrades/updates, or after a repair of the disk has occurred.

### Command syntax

**restore disk [active | standby | SPE\_A | SPE\_B | both | either] [incremental | full]**

The options, **[active | standby | SPE\_A | SPE\_B | either | both]**, specify which mass storage system the user wishes to restore.

Invoking the **restore** command with the **SPE\_A** option causes files from the tape associated with processor **A** to be copied to the disk on that same processor. **SPE\_A** is the default in a simplex system.

Invoking the **restore** command with the **SPE\_B** option causes files from the tape associated with processor **B** to be copied to the disk on that same processor.

Invoking the **restore** command with the **active** option causes the files on the tape on the active processor to be copied to the disk on the same processor.

Invoking the **restore** command with the **standby** option causes files from the tape associated with the standby processor to be copied to the disk on that same processor.

Invoking the **restore** command with the **both** option forces the system to copy files from the tape-to-disk device on both mass storage systems concurrently. If the standby processor is inaccessible, the command fails on both processors. This means that no data is written on either of the specified processors. The default in a duplex system is **both**.

Invoking the **restore** command with the **either** option forces the system to copy files from tape to disk device in both mass storage systems concurrently. If the standby processor is inaccessible, the command still executes on the active processor and files are copied to the disk.

Invoking the command with the **incremental** option causes a selective restore operation to be performed. In this case, all files on the tape that are marked as "good" and which have a newer last file update time than the corresponding disk files, are copied to the disk. Not copying files marked as "bad" ensures that corrupted files do not overwrite good (but possibly older) files. The default value is **full**.

If a **full** disk restore is specified, the entire contents of the tape are copied to the disk. All files, "good" and "bad," regardless of the last file update times, are copied to the disk.

## Command operation

For an **incremental** restore, the files are copied in the following manner. Before each file is copied from the tape to the disk, the file on the disk is marked as “bad.” When the file from the tape has been completely copied over onto the disk, the file is then marked as “good” on the disk. This process ensures that if the system were to reboot in the middle of the operation, files in the process of being copied are not usable because they are still marked as “bad.”

For a **full** restore operation, the files are copied in the following manner. When the process begins, all files on the disk are marked as “bad.” When the entire tape has been copied to disk, the files on the disk are marked as “good.” The only exception to this is that a file which is marked as “bad” on the tape retains this marking on the disk also.

The success or failure of the command for each processor is displayed on the screen, as shown in [Screen 2-11](#).

```
Processor      Restore Disk
              Command Completion Status
SPE_A*        success/specific error message
SPE_B*        success/specific error message
```

### Screen 2-11. Restore Completion Status

The following operational rules apply to the **restore** command:

1. The **restore** command is only allowed to run if there are no other applications currently using the MSS devices (E3).
2. The options entered by the user are validated against the system configuration, and the target devices for the restore command are determined (E11).
3. The disk must be in service (E13). The tape must be in service (E14).
4. If the user requests that the restore take place on the standby processor, the standby processor must be in service, shadowing enabled, and refresh completed (E16).
5. If the file system of the tape is a core-dump file system, the command is denied (E17).

If the file system of the tape is an installation file system, the command is denied (E22). If the **incremental** option is specified and the file systems of the disk and tape are not the same, the command is denied (E23).

6. If errors are encountered in the operations described above, the restore operation should not be attempted.

## Error conditions

The following is a list of all error messages displayed to the user. If any of these error conditions can be attributed to hardware failures or disk/tape configuration problems, they are logged with the maintenance subsystem. Error messages that are caused by a user entering improper command options are not logged with the maintenance subsystem; the user is notified of the error.

For each error message listed, an identifier is provided that indicates where on the screen the message occurs.

A failure can occur on either processor in a duplicated system. When the error displays, it is associated with the processor on which the error was encountered.

|        |   |
|--------|---|
| E1     | login:cha station 51001 has data locked<br><br>This error message is displayed for the <b>save translation</b> command when there is an active <b>translation update</b> command.   |
| E2 (M) | TTI activation or deactivation is in progress;<br>this command is not allowed at this time<br><br>When TTI activation or deactivation is in progress, <b>save translation</b> cannot occur. The TTI activation or deactivation must be suspended first. |
| E3 (M) | 'loginid': "command" has cmd conflict<br><br>The user logged in with 'loginid' has a command that conflicts with the MSS command you are using.   |
| E4 (W) | No tape in tape drive<br><br>The tape cartridge is missing from the drive.  |
| E5 (W) | Tape write failure: tape cartridge or device failure<br><br>There is a failure in writing to the tape. This may be caused because the tape cartridge is missing from the tape drive, or by non-operational tape hardware.                               |
| E6 (W) | Tape read failure: tape cartridge or device failure<br><br>There is a failure in reading from the tape. This may be caused because the tape cartridge is missing from the tape drive, or by non-operational tape hardware.                              |
| E7 (M) | System error; Reboot<br><br>There was a severe system error while processing this request. This might require system reboot or system technician intervention to resolve.   |

## System Security

# 3

---

### Overview

---

Toll fraud is the theft of long distance service, and can come from both internal and external sources. When toll fraud occurs, your company is responsible for usage charges. In addition, unauthorized use may tie up your system, preventing your customers from reaching you and your employees from doing business.

Lucent Technologies has designed the DEFINITY ECS to help you to limit toll fraud. However, there are steps that you as the administrator must also take to keep your system secure from unauthorized use.

### Learn about the problem

---

The *BCS Products Security Handbook* contains a wealth of information about toll fraud and what you can do to prevent it. It discusses the methods people use to gain access to your system, how to detect toll fraud, and what to do if you suspect that your system has been compromised.

The *BCS Products Security Handbook* contains security information for many Lucent Technologies products, so you can ensure that all of your telecommunications equipment is secure. It also contains security checklists for each of these products. You should go through these with your Lucent Representative for each piece of equipment you use.

### Where to get help

---

For assistance with toll fraud prevention, call the Lucent Technologies National Customer Care Center Support Line at 1-800-643-2353.

If you have identified fraudulent calling in progress, and require assistance in stopping the fraud, call the Lucent Technologies Technical Service Center at 1-800-242-2121 and select the option for toll fraud help.

## Basic security

---

The following is a partial list that you can use to help secure your system. It is not intended as a comprehensive security checklist. The *BCS Products Security Handbook* provides more detail about these and other security-related features.

- When administering logins, enable logoff notification and forced password aging. You must assign passwords for these logins at setup time.
- Administer Security Violation Notification to report unsuccessful attempts to access the system. Security Violation Notification allows you to automatically disable a valid login ID following a security violation involving that login ID and disable remote access following a security violation involving a barrier code or authorization code.
- Use the **list history** command to determine if unauthorized changes have been made to the system. To assist in identifying unauthorized use of the system, the History report lists each time a user logs in or off the system. See *DEFINITY ECS System Monitoring and Reporting* for a detailed discussion of this report.
- Ensure that the Remote Administration port is secure. If it is not secure, an unauthorized user can compromise the system in many ways, such as viewing Barrier and Authorization codes or viewing Feature Access Codes. You can restrict this port to certain login IDs using the Login Administration form. The optional Remote Port Security Device (RPSD) is a password encryption device that can be attached to the Remote Administration Port for increased security.
- If you suspect that unauthorized access has occurred, change the barrier codes, authorization codes, passwords, and any other sensitive codes.
- Secure trunks using Automatic Route Selection, Class of Restriction, Facility Restriction Levels and Alternate FRLs, Authorization Codes, Automatic Circuit Assurance and Forced Entry of Account Codes (see CDR).
- Monitor your system on a regular basis so that you will notice unusual traffic patterns if they occur. Call Detail Recording, Security Violation Notification and a number of reports allow you to do this.
- Activate Enhanced Call Transfer for your voice messaging system, if available. This limits transfers to valid extensions, but you also need to restrict transfers to extensions that may offer dial tone to the caller, such as remote access extensions.

## Physical security

- Keep wiring closets and switch rooms secure.
- Keep any documentation pertaining to switch operation secure.
- Keep any reports that may reveal trunk access code, remote access barrier codes, authorization codes, or password information secure.

## Features requiring security precautions

Follow the guidelines in the *BCS Products Security Handbook* when administering the following features:

- Automated Attendant
- AUDIX Interface
- Call Coverage
- Call Forwarding
- Call Vectoring
- Extended User Administration of Redirected Calls
- Facility Test Calls
- PC Interface
- Personal Station Access
- Remote Access
- Remote Administration
- Service Observing
- Terminal Translation Initialization
- Transfer — Trunk-to-Trunk
- Trunk-to-Trunk Transfer Restriction Override
- Trunk Flash
- Voice Response Integration

Consult the *BCS Products Security Handbook*, for additional steps to secure your system and to find out how to regularly obtain information concerning security developments.

## Basic Features

# 4

---

### Abbreviated Dialing

---

Abbreviated Dialing (AD) provides lists of stored numbers for:

- Placing local, long-distance, and international calls
- Activating features
- Accessing remote computer equipment

Voice-terminal and data-terminal users can access stored numbers from all types of lists: group-number, system-number, enhanced-number, and personal-number via AD numbers. Attendants can access stored numbers from group-number, system-number, and enhanced-number lists via AD numbers. AD numbers can have up to 24 digits. Users can access designated numbers not stored on AD lists via automatic-dialing buttons. Automatic-dialing buttons can have up to 16 digits.

Each stored number is one list entry. Users choose an appropriate list by dialing an access code followed by its 1-, 2-, 3-, or 4-digit list entry number. The number is then dialed automatically by the system. Users may reach a frequently-called number with a single button press by storing the dialing sequence on an AD button.

**How to administer AD**

---

**Detailed description**

**List types**

Numbers are stored in four types of lists: personal-number, group-number, system-number, and enhanced-number. Switch type and version determine available lists and maximum entries per list.

■ Personal-number lists

Personal-number lists are used by voice-terminal and data-terminal users who need a set of stored personal numbers. An individual user can have up to three personal-number lists. You, or the user, program the personal-number lists. You determine which users are allowed to have a personal list and the size of each list. Personal-number lists are created automatically when the capability of accessing a personal list is administered for the individual station.

■ Group-number lists

Group-number lists are used by members of groups such as purchasing and personnel departments, who have the need to frequently dial the same numbers. Voice-terminal users, data-terminal users, and attendants

can access up to three specific group-number lists. You administer the lists. You can choose a designated user in each group to program the list. Specify this user on the Abbreviated Dialing Group List form.

- System-number lists

System-number lists are used by voice-terminal users, data-terminal users, and attendants who need to frequently dial the same numbers as a member of a group (such as members of purchasing or personnel departments). You administer the system-number lists.

- Enhanced-number lists

Enhanced-number lists are used by voice-terminal users, data-terminal users, and attendants who need more list entries than those allowed in group-number and system-number lists. One enhanced-number list is allowed per system in addition to the system-number list. The enhanced-number list can contain any number or dial-access code. You administer the enhanced-number lists and determine which users can access the list.

 **NOTE:**

You can designate all group-number lists, system-number lists, and enhanced-number lists as “privileged.” Calls automatically dialed from a privileged list are completed without class of restriction (COR) or facility restriction level (FRL) checking. This allows access to selected numbers that some voice-terminal users might otherwise be restricted from manually dialing. For example, a voice-terminal user may be restricted from making long-distance calls. However, the number of another office location may be long distance. This number could be entered in a list designated as privileged. The user could then call the office location using AD, while still being restricted from making other long-distance calls.

## List entries

The following describes the numbering schemes used to select a list entry once an AD list is accessed.

### Personal-number list entries

For personal-number lists administered for five or ten entries, the user dials a single digit to access a list entry number. Entries are numbered 1 through 9, and 0 (list entry 10). For example, to access entry 6 the user dials 6, to access entry 10 the user dials 0.

For personal-number lists administered for more than ten entries, the user dials a 2-digit number to access a list entry. For example, to access entry 6 the user dials 06, to access entry 100 the user dials 00.

### Group-number and system-number list entries

AD provides the option of selecting between two group-number and system-number list entry numbering schemes. The type of numbering scheme used is administered on the System-Parameters Customer-Options form.

**Table 4-1. Group-Number and System-number List Entry Numbering Schemes**

| List Entry Number | User Dials (Scheme 1) | User Dials (Scheme 2) |
|-------------------|-----------------------|-----------------------|
| 1                 | 11                    | 01                    |
| 2                 | 12                    | 02                    |
| .                 | ..                    | ..                    |
| .                 | ..                    | ..                    |
| .                 | ..                    | ..                    |
| 10                | 20                    | 10                    |
| 11                | 21                    | 11                    |
| ..                | ..                    | ..                    |
| 89                | 99                    | 89                    |
| 90                | 00                    | 90                    |
| 91                | 01                    | 91                    |
| ..                | ..                    | ..                    |
| ..                | ..                    | ..                    |
| 100               | 10                    | 00                    |

### Enhanced-number lists

The number of digits in enhanced-number list entry numbers can be either three or four digits, as administered on the System-Parameters Feature form.

### Special characters

Digits stored in AD lists include numerical digits and special characters that instruct the system to take specified actions. Special characters count as two digits toward the 24-maximum-allowable digit limit. You and multiappearance voice-terminal users program special characters. Available characters are shown in the following table.

**Table 4-2. Special characters**

| Special Character    | Description   | Function   |
|----------------------|---|--|
| Indefinite Wait (~W) | This means that an indefinite wait follows the indefinite wait character until dial tone is detected.   | <ul style="list-style-type: none"> <li>■ Useful when frequent dial-tone delays of longer than one minute occur</li> </ul>  |
| Mark (~m)            | This means end-to-end signaling digits.   | <ul style="list-style-type: none"> <li>■ Useful when doing touch-tone signaling over dial-pulse trunks</li> <li>■ Place mark characters prior to digits to be outpulsed with touch-tone signaling</li> </ul>   |
| Pause (~p)           | This means that 1.5-second delays follow pause characters when digits are being outpulsed over a trunk. The interval is administrable.                    | <ul style="list-style-type: none"> <li>■ Useful when far-end dial tones from another switch returns within 1.5 seconds</li> <li>■ Used with tandem switching through private networks or end-to-end signaling</li> <li>■ May cause aborted calls if used as the first digit</li> </ul> |
| Suppress (~s)        | This means that digits following suppress characters are not displayed through the voice-terminal display feature. A lowercase s displays for each digit. | <ul style="list-style-type: none"> <li>■ Useful when the user does not want part of a dialed number to be displayed.</li> <li>■ Affects the display of stored-number digits. Digits following suppress characters appear as a lowercase s.</li> </ul>                                  |

*Continued on next page*

**Table 4-2. Special characters — Continued**

| Special Character | Description  | Function   |
|-------------------|--|--|
| Wait (~w)         | This means that a 5- to 25-second delay (or a delay until dial-tone is detected) follows wait characters when digits are being outpulsed over a trunk. The delay is administrable. | <ul style="list-style-type: none"> <li data-bbox="790 333 1145 485">■ Useful when frequent, variable-length dial tone delays or network blocking outside the system is experienced</li> <li data-bbox="790 507 1126 628">■ Used with tandem switching through private networks or end-to-end signaling</li> <li data-bbox="790 650 1145 704">■ May cause aborted calls if used with the first digit</li> </ul> |

### AD access options

AD numbers can be accessed by any of the following options:

- AD codes

Users can access a stored number by dialing the AD feature-access code (FAC) and a list entry number. Each AD code automatically dials the number stored in the list the user accessed.
- AD buttons

Multiappearance voice-terminal users and attendants can access stored numbers by pressing one or more buttons. Each AD button automatically dials the number stored in the list and the list entry number administered to the button.

Access to any list and associated list entry number can be programmed on an AD button on a multiappearance voice terminal. An AD button on an attendant console can be programmed to access a group, system, or enhanced list and associated list entry numbers.

You administer the AD button. If the button is administered to access a number in the user's personal-number list, the user can change the number assigned to the button. If the number assigned to the button accesses an entry on a group list, you or a designated user can make the change. If the number assigned to the button accesses an entry on the system list or the enhanced list, only you can make the change.

- Automatic-dialing buttons

Users can directly dial numbers by pressing one or more buttons. Each automatic-dialing button is administered to automatically dial a number that is not stored on any of the AD lists. The number can have up to 16 characters. You or the user program the automatic-dialing buttons. Autodialing is not affected by AD lists.

- 7103A group-number lists

A separate list, the 7103A group-number list, is used only by 7103A Fixed Feature voice-terminal users as a group. This list allows button access to stored numbers and can have eight list entries. Any number can be stored in the 7103A group-number list; however, it is intended primarily for FACs. You program the 7103A group-number lists.

- Programming

Users can program their personal-number lists, any AD buttons that access a number from their personal-number list, and their automatic-dialing buttons. Only designated users can program an AD button that accesses a number from a group-number list. Programming is done by dial access or by pressing the program button, if assigned.

## End-user operations

### Programming personal lists, AD buttons, and automatic-dialing buttons

- To program an entry in a personal-number list, the user:
  1. Dials the program-access code or presses the program button
  2. Dials the personal-list number, the dial-code number, and the number to be stored (up to 24 digits)
  3. Presses either # or the AD button

Confirmation tone is heard when the number is stored. While in the program mode, users can program all personal-number list entries. To exit the program mode, the user hangs up.

- To program an AD button administered to access a particular entry in the personal-number list, the user:
  1. Dials the program-access code or presses the program button, if assigned
  2. Presses the AD button, dials the number (up to 24-digits)
  3. Presses #

Confirmation tone is heard when the number is stored. In the program mode, the user can program as an unlimited amount of AD buttons (including automatic-dialing buttons). To exit the program mode, the user hangs up.

## Programming group lists

Voice-terminal users can program the group lists to which they are assigned as the designated user. For example, a department secretary may be the designated user for a group list created for the department. Designated users are assigned per group list on the Abbreviated Dialing Group List form. Users who attempt to program group lists for which they are not the designated user receive intercept tone.

The method a designated user uses to program a group list depends on the access codes and buttons administered for the terminal and system. The designated user can program the group list using the:

- Program-access code or AD program button in conjunction with an AD button. In this case, the number to be programmed must be associated with that AD button.
- Program-access code or AD program button when an AD button is not available. In this case, the user can only program lists assigned (as list 1, 2, or 3) to the terminal he or she is using. Other lists for which the user is the designated user cannot be programmed in this way.

Group lists can only be programmed in this way if the *Abbr Dial Programming By Assigned List* field is set to **y** on the *Feature-Related System-Parameters* form.

- AD group list program FAC. When the AD group list program FAC is used to program a group list, the user can program any list for which they are specified as the designated user.

The following instructions describe how designated users program group lists from their voice terminals. You can program group lists on the switch.

- Programming the group list with the AD program-access code or AD program button with an AD button

An AD button can be used by the designated user to program the group list number associated with that button. The user:

1. Dials the AD program-access code or presses the AD program button
2. Presses the AD button, dials the number
3. Presses #

Confirmation tone is heard when the number is stored.

- Programming the group list with the AD program-access code or AD program button (no AD button)

The user:

1. Dials the AD program-access code or presses the AD program button
2. Dials 1, 2, or 3 to select a group list (administered on their station form) followed by the 2-digit list entry number of the entry to be programmed
3. Dials the number
4. Presses #

Confirmation tone is heard when the number is stored.

- Programming the group list with the AD group list program FAC

The user:

1. Dials the AD group list program FAC
2. Dials the 3- or 4-digit group list number to select a group list followed by the 2-digit list entry number of the entry to be programmed
3. Dials the number
4. Presses #

Confirmation tone is heard when the number is stored.

### Programming AD labels on 6400 and 8400 display sets

Users of the 8400- and 6400-series display phones can customize the display labels for Abbreviated Dialing buttons. Messages appear on the display to guide users through the programming of AD numbers and softkey labels. For this feature to work, the speaker must be activated on the phone, and the switch software must be R6.3 or higher.

To program a softkey button, the user:

1. Presses the button labeled Prog, or selects Prog from the softkey menu  

The message `Press button to program` appears on the display.
2. Selects the softkey/feature button to program
3. The message `Change number? Yes=1 No=2` appears.
4. Presses **1** to enter a new number or change an existing one, or **2** to skip this step and move on to programming the label
5. Enters the number for this AD button
6. Presses # to save the number

Confirmation tone is heard when the number is stored. The message `Change label? Yes=1 No=2` appears.

7. Presses **1** to change the label, or **2** to skip this step.

The message `Enter label` appears.

8. Enters the label (up to five characters) using the dial pad. The first time the users presses a key, the first letter on that key appears on the display. For example, if the user presses 2 on the dial pad, the letter A appears. If the users presses 2 a second time, the letter B appears.
9. Presses the \* key to accept the letter on the display and move to the next space.

10. Presses **#** to accept the entire label.

The message `Label saved` appears, followed by `Hang up to update display, and then Press button to program.`

11. Presses another button to program, or
12. Hangs up the phone to exit programming. Pressing the EXIT button does not exit program mode.

 **NOTE:**

If a user makes a mistake while programming, the only way to correct it is to press the “#” key to save the entry, and start over.

Users can follow similar steps to program AD numbers for hardkey buttons. When prompted for the button to program, the user presses the desired hardkey, enters the number, and presses # to save the number.

## Considerations

---

- AD provides easy access to selected numbers by decreasing the number of dialed digits required to place the call. Instead of dialing the entire number, the user dials a short code to access the number. The system then dials the stored number automatically. For frequently called numbers, an AD button or automatic-dialing button can be assigned, allowing the call to be placed by pressing the button. By assigning a privileged list of numbers, a user is allowed to place calls to selected numbers that might otherwise be restricted.
- Users can be assigned access to three AD lists. The three lists can be made up of any combination of up to three personal lists, up to three group-number lists, the system-number list, and the enhanced-number list. A personal list cannot be administered to an attendant console.
- A number stored in any list in the switch can contain up to 24 digits. A special character used for indefinite wait, mark, pause, suppress, or wait counts as two digits.

- A terminal or attendant cannot be removed if it is designated as the extension number that is permitted to program a group-number list.

#### **SECURITY ALERT:**

*Privileged group-number, system-number, and enhanced-number lists provide access to numbers that typically would be restricted.*

## **Interactions**

---

- **Attendant Consoles**  
Automatic-dialing buttons are not allowed on attendant consoles. Attendant consoles do not have access to personal lists.
- **AUDIX Interface**  
When using an AD button to access AUDIX, the user's login and password should not be assigned to the button. The system ignores button entries after the AUDIX number.
- **Bridged Call Appearance**  
A user, accessing AD while on a bridged call appearance, accesses his or her own AD lists. The user does not access the AD lists of the primary extension associated with the bridged call appearance.  
A designated user permitted to program a group-number list is not permitted to program the group list from the bridged call appearance of the designated extension number.
- **Hotline Destination**  
The hotline service destination number is stored in an AD list.
- **Last Number Dialed**  
This feature places a call to the same number as called previously, even if AD was used on the previous call. However, if any special characters (indefinite wait, mark, pause, suppress, and wait) are included in the previous call, they are not used on the last-number-dialed call.  
If the previously called number was in an AD privileged list, and if the user is not normally allowed to dial the number because of his or her class of restriction, intercept treatment is given when using Last Number Dialed. To redial the number, the user must again use the AD privileged list.
- **Remote Access**  
Users can access the group-number, system-number, and enhanced-number AD lists via the remote-access trunk. Users of remote access can access the AD lists administered on the Console form.

## Administered Connections

---

An Administered Connection (AC) is a connection between two access or data endpoints. DEFINITY ECS automatically establishes the connection based on the attributes you administer. ACs provides the following capabilities.

- Support of both permanent and scheduled connections
- Auto Restoration (preserving the active session) for connections routed over Software Defined Data Network (SDDN) trunks
- Administrable retry interval (from 1 to 60 minutes) per AC
- Administrable alarm strategy per AC
- Establishment/retry/auto restoration order based on administered priority

### How to administer Administered Connections

## Detailed description

---

The SDDN provides virtual private-line connectivity using the AT&T Switched Network. Access to the service is provided via an ISDN trunk group whose `Service Type` field is SDDN. The system uses the `Destination` field on the AC form to route calls when AC is active, based on associated authorized time-of-day fields.

Establish an AC between the following:

- Two endpoints on the same switch
- Two endpoints in the same private network, but on different switches
- One endpoint on the controlling switch and another endpoint off the private network

In all configurations, administer the AC on the switch having the originating endpoint. For an AC in a private network, if the two endpoints are on two different switches, normally the connection routes via AAR through tie trunks (ISDN, DS1, or analog tie trunks) and intermediate switches. If required, route the connection via ARS and Generalized Route Selection (GRS) through the public network. The call routes over associated ISDN trunks. When the far-end answers, a connection occurs between the far-end and the near-end extension in the `Originator` field on the AC form.

## Access endpoints

Access endpoints are non-signaling trunk ports. They neither generate signaling to the far-end of the trunk nor respond to signaling from the far-end. Designate an access endpoint as the originating endpoint or destination endpoint in an AC.

## Typical AC applications

The following are typical AC applications:

- A local data endpoint connection to a local or remote-access endpoint. Examples: an MPDM ACCUNET digital service connecting to SDDN via an ISDN trunk-group DS1 port; an MPDM ACCUNET digital service connecting to an ACCUNET Switched 56 Service via a DS1 port.
- A local-access endpoint connecting to a local or remote-access endpoint. Examples: a DSO cross-connect and a 4-wire leased-line modem to a 4-wire modem connection via an analog tie trunk.
- A local data endpoint connecting to a local or remote data endpoint such as a connection between two 3270 data modules.

### NOTE:

The following guidelines do not include AAR and ARS, or GRS administration information for routing AC calls over trunk groups.

See the respective feature elsewhere in this book for that information.

## Establishing Administered Connections

The originating switch attempts to establish an AC only if one of the following conditions exist:

- AC is active.
- AC is due to be active (either a permanent AC or time-of-day requirements are satisfied if it is a scheduled AC).
- Originating endpoint is in in-service or idle state.

If the originating endpoint is not in service or is idle, no activity takes place for the AC until the endpoint transitions to the desired state. The originating switch uses the destination address to route the call to the desired endpoint. When the switch establishes two or more ACs at the same time, the switch arranges the connections in order of priority.

AC attempts can fail for the following reasons:

- Resources are unavailable to route to the destination.
- A required conversion resource is not available.
- Access is denied by COR, FRL, BCC. Or, an attempt is made to route voice-band-data over SDDN trunks in the public switch network.
- Destination address is incorrect.
- Destination endpoint is busy.
- Other network or signaling failures occur.

In the event of a failure, an error is entered into the error log, which generates an alarm, if it is warranted by your alarming strategy. You can display AC failures via the status-administered connection command.

As long as an AC is due to be active, the originating switch continues to establish an AC unless the attempt fails because of an administrative error (for example, a wrong number) or service-blocking condition (for example, outgoing calls barred).

- The frequency with which failed attempts are retried is determined by the administered retry interval (1 to 60 minutes) for each AC.
- Retries are made after the retry interval has elapsed regardless of the restorable attribute of the AC.
- ACs are retried in priority order.
- When you change the time of day on the switch, an attempt is made to establish all ACs in the waiting-for-retry state.

## Dropping Administered Connections

An AC remains active until one of the following occurs:

- The AC is changed, disabled, or removed.
- The time-of-day requirements of a scheduled AC are no longer satisfied.
- One of the endpoints drops the connection. This could be because of user action (in the case of a data endpoint), maintenance activity resulting from an endpoint failure, busying out of the endpoint, or handshake failure. If the endpoints are incompatible, the connection is successful until handshake failure occurs.

### NOTE:

An AC between access endpoints remains connected even if the attached access equipment fails to handshake.

- An interruption (for example, facility failure) occurs between the endpoints.

If an AC drops because it was disabled/removed or is no longer due to be active, no action is taken. If an AC drops because of changed AC attributes, an immediate attempt is made to establish the connection with the changed attributes if it is still due to be active. Existing entries in the error/alarm log are resolved if they no longer apply. If handshake failure resulted in the dropping of the connection, in the case of an AC involving at least one data endpoint, no action is taken for that AC until the change administered-connection command is executed.

## Administered Connections failure: Auto Restoration and Fast Retry

When an active AC drops prematurely, you must invoke either auto restoration or fast retry to determine whether auto restoration is attempted for an active AC.

If you option AC for auto restoration and the connection was routed over SDDN trunks, auto restoration is attempted. During restoration, connections are maintained between the switch and both endpoints. In addition to allowing the active session to be maintained, AC also provides a high level of security by prohibiting other connections from intervening in active sessions. Auto restoration generally completes before the 60-second endpoint holdover interval. If auto restoration is successful, the call might be maintained (no guarantee). The restoration is transparent to the user with the exception of a temporary disruption of service while restoration is in progress. A successful restoration is reflected by the *restored* state on the status AC screen. Although the restoration was successful, the data session may not have been preserved.

If auto restoration is not active or if the AC is not routed over SDDN trunks, the switch immediately attempts to reestablish the connection (fast retry). The switch also attempts a retry if the originating endpoint initiated the drop. With fast retry,

connections are not maintained on both ends. Fast Retry is not attempted for an AC that was last established via fast retry, unless the AC is active for at least two minutes.

If auto restoration or fast retry fails to restore or reestablish the connection, the call drops and the AC goes into retry mode. Retry attempts continue, at the administered retry interval, as long as the AC is due to be active.

## Interactions

---

- **AAR/ARS/GRS**  
Use these features when routing an AC.
- **Abbreviated Dialing**  
Use Abbreviated Dialing entries in the `Destination` field. Entries must comply with restrictions.
- **Busy Verification of Stations and Trunks**  
This feature does not apply to access endpoints because they are used only for data.
- **Call Detail Recording**  
For an AC that uses a trunk when CDR is active, the origination extension is the originator of the call.  
CDR is not available for access endpoints.
- **Class of Restriction**  
Reserve a COR for AC endpoints and SDDN trunks. This restricts endpoints that are not involved in AC from connecting to SDDN trunks or endpoints involved in AC.
- **Class of Service/Call Forwarding**  
Assign to an AC endpoint a COS that blocks Call Forwarding activation at the endpoint.
- **Data Call Setup**  
Do not assign a default dialing destination to a data module when it is used in an AC.
- **Data Hotline**  
Do not assign a hotline destination to a data module that is used in an AC.
- **Digital Multiplexed Interface (DMI)**  
Use DMI endpoints as the destination in an AC. DMI endpoints do not have associated extensions, so do not use them as the originator in an AC.

## 4 Basic Features

### *Administered Connections*

Page 4-19

- Facility Test Calls

The feature does not apply to access endpoints because an access endpoint acts as an endpoint rather than as a trunk.
- Hunting

Do not use a hunt-group extension as the origination extension of an AC.
- Modem Pooling

If you require a modem in an AC, one is inserted automatically. If no modem is available, the connection is dropped.
- Non-Facility Associated Signaling (NFAS) and D-Channel Backup

Auto restoration for an AC that is initially routed over an NFAS facility may fail if the only backup route is over the facility on which the backup D-channel is administered. The backup D-channel may not come into service in time to handle the restoration attempt.
- Set Time Command

When you change the system time via the set time command, all scheduled ACs are examined. If the time change causes an active AC to be outside its scheduled period, the AC is dropped. If the time change causes an inactive AC to be within its scheduled period, the switch attempts to establish the AC.

If any AC (scheduled or continuous) is in retry mode and the system time changes, the switch attempts to establish the AC.
- System Measurements

Access endpoints are not measured. All other trunks in an AC are measured as usual.
- Terminal Dialing

Turn off terminal dialing for data modules involved in an AC. This prevents display of call-processing messages (INCOMING CALL,...) on the terminal.
- Trunk Groups

To invoke auto restoration, route an AC over SDDN trunks. Because a successful restoration depends on a SDDN path, keep some SDDN trunks idle.

## Administrable Language Displays

The Administrable Language Display enables the system to display voice-terminal messages in English, French, Italian, Spanish, or a user-defined language on attendant consoles and voice terminals equipped with 40-character displays.

### How to administer Administrable Language Displays

#### Required forms

| Form                         | Field              | Page                  |
|------------------------------|--------------------|-----------------------|
| Attendant Console            | ■ Display Language | <a href="#">5-35</a>  |
| Station                      |                    |                       |
| — 7404D, 7410D, 7410+        | ■ Display Language | <a href="#">6-90</a>  |
| — 7404D, 7410D, 7410+        | ■ Display Language | <a href="#">6-99</a>  |
| — 7405D                      | ■ Display Language | <a href="#">6-111</a> |
| — 7406D, 7406+, 7407D, 7407+ | ■ Display Language | <a href="#">6-130</a> |
| — 7506D, 7507D, 8510D, 8520D | ■ Display Language | <a href="#">6-180</a> |
| — 8410D, 8434D               |                    |                       |
| Language Translations        | ■ All              | <a href="#">5-193</a> |

### Detailed description

This feature allows you to select a display language for messages that appear on DCP station sets with 40-character displays and on DCP/ISDN-BRI attendant sets. You need to administer one of five language options: English (default), French, Italian, Spanish, or "user-defined." Note that the meanings of the messages do not change, only the language.

To create the user-defined language, translate the English display message set into the desired language via the change display-messages command.

### Feature displays

This section shows the English, French, Italian, and Spanish message for each feature.

#### NOTE:

When the system displays time, only the English language option uses AM/PM notation; all other languages use 24-hour time.

**Table 4-3. Automatic Wakeup**

### Call-Appearance designation

For each display language option, the display to indicate call appearance designation appears as:

"a =" (English)

Call-appearance buttons are designated on the display by a lower-case letter (a through z for the first 26 call-appearances, then A through Z) in position 1, followed by "=".

**Table 4-6. Call Detail Recording**

| English              | French               | Italian                | Spanish                   |

---

1. To enter the day of the week, the user dials 1 for Sunday, 2 for Monday, and so on.

---

## Considerations

---

Users of a 32-character display set cannot choose a display language. These sets (in particular, the hybrid MERLIN 7315H and 7317H sets) default to English.

## Interactions

---

None

## Administration without Hardware

---

Administration without Hardware (AWOH) allows you to perform station translations without specifying terminal port locations. These stations are called AWOH stations until they are associated with a terminal port.

### How to administer AWOH

---

#### Required forms

| Form              | Field                                       | Page                  |

| Hunt Group        | ■ Calls Warning Port<br>■ Time Warning Port | <a href="#">5-158</a> |
| Station           | ■ Port                                      | <a href="#">6-28</a>  |

### Detailed description

---

AWOH streamlines system initializations, major additions, and rearrangements or changes by allowing you to enter station translations without assigning ports. It also allows voice-terminal users, data-terminal users, and technicians to disassociate station translations from the current terminal port and then associate them with another terminal port. Terminal users perform these station disassociations and associations with Personal Station Access (PSA) while technicians use Terminal Translation Initialization (TTI) to perform these tasks.

Because AWOH stations do not have physical terminals associated with them, they cannot generate alarms or errors. In addition, their lamps or alerting tones cannot be affected by the system or other terminals. Likewise, pressing buttons on a physical terminal that is not associated with a station has no affect.

AWOH works the same as administration with hardware translation. For example, when terminals are moved, user-activated features such as Call Forwarding and Send All Calls remain active. Any action that changes the station's status or lamps is reflected once the terminal becomes associated with a terminal.

An AWOH station is considered disassociated when no hardware ports are assigned to the station. To indicate that there is not yet any hardware associated with a station you are administering, set the `Port` fields to `X`. When the port is assigned later, the AWOH station is considered associated.

AWOH allows you to:

- Administer station forms without specifying a port location
- Use phantom extensions to provide call coverage (including AUDIX coverage) for users who do not have stations physically located on the switch
- Use phantom extensions for ACD Dialed Number Identification Service (DNIS). This allows you to administer a phantom extension on the switch for each call type that needs to be identified to ACD agents. Either the phantom extension is Call Forwarded (via Console Permissions) to an ACD split, or its coverage path is defined to include the ACD split. The `Name` field for the phantom extension identifies the service that the caller wants, allowing the agent to properly address the caller.
- Store duplicated stations without specifying a port
- Administer phantom stations so that, with Terminal Translation Initialization (TTI), you can connect to the system by dialing a special digit sequence from the station. Station users use PSA to assign terminals to AWOH stations.

## Interactions

### Voice-terminal interactions

- Abbreviated Dialing

Abbreviated Dialing calls to AWOH stations behave as normally dialed station-to-station calls to AWOH extensions. A station with abbreviated dialing that becomes disassociated retains its list entries.
- Automatic Call Distribution

An AWOH station cannot be logged into an ACD split. The station cannot be logged into an ACD split via a bridged appearance, even if it has a bridged appearance on another station.
- Automatic Callback

Attempting automatic callback to any AWOH station sends reorder tone to the caller, indicating that Automatic Callback cannot be activated.
- Bridged Call Appearance

A normal station (not an AWOH station) that has an appearance of an AWOH station can originate a call on the bridged call appearance. Calls can be made to an AWOH station and answered at any of its bridged appearances on other stations. An AWOH station may contain bridged call appearances, but calls cannot be placed to them.
- Busy Verification of Terminals and Trunks

An AWOH station appears to be out of service when busy verification of terminals and trunks is attempted on that station.

## 4 Basic Features

### *Administration without Hardware*

Page 4-42

- Call Coverage

AWOH stations interact with Call Coverage as if all call appearances are busy. A disassociated station can have Call Coverage active.
- Call Forward

AWOH stations can have Call Forward active while in a disassociated state. When the station is associated, Call Forward remains active.
- Call Park

A call to an AWOH station can be parked only if the primary extension of that station has a bridged call appearance on a normal station (not an AWOH station). A call parked from a bridged call appearance is parked on the primary extension.
- Call Waiting Termination

Call Waiting Termination can be administered on a single-line AWOH station, but the caller receives a busy signal if the station is disassociated.
- Conference

No conferencing of AWOH stations is possible.
- Customer-Provided Equipment (CPE) Alarm

If a CPE alarm is activated for an AWOH station, no equipment is available to ring or light.
- Data Buttons

Data buttons are not lit for AWOH data modules.
- Display

The display for calls originating or terminating from a bridged call appearance for AWOH stations, is the same as for normal bridging.
- Facility Busy Indication

Normal stations can have busy indicator lights for AWOH stations, but the lights are not lit. This is because Facility Busy Indication indicates if a station is off-hook or on-hook, even if you have assigned bridged appearances. A station without hardware translation is always on-hook.

Busy indicator lights can be administered on AWOH stations. When a port is assigned to the station so it is no longer AWOH, busy indicator lights function normally.
- Incoming Destination

If the incoming destination is an AWOH station, the caller hears ringback tone from the central office. Incoming Destination calls are routed based on features active for the station, such as Call Forward and Call Coverage.

## 4 Basic Features

### Administration without Hardware

Page 4-43

- ISDN-BRI voice terminals

If TTI is enabled, you cannot use the SAT to enter **X** in the `Port` field of a BRI voice terminal that is already connected to the switch. Instead, you must dial the TTI disassociate code from the voice terminal. See [“Terminal Translation Initialization” on page 4-583](#) for more information.

- Leave Word Calling

An AWOH station can be left a LWC message.

- Manual Message Waiting

When Manual Message Waiting is activated toward an AWOH station, there is no terminal on which to light the message waiting lamp. However, once the AWOH station is associated with a port or terminal, the message waiting lamp does light.

- Manual Signaling

Manual Signaling to an AWOH station does nothing, since there is no terminal to signal. However, the originator of the manual signal cannot tell that the station is an AWOH station and does not know that the signal is not received.

- Personal Central Office Line

AWOH stations can be administered with PCOL. If a call terminates at an AWOH station with no coverage, the caller receives ringback (no answer). Otherwise, the call routes to coverage.

- Priority Calling

A priority call terminating to an AWOH station hears a busy signal.

- Send All Calls

Send All Calls remains active on AWOH stations.

- Station Hunting

An AWOH station can be in a hunt chain.

- Station-to-Station Call

A call that terminates on an AWOH station is treated like a call to a station with all call appearances busy.

- Transfer

An attempt to transfer to an AWOH station has the same result as an attempt to a busy station would.

## Attendant interactions

- Attendant Group

If all attendants of a group are using AWOH consoles, internal callers receive ringback tone indefinitely. Attendant AWOH consoles behave the same as AWOH stations in group interactions.

## 4 Basic Features

### Administration without Hardware

Page 4-44

- Emergency Access to Attendant

If Emergency Access to the Attendant is activated while all attendants are using AWOH stations, and there is no backup extension or the backup extension is also AWOH, the originating party receives a busy signal.

- Interposition Calling (Attendant to Attendant)

Calls to individual attendants with AWOH stations receive intercept.

- Night Station Service

If an attendant activates Night Station Service, response to the caller depends on the administration of the endpoint. For instance, if the endpoint is a AWOH station, the caller hears a busy signal.

- World Class Attendant

- Attendant Override

If an attendant activates Attendant Override (and therefore bypasses coverage), the attendant hears a busy signal for calls to AWOH stations.

- Attendant Serial Calling

Attempting to extend a call to an AWOH station causes busy signal.

## Data-terminal interactions

- Administered Connections

Endpoints for ACs can be AWOH stations.

- Data Call Setup

- Data Terminal Dialing – A keyboard-dialed call that terminates to a data-endpoint AWOH station causes a BUSY message on the screen, indicating that the terminal is in use, out of service, or AWOH.

- Voice Terminal Dialing – See [“Station-to-Station Call” on page 4-43.](#)

- Hunt-Group (UCD/DDC)

See [“Call Coverage” on page 4-42.](#)

- Incoming Destination

See [“Incoming Destination” on page 4-42.](#)

- Terminal-to-Data Module Call

If a data endpoint is an AWOH station, either BUSY appears on the screen or a busy signal results, depending on the originating hardware. See [“Station-to-Station Call” on page 4-43.](#)

## Association and disassociation interactions

This refers to whether a voice terminal has been assigned a port location. Some of these functions are limited to multibutton sets.

- Attendant

Because the attendant is a central focus for incoming calls, it is advisable to have the attendant in Position Busy mode to route incoming calls. Attendant Priority Queuing ensures that individual attendant access and interposition calling are not reclassified and directed to the attendant group. These calls queue for the attendant and prevent the attendant from disassociating. Any calls queued, held, or seen as active for the attendant prevent the individual attendant from attempting to disassociate while in Position Available mode.

- Attendant Night Service

A night service station cannot be removed while in night service. To remove an endpoint AWOH station while night service is active, See [“Night Station Service” on page 4-44.](#)

- Attendant Release Loop Operation

Calls that are held with the release loop operation by the attendant are reclassified as attendant group calls if the attendant disassociates before the attendant timed-reminder interval expires.

- Automatic Callback

If a station becomes disassociated while a normal station has automatic callback active for the disassociated station, the normal station's automatic callback light turns off and callback sequence is broken.

- Bridged Call Appearance

If a station has a bridged call appearance of an off-hook station, the first station can disassociate at any time and not disrupt a call in progress on the bridge.

If a station with a bridged call appearance associates itself while the extension for the bridged appearance is on a call, the associating station can join the call.

Disassociation cannot be performed from a bridged call appearance. Disassociation (TTI) must be performed from the port on which the station resides.

- Call Coverage

If an AWOH station disassociates while Send-All-Calls or Go-to-Coverage is active, these features remain active.

- Call Coverage Answer Group

If any AWOH station is inserted into translation via TTI or station administration, that station cannot join current calls to the call-coverage answer group. The station can join subsequent calls.

## 4 Basic Features

### *Administration without Hardware*

Page 4-46

- Call Forward

A station can disassociate while Call Forward is active. If a Call Forward destination disassociates, Call Forwarding to that extension remains active.
- Call Park

If a line appearance is available, a station may disassociate while a call to that station is parked, and retrieve the call from another station.
- Call Pickup

If a line appearance is available, a member of a Call Pickup group may disassociate at any time.

If a call is ongoing to any extension in the group, any member of the group can disassociate or associate. That member does not join the group for the ongoing call, but is available for subsequent calls.
- CPE Alarm

If a station that has been administered with a CPE alarm becomes associated with a port while an alarm is active, the station receives the alarm once it is associated.
- Hunt Group UCD/DDC

If any AWOH station endpoint is inserted into translation via TTI or station administration, that station cannot join calls to the hunt group. The station can join subsequent calls.
- Hold

A station user may place a call on hold, disassociate, associate and retrieve the held call.
- Intercom Group — Auto/Dial

See [“Station-to-Station Call” on page 4-46.](#)
- Message Light

Messages need not be deleted before disassociation. If a station receives messages while it is disassociated, when the station receives hardware translation, the message light updates.
- Send All Calls

Send All Calls remains active when a station disassociates.
- Station-to-Station Call

Disassociation is disallowed while a call is in progress.
- Terminating Extension Group

If any AWOH station is inserted into translation via TTI or station administration, that station cannot join current calls to the terminating extension group. The station can join subsequent calls.

## 4 Basic Features

### Administration without Hardware

Page 4-47

- Transfer

After a connection has been made from first to third party, the second party who performed the transfer can disassociate. Parties one and three are treated as a station-to-station call.

- Trunk Group Night Service

If the night service destination is a station, disassociation operates the same as disassociation for stations. See [“Station-to-Station Call” on page 4-46](#). If the night service destination is an attendant, disassociation operates the same as disassociation for attendants. See [“Attendant” on page 4-45](#).

## World Class Attendant interactions

- Attendant Return Call

If the attendant is disassociated upon return from a call that has been extended to a station, the call is reclassified as an attendant group call and routes to the group.

- Serial Calling

In a serial call, the attendant is not in a busy state after releasing a call, and can disassociate. If the attendant is disassociated upon return from a call that has been extended to a station, the call is reclassified as an attendant group call and routes to the group.

## Data modules

Data modules can be associated/disassociated by:

- Data-terminal dialing
- Voice-terminal dialing
- Other devices including using a default set type to associate, and then removing the default set type and replacing it with the proper data endpoint

Because DTDMs reside on some station types, the port is automatically inherited from the host station. The DTDM receives its port identification when the station associates/disassociates.

- Administered Connections

If a connection is administered without hardware translation, the system attempts to establish a connection only when both endpoints are associated with hardware translation.

Administered connections can disassociate by changing the port for the data module to an X, either by administration or via TTI.

## Alphanumeric Dialing

---

Alphanumeric Dialing enhances data-terminal dialing by allowing users to place data calls by entering an alphanumeric name rather than a long string of numbers.

### How to administer Alphanumeric Dialing

---

#### Required forms

---

| Form                       | Field           | Page                 |
|----------------------------|-----------------|----------------------|
| Alphanumeric Dialing Table | ■ Alpha-name    | <a href="#">5-23</a> |
|                            | ■ Mapped String |                      |

---

### Detailed description

---

Alphanumeric Dialing allows a user to place a data call using Data Call Setup and an alphanumeric string or alpha-name for the call-destination address. For example, a user could type 9+1-800-telefon instead of 9+1-800-835-3366 to make a call. Users need to remember only the alpha-name of the far-end terminating point.

Alphanumeric Dialing allows you to change a mapped string (digit-dialing address) without having to inform all users of a changed dial address. Users dial the alpha name.

When a user enters an alphanumeric name, the system converts the name to a sequence of digits according to an alphanumeric-dialing table. If the entered name is not found in the table, the system denies the call attempt and the user receives either an `Invalid Address` message (DCP) or a `Wrong Address` message (ISDN-BRI).

Because data terminals access the switch via DCP or ISDN-BRI data modules, dialing procedures vary:

- For DCP, at the `DIAL:` prompt users type the alphanumeric name and press `Return`.
- For ISDN-BRI, at the `CMD:` prompt users type `d`, a space, and the alphanumeric name, and press `Return`.

## **Considerations**

---

- Alphanumeric dialing does not apply to endpoints with Hayes modems.
- More than one alphanumeric name can refer to the same digit string.

## **Interactions**

---

None

## Alternate Operations Support System Alarm Number

---

Alternate Operations Support System Alarm (OSSA) Number allows you to establish a second number for the switch to call when an alarmable event occurs. This feature is useful to alert a second support organization, such as INADS or OneVision™.

This feature interacts with external trouble tracking and maintenance systems such as:

- INADS
- OneVision™ Network Management Solutions
- PSI (Expert System)
- Trouble Tracker
- Other tools that parse the alarm log entries

### How to administer Alternate OSSA Number

---

#### Required Forms

| Form                                  | Field                              | Page                  |
|---------------------------------------|------------------------------------|-----------------------|
| Maintenance-Related System Parameters | ■ Second OSS Telephone Number      | <a href="#">5-212</a> |
|                                       | ■ Alarm Origination to OSS Numbers |                       |

### Considerations

---

- When the switch processor element (SPE) is down, DEFINITY ECS sends notification and restart history to the first OSS number only. The second OSSA number does not affect attendant console and maintenance board lamp status.
- You can administer the system to have the switch call both numbers in the event of an alarm. If the first number acknowledges the alarm so that the alarm is no longer active, the alarm never reaches the second number.

### Interactions

---

None

## Answer Detection

---

For purposes of call-detail recording, it is important to know when the called party answers a call. DEFINITY ECS provides three ways to determine whether the far end has answered an outgoing call.

- Call Classification — A call-classifier board detects tones and voice-frequency signals on the line and determines whether a call has been answered. This method is fairly accurate. Special Information Tones (SIT) are not detected as answer by the call classifier.
- Network Answer Supervision — The central office (CO) sends back a signal to indicate that the far end has answered. If a call has traveled over a private network before reaching the CO, the signal is transmitted back over the private network to the originating system. This method is extremely accurate, but is not available over most loop-start trunks (for example, CO, FX and WATS trunks in the US).
- Answer Supervision by Timeout — You set a timer for each trunk group. If the caller is off-hook when the timer expires, the system assumes that the call has been answered. This is the least accurate method. Calls that are shorter than the timer duration do not generate call records, and calls that ring for a long time produce call records whether they are answered or not. True answer supervision does not override answer supervision by timeout.

### How to administer Answer Detection

---

#### Required forms for Call Classification

| Form  | Field                                   | Page                  |
|---|---|-----------------------|
| System Parameters Customer-Options                                | ■ Answer Supervision by Call Classifier | <a href="#">5-277</a> |
| System Parameters OCM Call Classification (outside US and Canada) | ■ All                                   | <a href="#">5-289</a> |

#### Required forms for Answer Supervision

| Form         | Field                        | Page                  |
|--------------|------------------------------|-----------------------|
| Trunk Groups | ■ Receive Answer Supervision | <a href="#">7-115</a> |

### Required forms for Answer Supervision by Timeout

---

| Form         | Field                        | Page                  |
|--------------|------------------------------|-----------------------|
| Trunk Groups | ■ Answer Supervision Timeout | <a href="#">7-115</a> |

### Considerations

---

- Call Classification does not always detect all types of tones accurately. For a normal answered call, the call is usually correctly classified as answer. However, some calls may be incorrectly classified as fast busy when they are actually answer.
- Miscellaneous tones, such as confirmation tones, may be classified as answer. In addition, loud background noise may activate Answer Detection, causing a call to be classified as answer even if the call is not connected.
- If Call Classification incorrectly classifies a call as answered, the system still generates a call record. If Call Classification incorrectly classifies a call as answered, and the call is subsequently answered, the call duration reported by CDR includes the time between the incorrect call classification and the actual far-end answer, and the remaining duration of the call.

### Interactions

---

- Call Detail Recording  
Answer Detection provides more accurate call records where tone detection is possible and Network Answer Supervision is not received.
- Call Prompting  
Answer Detection competes with Call Prompting for ports on the call classifier circuit pack.
- CallVisor ASAI  
Answer Detection competes with CallVisor ASAI switch-classified calls for ports on the call classifier circuit pack. Answer Detection triggers reporting of a connect event to ASAI.

## Attendant Auto-Manual Splitting

---

Attendant Auto-Manual Splitting allows the attendant to announce a call or consult privately with the called party without being heard by the calling party on the call. Attendant Auto-Manual Splitting provides for splitting the calling party away so the attendant can confidentially determine if the called party can accept the call.

### How to administer Attendant Auto-Manual Splitting

---

#### Required forms

---

| Form              | Field  | Page                 |
|-------------------|--|----------------------|
| Attendant Console | <ul style="list-style-type: none"><li>■ Feature Button Assignments<ul style="list-style-type: none"><li>— split</li><li>— dont-split</li></ul></li></ul> | <a href="#">5-35</a> |

---

#### Detailed description

---

This feature activates automatically when the attendant, active on a call, presses any of the following:

- The START button
- A Hundreds Select button
- And a Direct Extension Selection button (if provided)
- A Trunk Group Select button

#### Interactions

---

None

## Attendant Backup Alerting

The Attendant Backup Alerting feature allows other system users to pick up attendant calls when the attendant is unable to do so.

### How to administer Attendant Backup Alerting

#### Required Forms

| Form                      | Field                        | Page                  |
|---------------------------|------------------------------|-----------------------|
| Console-Parameters        | ■ Backup Alerting            | <a href="#">5-86</a>  |
|                           | ■ Calls in Queue Warning     |                       |
|                           | ■ Time in Queue Warning      |                       |
| Class of Service          | ■ Client Room                | <a href="#">5-81</a>  |
| Station                   | ■ Feature Button Assignments | <a href="#">6-14</a>  |
|                           | — atd-qcalls                 |                       |
| Feature Access Code (FAC) | ■ Trunk Answer Any Station   | <a href="#">5-113</a> |

### Detailed description

This feature provides both audible and visual alerting to backup stations when the attendant queue reaches its queue warning level. When the queue drops below the queue warning level, alerting stops.

Audible alerting also occurs when the attendant console is in night mode, regardless of the attendant queue size.

### Considerations

- Backup-station users must meet the following criteria to answer alerting calls in the attendant queue by dialing the FAC of Trunk Answer Any Station (TAAS).
  - Be at a multiappearance voice terminal
  - Have the atd-qcall feature button assigned to the station
  - Not have client-room COS. (COS set to no); otherwise, the user receives intercept treatment when trying to use the Attendant Backup Alerting feature
- The atd-qcall feature button provides the visual alerting for this feature. When this button is dark (idle state), there are no calls in the attendant queue. When the button shows a steady light (busy state), there are calls in the attendant queue. When button shows a flashing light (warning

state), the number of calls in the attendant queue exceeds the queue warning. The backup-station user also hears an alerting signal every 10 seconds.

- When the attendant console is in daymode and the Attendant Backup Alerting feature is disabled, visual alerting is as described above. However, no audible alerting signal applies to the backup stations and station users cannot answer attendant calls by dialing the TAAS FAC.

## Interactions

---

- Ringer Cutoff

Activating the Ringer Cutoff feature disables the audible alerting signal. If a backup station has Ringer Cutoff activated, the system audibly alerts the station only when the attendant queue exceeds the queue warning level.

If Ringer Cutoff is not activated, the system audibly alerts the backup station every 10 seconds until the attendant queue falls below the queue warning level.

- TAAS

If the system is in night mode and a TAAS port is not assigned, the attendant can answer queued calls exceeding the queue warning level only by dialing the TAAS FAC.

- Tenant Partitioning

You cannot use Attendant Backup Alerting if `Tenant Partitioning` is enabled on the System Parameters Customer-Options form.

## Attendant Call Waiting

---

Attendant Call Waiting allows an attendant-originated or -extended call to a busy single-line voice terminal to wait at the called terminal. The attendant is free to handle other calls.

### How to administer Attendant Call Waiting

---

#### Required Forms

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Station (Single-Line)             | ■ Att. Call Waiting Indication<br>— att. originating calls | <a href="#">6-28</a>  |
| Feature-Related System Parameters | ■ Attendant Originated Calls                               | <a href="#">5-123</a> |

---

### Detailed description

---

The attendant activates Attendant Call Waiting for a single-line station whenever he or she originates or extends a call to a busy single-line voice terminal. The attendant hears a ringback tone; the busy voice-terminal user hears a single-call waiting tone. The calling voice-terminal user does not hear the tone. You can administer the number of bursts (1, 2, or 3) in the `Attendant Originated Calls` field on the Feature-Related System Parameters form. The default is 2.

When Attendant Call Waiting is activated, the attendant can cancel the call, release the call, or hold the call on the console. However, releasing an attendant-originated call results in dropping the call completely.

If the attendant activates Attendant Call Waiting, and the administered Return Call Time-Out or Timed Reminder on Hold interval expires without the call being answered, the call returns to the console. You administer these intervals on the Console Parameters form.

The attendant can place a call in progress at the voice terminal on hold. After answering the held call, the attendant uses the Hold feature to return to the held call or toggle back and forth between the two calls.

As an example of how to use Attendant Call Waiting, assume that extension 123, a single-line voice terminal, is busy. An attendant extends a call to extension 123 and hears the call waiting ringback tone indicating that Attendant Call Waiting is activated. The attendant can announce the call-waiting condition to the calling party. Alternatively, the attendant can cancel the call and ask the calling party to call again later. Finally, the attendant can release the call or place the call on hold at the console. The user at extension 123 hears a tone and knows a call is waiting. The user can then terminate the call in progress, or place the call in

progress on hold and answer the waiting call. If the waiting call is not answered before a preassigned time interval (Return Call Timeout or Timed Reminder on Hold), the call returns to the attendant.

Attendant Call Waiting, as covered above, also applies to satellite PBX stations via TGU/TGE trunks.

## Considerations

---

- Attendant Call Waiting applies only for calls to single-line voice terminals within the system. Only one call per voice terminal can wait at a time.

## Interactions

---

- Automatic Callback

Activating Automatic Callback at the called voice terminal denies Attendant Call Waiting.

- Call Coverage

Attendant Call Waiting calls redirect to coverage if the called voice terminal has Data Privacy or Data Restriction activated. If one of these conditions exists, and you assign call coverage to a voice terminal, and you activate Send All Calls or coverage criteria are met, the call redirects to coverage. The operation is as follows:

- The Coverage Don't Answer interval specifies how long a call remains directed to the called voice terminal before redirecting to coverage. This interval applies to both the Busy and Don't Answer criteria. Attendant Call Waiting if applicable on the call, is active for the duration of the Don't Answer interval only. At the end of this interval, the call redirects to coverage.
- If the Return Call Timeout (Timed Reminder) interval expires before the Don't Answer interval expires, the call does not go to coverage, but returns to an attendant console. If the Don't Answer interval expires first, the call redirects to coverage, but can still return to the console if a coverage point does not answer the call before the Return Call Timeout.
- If the `Station Hunting` field is assigned and the called station is busy, the call redirects to the Hunt To Station Assignment.
- If Send All Calls is active or if the redirection criterion is Cover All Calls, the call immediately redirects to coverage instead of waiting.
- An attendant can release from an extended call at any point during the call without affecting the preceding operations.

**4 Basic Features**

*Attendant Call Waiting*

*Page 4-59*

- **Data Privacy**  
Activating Data Privacy at the called voice terminal denies Attendant Call Waiting.
- **Data Restriction**  
Activating Data Restriction at the called voice terminal denies Attendant Call Waiting.
- **DDC and UCD**  
Calls to a DDC or UCD group do not wait. However, they can enter the group queue, if provided.
- **Loudspeaker Paging Access**  
Activating Loudspeaker Paging Access at the called voice terminal denies Attendant Call Waiting.
- **Music-on-Hold Access**  
The calling party hears music if the call is a trunk-transferred call administered to receive Music-on-Hold. Otherwise, the calling party hears ringing.
- **Recorded Telephone Dictation Access**  
Activating Recorded Telephone Dictation Access at the called voice terminal denies Attendant Call Waiting.

## Attendant Calling of Inward Restricted Stations

---

A voice terminal with a Class of Restriction (COR) that is inward restricted cannot receive public network, attendant-originated, or attendant-extended calls.

The Attendant Calling of Inward Restricted Stations feature allows you to override this restriction.

### How to administer Attendant Calling of Inward Restricted Stations

---

#### Required forms

---

| Form                 | Field                  | Page                 |

---

## Detailed description

Each attendant console has 12 designated Trunk Hundreds Select buttons usable with Attendant Control of Trunk Group Access. Each console may have up to 12 of its feature buttons administered as additional Trunk Hundreds Select buttons, for a total of 24 buttons. The attendant gains direct access to an outgoing trunk group by pressing the button assigned to that trunk group.

All Trunk Hundreds Select buttons (including any administered on the console's feature buttons) have a busy lamp that lights when all trunks in the associated trunk group are busy. If you administer one of the 2-lamp feature buttons on a basic console as a Trunk Hundreds Select button, use the bottom lamp as the busy lamp. Six of the designated buttons (basic console) or all 12 designated buttons (enhanced console) have two additional lamps used for Attendant Control of Trunk Group Access. The two additional lamps are:

- Warn (warning) lamp  
Lights when a pre-set number of trunks are busy in the associated trunk group
- Cont (control) lamp  
Lights when the attendant activates Attendant Control of Trunk Group Access for the associated trunk group

The attendant activates Attendant Control of Trunk Group Access by pressing a CONTACT (Control Activate) button followed by the desired Trunk Hundreds Select button. The Trunk Group Select button used must have a CONT (control) lamp. If a user attempts to access a controlled trunk group directly, the call automatically redirects to the attendant. If the attendant wants to allow the call to go through, the attendant can connect the user to the desired trunk group by pressing the associated Trunk Group Select button. The attendant then releases the call or holds the call on the console.

Activation of Attendant Control of Trunk Group Access does not affect calls already in the queue for that trunk group. For example, if an attendant activates Attendant Control of Trunk Group Access for a specific trunk group while a user is waiting in queue for an outside trunk in that trunk group, the call is not affected. The call remains in queue until an idle trunk becomes available, at which time the call connects to that idle trunk.

The attendant deactivates Attendant Control of Trunk Group Access by pressing the CONT DEACT (Control Deactivate) button followed by the desired Trunk Hundreds Select button. Attendant Control of Trunk Group Access activates and deactivates separately for each trunk group.

After an attendant presses a CONTACT or CONT DEACT button, the attendant can perform other operations before pressing the desired Trunk Hundreds Select button. This has no effect on the activation or deactivation of the feature. For example, if the attendant presses the CONTACT button and then has to answer

another call, the attendant presses the desired Trunk Hundreds Select button after answering the call, then activates, Attendant Control of Trunk Group Access for the associated trunk group.

## Considerations

---

- By activating Attendant Control of Trunk Group Access, the attendant obtains control of access to specific trunk groups. This allows the attendant to monitor the use of these trunk groups. Watching the lamps associated with the trunk groups, the attendant can determine if the number of busy trunks in a specific trunk group reaches a preset warning level and if all trunks in a specific trunk group are busy. The attendant can then handle other calls to these trunk groups accordingly.
- If Attendant Control of Trunk Group Access is activated and an attendant is not assigned, or if the attendant is later removed, calls to a controlled trunk group route to the attendant queue.

## Interactions

---

- Attendant Direct Trunk Group Selection  
Assign this feature with the Attendant Control of Trunk Group Access.
- Attendant Display  
When a call redirects to the console because Attendant Control of Trunk Group Access activates, the alphanumeric display identifies the calling party and shows that a call is attempting to access a controlled trunk group.
- Authorization Codes  
Authorization codes do not collect when a trunk group has an incoming destination set to the attendant.
- Automatic Route Selection and Automatic Alternate Routing (ARS/AAR)  
Activating Attendant Control of Trunk Group Access removes the controlled trunk groups from the ARS and AAR patterns. Deactivating the feature reinserts the groups into the patterns. ARS calls do not route to the attendant.
- QSIG  
QSIG trunks do not support Attendant Control of Trunk Group Access.
- Trunk Group Busy/Warning Indicators to Attendant  
This feature keeps the attendant informed of trunk-group status. Use this status to determine when to activate control.

**4 Basic Features**

*Attendant Control of Trunk Group Access*

*Page 4-65*

- **Uniform Dial Plan**

Activating Attendant Control of Trunk Group Access removes the controlled trunk groups from preferences. Deactivating the feature enables the UDP to access the trunk groups.

## Attendant Crisis Alert

---

Attendant Crisis Alert sends visual and audible alerting to attendant consoles when an emergency call (such as 911) is placed.

### How to administer Attendant Crisis Alert

---

#### Required Forms

| Form               | Field                       | Page                 |
|--------------------|-----------------------------|----------------------|
| ARS Digit Analysis | ■ call type                 | <a href="#">8-54</a> |
|                    | — alrt                      |                      |
| Attendant Console  | ■ Feature Button Assignment | <a href="#">5-35</a> |
|                    | — crss-alert                |                      |

Note that you can set up any access code for crisis alert. If this feature is installed and administered, a record is also printed on the journal/schedule printer.

### Detailed description

---

Attendant Crisis Alert indicates from where an emergency call is made. This information allows the attendant to direct emergency-service response to the caller.

Audible alerting sounds like an ambulance siren. Visual alerting consists of flashing of the crss-alert button lamp and display of the caller name and extension.

When crisis alerting is active at the attendant console, the console is in position-busy mode so that no other incoming calls interfere with the emergency call. The console can still originate calls. The attendant must press the position-busy button to unbusy the console and the crss-alert button to deactivate audible and visual alerting.

#### How to use Attendant Crisis Alert

| Action          | Lamp     | Ringer | Display    |
|-----------------|----------|--------|------------|
| Emergency alert | Flashing | Siren  | Caller Ext |
| First push      | Flashing | None   | Caller Ext |
| Second push     | Steady   | None   | Caller Ext |
| Third push      | Off      | None   | Cleared    |

## Report

The Emergency Access Calls Report is used to track emergency calls by extension, event, type of call, and time of day. This log prints in the system journal printer with name, time and event code (attendant crisis alert).

To display the Emergency Access Calls Report, enter:

```
list emergency [print/schedule]
```

## Considerations

---

- Only one crss-alert button is allowed per attendant console.
- Consoles without a crss-alert button do not receive emergency notification.

## Interactions

---

- Tenant Partitioning  
If tenant partitioning is active, only attendants within each partition can receive emergency notification from callers within the partition.

## Attendant Direct Extension Selection with Busy Lamp Field

---

Attendant Direct Extension Selection with Busy Lamp Field allows the attendant to track extension status (idle or busy) and to place or extend calls to extension numbers assigned to the system without having to dial the extension number.

### How to administer Attendant Direct Extension Selection with Busy Lamp Field

---

#### Required forms

---

| Form              | Field                                     | Page                 |
|-------------------|---|----------------------|
| Attendant Console | Hundreds Select Button Assignments (1-20) | <a href="#">5-35</a> |

### Detailed description

---

#### NOTE:

An associated DXS lamp for a vector directory number (VDN) is always dark. The DXS button may be used to place a call to a VDN.

The attendant can use this feature in two ways:

- Using standard Direct Extension Selection (DXS) tracking. If your attendant console has one or more Hundreds Select buttons, press a Hundreds Select button and a DXS button to access a station.
- Using Enhanced DXS tracking when:
  - Your attendant console does not use Hundreds Select buttons.
  - Your attendant console uses Hundreds Select buttons, but you have one or more hundreds groups not administered by a Hundreds Select button.

In either case, you can use a Group Select button and dial the first two or three digits of the station and then use the DXS button to access the station. See the Enhanced DXS Tracking subsection below.

In both cases (using a Hundreds Select button or the Group Select button), when the system tracks a group of extensions, the attendant can place or extend subsequent calls to extensions in that group by pressing the DXS button, without having to reselect the group. Both of these capabilities eliminate the need to dial extensions.

Extensions may be voice-terminal extensions, hunt-group extensions, off-switch extensions (such as UDP extensions), or non voice-terminal extensions.

## 4 Basic Features

### *Attendant Direct Extension Selection with Busy Lamp Field*

Page 4-69

Whichever method you use to access and track DXS extensions, view the group of extensions currently being tracked using a Group Display feature button. This button on the console indicates the range of extensions tracked by the selector console.

## Standard DXS Tracking

The basic selector console has 8 Hundreds Select buttons and 100 DXS buttons. The enhanced selector console has 20 Hundreds Select buttons and 100 DXS buttons. You can assign 12 additional Hundreds Select buttons to feature buttons on the attendant console. However, if using these feature buttons, the total number of Hundreds Select buttons per attendant (including both the attendant-console feature buttons and the selector-console buttons) cannot exceed 20. Label each Hundreds Select button with a different hundreds group number used in the system. For example, if a system uses 4-digit extensions, you could label the Hundreds Select buttons 2400, 2500, 2800, and so on. Likewise, you could label a 3-digit system 100, 200, 300, and so on. And you could label a 5-digit system 28400, 28500, 28600, and so on.

The 100 DXS buttons are labeled 00 to 99, and each button represents the last two digits of an extension. Each DXS button, combined with a Hundreds Select button, represents a unique extension. To place a call to an extension, the attendant presses the appropriate Hundreds Select button followed by the appropriate DXS button. For example, to call extension 4321, the attendant presses Hundreds Select button 4300 followed by DXS button 21.

A lamp associated with each Hundreds Select button indicates the selected hundreds group. A selected hundreds group remains selected until you press another Hundreds Select button. The associated lamp lights and remains lighted until you press another Hundreds Select button. Each DXS button also has an adjacent lamp, used to determine the idle/busy active status of the facility associated with the button. When a facility is busy/active, the lamp at the associated DXS button lights. When the associated facility is idle, the lamp is dark. For multifunction voice terminals with a speakerphone or the CallMaster voice terminal, the facility is busy when a user is active on a call appearance (talking or originating a call) and idle when all call appearances are idle, ringing, or held. For other voice terminals, the facility is busy when the station is off-hook and idle when the station is on-hook.

Although the Group Select and DXS buttons may be used to dial any extension, the Busy Lamp field reflects the status of on-switch resources.

After the attendant presses the Hundreds Select button, if the lamp adjacent to the desired DXS button is lighted to indicate busy status, the attendant can sometimes still place or extend the call or can activate Attendant Call Waiting for a single-line voice terminal. A multiappearance voice terminal user receives the call on an idle appearance. If no idle appearance becomes available, the call routes to coverage, or receives busy tone when coverage is not available.

## Enhanced DXS Tracking

Enhanced DXS Tracking can help you if you have more than 100 stations, but you use a console that does not have Hundreds Select buttons administered. It can help if you have more stations than you do Hundreds Select buttons (and thus have hundreds groups that are administered with Hundreds Select buttons). This means that, if you have the basic selector console but have more than 800 stations, or if you have the enhanced selector console but have more than 2000 stations, you can still use the selector console to track the extra unadministered stations and extend calls to them.

To do this, you must have a Group Select feature button. This button allows you to track and extend calls to stations that do not have Hundreds Select buttons administered. This button is useful if the attendant prefers to use the dial pad to access a group of stations rather than press a Hundreds Select button.

The Group Select feature button works for extensions of 3-, 4-, or 5-digits (extensions 100 through 99999).

### NOTE:

Enhanced DXS Tracking supports only stations that reside on the same PBX as the attendant console. The attendant can extend calls to another DCS switch via Enhanced DXS Tracking, but the DXS console does not show busy or idle status of stations on the other switch.

To view extension status or extend calls using the Group Select button, press the Group Select button, dial the 2- or 3-digit prefix of the extension you want, and press the # button. The lamps on the selector console light for all extensions in that group that are busy. For example, to view the status of extension 84463, press the Group Select button, dial **844**, and press the pound # button. The lamps on the selector console indicate busy extensions for the group 84400-84499. You can now handle the call as normal. If you want to extend the call to a station in the group, press the DXS button for that station.

If you press any Hundreds Select button on the DXS module and the console currently is in the Group Select mode, the console reverts to normal mode.

## The Group Display Button

You can administer a Group Display button to help you track extension status. The button enables you to see which group of extensions the system currently tracks. Press this button and the system indicates on the display panel the range of extensions currently tracked by the selector console.

### NOTE:

Administer the Group Display button for either the feature area or the display area of the console.

## 4 Basic Features

### *Attendant Direct Extension Selection with Busy Lamp Field*

Page 4-71

If you select this button, the system identifies the digits associated with a Hundreds Select button — unless it finds no Hundreds Select button is lit, in which case it identifies the digits last entered with the Group Select button. The system continues to track the selected group of extensions until you either press a Hundreds Select button, or press the Group Select feature button and dial the prefix for the new extension group and the # button. In either case, the system tracks the new group of stations.

## Considerations

---

- With the Attendant Direct Extension Selection with Busy Lamp Field, the attendant can place calls to 800 extensions using the basic selector console, 2000 extensions using the enhanced selector console or up to 99999 extensions using the Group Select feature button (extension numbers from 100 to 99999). If the desired hundreds group is being tracked with either a Hundreds Select button or the Group Select feature button, the attendant presses the desired DXS button to access a station.
- This feature provides the attendant with a visual indication of the idle/active status of the extension numbers assigned to the selected hundreds group. Up to 100 extensions can be monitored for idle or active status at a time.
- Enhanced DXS Tracking does not support extensions with fewer than three digits.
- Station tracking is possible only for the PBX on which the attendant resides.

## Interactions

---

- **Attendant Display**  
When the attendant uses the Attendant Direct Extension Selection with Busy Lamp Field, the alphanumeric display identifies the call through the Attendant Display.
- **Call Coverage**  
If Send All Calls is activated, or if the Call Coverage redirection criteria are met, then an extended call redirects to the coverage path.
- **Centralized Attendant Service**  
When the attendant uses a DXS button to make a CAS call, it takes a few seconds before the attendant hears ringback tone.

## Attendant Direct Trunk Group Selection

---

Attendant Direct Trunk Group Selection allows the attendant to access an idle outgoing trunk.

### How to administer Attendant Direct Trunk Group Selection

---

#### Required forms

---

| Form              | Field   | Page                 |
|-------------------|---|----------------------|
| Attendant Console | ■ DTGS Button Assignments (TAC) (1-12)<br>— local-tgs | <a href="#">5-35</a> |

---

#### Detailed description

---

You can use up to 12 designated Trunk Hundreds Select buttons on each console. In addition, you can administer up to 12 of the feature buttons as additional Trunk Hundreds Select buttons, for a total of 24 Trunk Hundreds Select buttons per console. Each button allows the attendant direct access to an outgoing select trunk group.

While an attendant is talking on a call, that call can be split away and a new call placed to the outgoing trunk specified by the trunk group select button. The attendant can then press Release to connect the split-away parties to the trunk's dial tone, or the attendant can dial the destination and press Release to connect the split-away party to the called party.

All Trunk Hundreds Select buttons (including any administered on the feature buttons) have a Busy lamp that lights when all trunks in the associated trunk group are busy. If you administer one of the 2-lamp feature buttons on a basic console as a Trunk Hundreds Select button, use the bottom lamp as the Busy lamp. Six of the designated buttons (basic console) or all 12 designated buttons (enhanced console) also have a Warn (warning) lamp and a CONT (control) lamp. The Warn lamp lights when a preset number of trunks in the associated trunk group are busy. The Cont lamp lights when the attendant activates Attendant Control of Trunk Group Access for the associated trunk group.

You can assign Loudspeaker Paging zones rather than trunk groups to Trunk Hundreds Select buttons. The Busy lamp then indicates the idle/busy status of the associated Loudspeaker Paging zone.

## **Considerations**

---

- Attendant Direct Trunk Group Selection eliminates the need for the attendant to memorize, or look up, and dial the trunk-access codes associated with frequently used trunk groups. A label associated with each Trunk Hundreds Select button identifies its destination or use — for example, Chicago, FX, or WATS. Pressing the button selects an idle trunk in the desired group.

## **Interactions**

---

- Attendant Control of Trunk Group Access  
If Attendant Control of Trunk Group Access is provided, this feature must also be provided.
- QSIG  
Attendant Direct Trunk Group Selection does not apply to QSIG trunks.

## Attendant Display

---

The Attendant Display feature shows call-related information on the alphanumeric display that helps the attendant operate the console more efficiently. It also shows personal-service and message information.

### How to administer Attendant Display

---

#### Required forms

---

| Form              | Field                        | Page                 |

| Attendant Console | ■ Feature Button Assignments | <a href="#">5-35</a> |
|                   | — call-disp                  |                      |
|                   | — type-disp                  |                      |
|                   | — cov-msg-rt                 |                      |
|                   | — date-time                  |                      |
|                   | — delete-msg                 |                      |
|                   | — timer                      |                      |
|                   | — inspect                    |                      |
|                   | — directory                  |                      |
|                   | — next                       |                      |
|                   | — normal                     |                      |
|                   | — stored-num                 |                      |
|                   | — class-rstr                 |                      |

---

### Detailed description

---

The system allows the attendant to select either American English (default), French, Italian, Spanish, or user-defined language displays. See [“Administrable Language Displays”](#) for more information.

Assign the following display modes to the eight buttons in the display area of the console, or to any programmable feature button on the console. The system also provides Normal and Test modes; the other modes are optional.

- Normal

Displays call-related information for the active call appearance. The alphanumeric display is in normal mode unless the attendant selects another mode. The display must be in normal mode to answer incoming calls.

- Inspect  
Displays call-related information for a call on hold or an unanswered call
- Stored Number  
Displays the number to a button administered through the Facility Busy Indication feature or the number assigned to an Abbreviated Dialing button.
- Date/Time  
Displays the current date and time of day
- Test  
Displays a test pattern representing each of the 40 characters. The lamp test switch on the console does not require an additional button assignment.
- Elapsed Time  
Displays elapsed time in hours, minutes, and seconds. Pressing the button starts or stops timing.
- Integrated Directory  
Turns off the touch-tone signals and allows use of the touch-tone buttons to key in the name of a system user. After a name is keyed in, the display shows that name and associated extension.
- Coverage Message Retrieval  
Retrieves and displays Leave Word Calling and Call Coverage messages for system users. Messages can be retrieved at any time. The attendant can be active on a call and still retrieve messages.

Assign three additional buttons to the console when assigning the Coverage Message Retrieval mode or the Integrated Directory model:

- Next Message  
Retrieves and displays the next message, displays NO MESSAGES, or displays END OF MESSAGES, (PUSH Next TO REPEAT) when in the Coverage Message Retrieval Mode. Displays the next name in the alphabetical listing when in the Integrated Directory mode. Assign this button when assigning the Retrieval button.
- Call Display  
Automatically returns the call requested by the currently displayed message or the currently displayed name and extension number. This button is optional.
- Delete  
Deletes the currently displayed message. Assign the Delete button when assigning the Retrieval mode button. This button is not used with Integrated Directory.

You can administer a Call Type button for the attendant console. When the attendant presses the Call Type button, the system displays the call type of the active call. The call type appears for one second and then the display returns to normal mode. The following are the three possible call types:

- Call Type 1: an outgoing public network call that receives answer supervision when the Answer Supervision Timer of the trunk group expires, even if the trunk is actually still ringing. An incoming call classifies as Type 1 when it is answered.
- Call Type 2: an incoming external public network call before it receives answer supervision or before the Answer Supervision Timer of the trunk group expires.
- Call Type 3: all other calls — all internal calls, conference calls, and tie trunk calls of any type.

## **Call-Related Information**

### **Call Appearance Identification**

The display labels the attendant call-appearance buttons alphabetically.

### **Calling Party Identification**

When a call is from a system user, the display shows the caller's name or a unique identification administered for the voice terminal used, along with the calling party's extension. When the call is from outside the system, the display shows the trunk identification, such as CHICAGO, and the trunk access code assigned to the trunk group used for the call.

When a call comes from an ISDN trunk group, additional information may be provided.

### **Called Party Identification**

On internal calls, the display shows the digits as dialed. After dialing is completed, the display shows the called party's name and extension. If no name is assigned, only the extension displays.

On outgoing calls, the display shows the digits as dialed or the name and trunk access code assigned to the trunk group being used. You can suppress the name of any trunk group.

When a call comes from an ISDN trunk group, additional information may be provided.

### Internal class of restriction

All system users have a class of restriction (COR) to define their calling privileges. The COR is a 2-digit number followed immediately by a hyphen and a 4-character identifier. Press a COR button to display a user's COR. COR identifiers are:

### Call Progress Feedback

**Table 4-32. Call Progress Feedback**

| Class of Restriction | Identifier              |
|----------------------|-------------------------|
| ORIG                 | Origination restriction |
| OTWD                 | Outward restriction     |
| TOLL                 | Toll restriction        |
| CODE                 | Code restriction        |
| NONE                 | No restriction          |

The system presents Call Progress Feedback including ringing, busy, and call waiting.

### Call Purpose

This refers to calls directed, redirected, or returning to the console. The English language call-purpose identifiers are:

**Table 4-33. Call Purpose**

| Identifier                                   | Purpose   |
|--|---|
| an – Attendant No Answer                     | Indicates that a redirected call went to another attendant because the attendant no answer and attendant alerting interval timers expired.                                    |
| co – Controlled Outward Restriction Call     | Indicates a redirected call from an internal user to the attendant. The voice terminal is administered for Controlled Outward Restriction and tried to make an outgoing call. |
| ct – Controlled Termination Restriction Call | Indicates a redirected call to the attendant. The voice terminal is administered for Controlled Termination Restriction and the calling party tried to call the terminal.     |

*Continued on next page*

**Table 4-33. Call Purpose — Continued**

| Identifier   | Purpose  |
|--|--|
| cs – Controlled Station-to-Station Restriction Call  | Indicates a redirected call from an internal user to the attendant. The voice terminal has Controlled Station-to-Station Restriction and tried to make a station-to-station call.  |
| da – DID Recall  | Indicates that the central office operation activated the DID recall feature when the switch disconnected first from an incoming DID call placed by the operator. The resulting call routes to the attendant group. DID Recall is used only in some countries. |
| hc – Held Call   | Indicates that a call held by the attendant is left on hold longer than the held call timeout value  |
| ic – Intercept Call  | Indicates a redirected incoming call to the attendant as a result of Intercept Treatment (defined attendant as default on System Parameter Features form).   |
| ip – Inter-Position Call   | Indicates an incoming call to the attendant's individual extension by another attendant. ip does not display at the terminating attendant console if permissions for the associated COS field are set to <b>n</b> .  |
| <p> <b>NOTE:</b><br/>“ip” does not display at the terminating attendant console if <code>Console Permissions</code> fields on the associated Class of Service are <b>n</b>.</p> |  |
| ld – DID LDN Call  | Indicates that an incoming call is a listed-directory-number (LDN) call on a DID trunk   |
| n – night service  | Indicates call routing to the attendant due to night service on a trunk group or hunt group  |
| na – no answer   | Indicates an unanswered incoming DID call for longer than the no answer timeout value  |
| p – Call Pickup  | Indicates that the attendant answered a call via the Call Pickup feature   |
| pc – Personal Call   | Indicates an incoming call to the attendant's individual extension, and not to the attendant group   |

*Continued on next page*

**Table 4-33. Call Purpose — Continued**

| Identifier          | Purpose  |
|---------------------|--|
| rt – Returned Call  | Indicates an unanswered attendant-extended call within the administered interval. The call returned to the console.    |
| qf – Queue Full     | Indicates redirection of a call to the attendant (or switch) because the emergency queue is full                       |
| rc – Recall Call    | Indicates that an internal user, active on a call held on the console, requests attendant assistance                   |
| sc – Serial Call    | Indicates a serial call  |
| tc – Trunk Control  | Indicates that an internal user tried to access an attendant-controlled trunk. The call was redirected to the console. |
| f – Call Forwarding | Indicates that an internal user has calls forwarded automatically to the attendant                                     |

### Call Coverage

When the Call Coverage feature is active and the attendant is a covering user, the following call-purpose identifiers display:

**Table 4-34.**

| Identifier                | Purpose  |
|---------------------------|--|
| s – Send All Calls        | Indicates the called party is temporarily sending all calls to coverage.   |
| d – Don't Answer or Cover | Indicates a called party sent a call to coverage, or party is not available. It also indicates that the called party has a temporary bridged appearance of the call. |
| b – Busy                  | Indicates the called party is active on a call, and the party has a temporary bridged appearance of the call.  |

*Continued on next page*

Table 4-34. — Continued

| Identifier       | Purpose   |
|------------------|---|
| B – Busy         | Indicates the called party is active on a call, and the party does not have a temporary bridged appearance of the call. All calls to single-line voice terminals that go to coverage display B. |
| c – Cover All    | Indicates the called party has all calls redirected to coverage.  |
| sc – Serial Call | Indicates an incoming call is a serial call.  |

### Sample displays

The attendant console has a 1-line 40-character alphanumeric display. Some typical displays follow:

Internal call originated by the attendant:

a=3602

then

a= TOM BROWN 3062

or

a= EXT 3602 3602

Outgoing trunk call originated by the attendant:

b=87843541

Where 8 is the trunk-access code and 784-3541 is the number dialed.

then

b= OUTSIDE CALL 8

or

b= WATS 101

Where 101 is the trunk-access code of the outgoing-trunk group.

Incoming-trunk call to the attendant:

4 Basic Features  
Attendant Display

Page 4-81

a= OUTSIDE CALL 102

Where 102 is the trunk-access code of the incoming-trunk group.

Conference call originated by the attendant:

b= CONFERENCE 4

Where 4 is the number of conferees, not including the attendant.

Internal call redirected to coverage:

b= EXT 3174 to EXT 3077 d

or

b= BOB SMITH to JOYCE THOMAS d

Where d indicates that Go to Cover activates by the calling party.

Incoming-trunk call redirected to coverage:

b= OUTSIDE CALL to DON SMITH s

Where s indicates that Send All Calls activates by the called party.

Coverage Message Retrieval:

IN PROGRESS

then

dial extension

MESSAGES FOR BETTY R. SIMS

then

JOE JONES 10/16 11:40a 2 CALL 3124

This display shows that Joe Jones called Betty R. Sims on October 16. The system stored the message at 11:40 a.m. Joe wants Betty to call his extension, 3124.

Integrated Directory mode:

CARTER, ANN 3408 3

This display shows the name and extension administered in the system. The 3 indicates that three buttons were pressed to reach this particular display.

## Considerations

---

- If the attendant group is administered for system-wide message retrieval, attendants can retrieve messages for all voice-terminal users. Permission to have coverage message retrieval can also be administered for the voice-terminal user. It is not possible for selected attendants to retrieve messages for selected voice-terminal users.
- The display must be in normal mode for the attendant to answer incoming calls.
- A call from the primary extension or a bridged call appearance of the primary extension displays as a call from the primary extension.

## Interactions

---

- Hospitality

With Hospitality Services administered, incoming trunk calls that return to the attendant unanswered after being extended by the attendant to a client room do not have the standard return call display. Rather, they show the client name and room number along with the rt Indicator. Client-room calls to the attendant that return to the attendant after being extended to a second client room display the client name and room number with a ex Reason Indicator. The ex Reason Indicator does not appear for any other type of call.

## Attendant Intrusion

---

Attendant Intrusion (Call Offer) allows an attendant to intrude on an existing call to offer a new call or message to the intruded party.

### How to administer Attendant Intrusion

---

#### Required forms

---

| Form              | Field                                       | Page                 |
|-------------------|---|----------------------|
| Attendant Console | ■ Feature Button Assignments<br>— intrusion | <a href="#">5-35</a> |

---

### Detailed description

---

- Upon the attendant's release from the intruded call, the source party shows as Call Waiting at the intruded party's analog voice terminal or is sent to an available line appearance on a digital voice terminal.

#### NOTE:

If there is already a call waiting call on the intruded party's terminal, the source party (split from the attendant) cannot wait at the intruded party's terminal because only one call can be call waiting at a time.

### Interactions

---

- Intrusion is denied in the following cases:
  - A station is on a conference call with administered maximum number of conferees
  - A call is established with Data Privacy activated
  - Establish a call with Data Restriction activated
  - A station is a forward-to point of another station
  - A station is busy talking to another attendant
- If a call is already call waiting for the intruded party, the source (split from attendant) party cannot wait for the intruded party using Call Waiting.
- The attendant display shows the character '1 wait' or '1 busy' if an intrusion is possible. Otherwise, the display shows 'wait' or 'busy'.
- The system provides Attendant Intrusion on remote stations via TGU/TGE trunks (Italy only).

## Attendant Override of Diversion Features

---

Attendant Override of Diversion Features allows an attendant to bypass call-diversion features invoked by and associated with a dialed extension. A diversion feature is any feature that, when activated, causes a call to alert at a point different from the dialed station. Send All Calls, Call Coverage, Call Forwarding All Calls, and Call Forwarding Busy/Don't Answer are diversion features.

### How to administer Attendant Override of Diversion Features

---

#### Required forms

---

| Form              | Field                                      | Page                 |
|-------------------|--|----------------------|
| Attendant Console | ■ Feature Button Assignments<br>— override | <a href="#">5-35</a> |

---

### End-user procedures

---

To invoke this feature, press the **VERRIDE** button. The **VERRIDE** lamp lights.

Press the **CANCEL**, **RELEASE**, or **FORCED RELEASE** button during dialing, to deactivate the feature. If you press the **VERRIDE** button again, the lamp goes out. The feature also deactivates when the call to the dialed extension terminates, or if a trunk-access code is dialed.

The system allows activation or deactivation of the override feature while dialing.

### Considerations

---

- Use this feature together with the Attendant Intrusion (Call Offer) feature to get an emergency or urgent call through to a station user.

### Interactions

---

- Centralized Attendant Services  
Centralized Attendant Services function as usual in conjunction with this feature.

## Attendant Priority Queue

---

Attendant Priority Queue allows attendants to answer calls by call category (for example, by trunk type). You can order calls as received into a category or by call type within the category.

### How to administer Attendant Priority Queue

---

#### Required forms

---

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Console Parameters                | ■ Queue Priorities  | <a href="#">5-86</a>  |
| Feature-Related System Parameters | ■ Reserved Slots for Attendant Priority Queue (page 3)      | <a href="#">5-123</a> |
| Language Translations             | ■ Miscellaneous-Features<br>— Page 5 - Number 46, Call Type | <a href="#">5-193</a> |

### Detailed description

---

Attendant Priority Queue handles incoming calls to an attendant when the call cannot be immediately terminated to an attendant. These calls are placed in the Attendant Priority Queue in order of priority queue level and timestamp within that level. The calling party hears ringback until an attendant answers the call.

### Priorities by Call Categories

You assign a priority queue level to each of the 12 incoming attendant call categories. Each category has a default level. You can reset the level for any category.

The attendant call categories are:

- Emergency Call to the Attendant Group — A call from a station user who dials the emergency access code (default is highest-priority level)
- Assistance Call to the Attendant Group — A call from a station user who dials the attendant-group access code, or from a station that has the Manual Originating Line Service feature activated
- Attendant Group Call over a CO/FX/WATS Trunk — An incoming trunk call to an attendant group (not including trunk calls returned to the attendant group after a timeout or deferred attendant recall)
- Attendant Group Call over a DID Trunk — As above except for a DID trunk

## 4 Basic Features

### Attendant Priority Queue

Page 4-86

- Attendant Group Call over a Tie Trunk — As above except for a tie trunk (dial-repeating or direct types)
- Redirected DID or Redirected ACD Call — A DID or ACD call that times out due to ring/no-answer, busy condition (if applicable), or Number Unobtainable and reroutes to the attendant group
- Redirected Call — A call assigned to one attendant, but redirected to the attendant group because the attendant is now busy
- Attendant Return Call — A call returned to the attendant after it times out. If the attendant is now busy, the call redirects to the attendant group.
- Serial Call — A call from the Attendant Serial Call feature when an outside trunk call (designated as a serial call by an attendant) is extended to and completed at a station, and then the station user goes on-hook. If the attendant who extended the call is busy, the call redirects to the attendant group.
- Individual Attendant Access Call — A call from a station user, incoming trunk call, or a system feature to the Individual Attendant Access (IAA) extension of a specific attendant. If the attendant is busy, the call queues until the attendant is available.
- Interposition Call — A call from one attendant to the Individual Attendant Access (IAA) extension of another attendant
- Miscellaneous Call — All other calls

You can assign the same priority level to more than one category. Assigning all categories the same priority level creates a first-in first-out queue.

When at least one call queues in the Attendant Priority Queue, the Calls Waiting lamp lights steadily on all active attendant consoles. If the number of calls in the queue reaches the attendant-group calls-waiting threshold, the Queue Warning lamp lights steadily on all active attendant consoles.

## Priority by Call Type

You can further define the priority assigned to calls in the Attendant Priority Queue by call type. Then, within each call type, prioritize calls by time (first-in first-out). The call types, in descending order of priority, are:

- Type 1 call: outgoing public-network calls receive answer supervision when the Answer Supervision Timer of the trunk group expires, even if the trunk is actually still ringing. Also, incoming calls when answered by the attendant.
- Type 2 call: incoming external public-network calls before they receive answer supervision or before the Answer Supervision Timer of the trunk group expires
- Type 3 call: all other calls (internal calls, conference calls, and tie-trunk calls of any type)

Note that external public-network calls have priority over all other calls including conference calls. And, answered public-network calls have priority over those calls not yet answered.

You can assign a Call Type button on the attendant console. Pressing this button displays the call type of the active call.

## Considerations

---

- An incoming call that defaults to an attendant and redirects to the attendant group, does not change the associated Attendant Priority Queue level. The reason-code display on the answering attendant's display remains the same as the code on the original attendant's display.

## Interactions

---

- **Multiparty Calls**  
The system always treats multiparty calls as Type 3 calls. If a multiparty call becomes a single-party call while in the queue it remains a Type 3 call.
- **Night Service — Hunt Group**  
When you use Night Service-Hunt Groups, retrieve calls from the hunt groups rather than the Attendant Priority Queue. Since call-type prioritization does not apply to hunt groups, do not retrieve calls in order of call-type unless you designate the Attendant Priority Queue as the termination.
- **Off Premises Station**  
Always identify calls from off-premises stations as Type 3 calls.

## Attendant Recall

---

Attendant Recall allows voice-terminal users on a 2-party call, or on an attendant conference call held on the console, to recall the attendant for assistance.

Single-line users press the RECALL button or flash the switch hook to recall the attendant.

Multiappearance users press the Conference or Transfer button to recall the attendant.

### How to administer Attendant Recall

---

None required

### Interactions

---

- Individual Attendant Access

If a user is holding a hunt-group call to an individual attendant on the console, a system user active on the call cannot recall the attendant. However, the user can transfer calls or make conference calls.

## **Attendant Release Loop Operation**

---

Attendant Release Loop Operation allows the attendant to hold any call off the console (such as a call extended to a busy single-line voice terminal or to a voice terminal that does not answer). The attendant is free to handle other calls.

### **How to administer Attendant Release Loop Operation**

---

None required

### **Detailed description**

---

When an incoming call arrives on a call appearance at an attendant console and is answered, extended, and released by the attendant, the call releases from that call appearance. The console is then available to receive the next call.

Timed Reminder (return-call Time-Out) starts once the call is off the console. If the called terminal or coverage-point user does not answer before the administered interval expires, the call returns to the attendant queue. The special recall tone applies and the alphanumeric display shows the call identification. Normal recall calls (for example, calls exceeding the Attendant Time Reminders on Hold setting) have normal ringing. You can administer either secondary ringing (recall ringing) or primary ringing (incoming call ringing).

Timed Reminders tries to return the call to the attendant who first handled it; if that attendant is unavailable, the call returns to the queue. The called station is no longer notified of the call.

### **Considerations**

---

- Attendant Release Loop Operation improves attendant efficiency by allowing the attendant to release from a call without having to wait for an answer.

### **Interactions**

---

- Attendant Display  
This feature provides call identification.
- Timed Reminder  
This feature provides a timed reminder tone and a return-call Time-Out interval.

## Attendant Serial Calling

---

Attendant Serial Calling enables the attendant to transfer trunk calls that return to the same attendant after the called party hangs up. Once outside callers reach an attendant, they can use the same line into the switch for multiple calls.

### How to administer Attendant Serial Calling

---

#### Required forms

---

| Form              | Field  | Page                 |
|-------------------|--|----------------------|
| Attendant Console | ■ Feature Button Assignments<br>— serial-cal | <a href="#">5-35</a> |

---

### Detailed description

---

Attendant Serial Calling is useful if trunks are scarce and Direct Inward Dialing services are unavailable. An outside caller may have to redial often to get through because trunks are so busy.

The attendant's display shows if a return call is a serial call. The code displayed is `sc`.

Attendant Serial Calling remains activated until either the trunk drops from the switch or the attendant deactivates the feature manually (by pressing the Serial Call button). Once the attendant answers the serial call, the lamp associated with the serial call button lights. If an attendant receives a serial call but has no Serial Call button, the attendant cannot deactivate the feature until the trunk hangs up or until an attendant with a Serial Call button takes control of the call.

If no attendants are available, then the call goes to the attendant's priority queue.

### Considerations

---

- Only attendants can activate this feature.
- The Attendant Serial Calling feature is valid only on calls that have only one trunk on the connection. You can administer only one Serial Call button per attendant console.
- You can activate the feature on a conference call as long as only one trunk is on the conference.

## Interactions

---

- Centralized Attendant Services  
Attendant Serial Calling does not work with Centralized Attendant Services.
- DCS  
Attendant Serial Calling works in a DCS environment only if the attendant activates it on the same node as the trunk to which the attendant is connected. Do not conference the incoming trunk call with a DCS party when activating. This would put two trunks on the connection.
- Priority Queue  
A special priority exists for serial calls.

## Audible Message Waiting

---

Audible Message Waiting places a stutter at the beginning of a station dial tone on a station that has a message waiting. Audible Message Waiting is particularly useful for visually impaired people who may not be able to see a message light.

Messages for a station can be waiting in system memory (to be accessed via display or voice synthesizer), Property Management System (PMS), Message Servicing Adjunct (MSA), or AUDIX.

Audible Message Waiting is typically, but not necessarily, used on voice terminals without message-waiting lights. Often these are analog terminals.

### How to administer Audible Message Waiting

---

#### Required forms

---

| Form                             | Field                     | Page                  |
|----------------------------------|---------------------------|-----------------------|
| System Parameter Customer-Option | ■ Audible Message Waiting | <a href="#">5-277</a> |
| Station                          | ■ Audible Message Waiting | <a href="#">6-28</a>  |

### Considerations

---

- You must inform the user where to call to retrieve messages.
- Use Clear Message Waiting Indicators to turn off message-waiting indicators when the system loses synchronization between voice terminals and message-status data.
- Audible Message Waiting requires a separate software right-to-use fee.
- Audible Message Waiting may not be applicable in countries that restrict the characteristics of dial tones provided to users.

### Interactions

---

None

## Authorization Codes

---

Authorization Codes provides the means for extending control of system users' calling privileges. They extend calling-privilege control and enhance security for remote-access callers.

Authorization codes may be used to:

- Override facility restriction levels (FRLs) assigned to originating stations or trunks
- Restrict individual incoming tie trunks and remote-access trunks
- Track CDR calls for cost-allocation purposes
- Provide additional security control

### How to administer Authorization Codes

---

#### Required forms

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Authorization Code — COR Mapping  | ■ AC, COR   | <a href="#">5-54</a>  |
| Feature-Related System Parameters | <ul style="list-style-type: none"> <li>■ Authorization Code Enabled</li> <li>■ Authorization Code Length</li> <li>■ Authorization Code Cancellation</li> <li>■ Symbol</li> <li>■ Attendant Time Out Flag</li> </ul> | <a href="#">5-123</a> |
| Station                           | ■ COR   | <a href="#">6-28</a>  |
| Class of Restriction              | ■ FRL   | <a href="#">5-72</a>  |
| Route Patterns                    | <ul style="list-style-type: none"> <li>■ Trunk Group Number</li> <li>■ FRL</li> </ul>   | <a href="#">8-67</a>  |
| Remote Access                     | ■ Authorization Code Remote Access Dial Tone  | <a href="#">5-258</a> |
| Trunk Groups:                     | ■ Auth Code   | <a href="#">7-115</a> |

### Detailed description

---

When an authorization code is dialed, the FRL assigned to the extension number, attendant console, incoming trunk group, or remote access trunk group being used for the call is replaced by the FRL assigned to the authorization code. The new FRL functions the same as the one it replaces; however, the new FRL may

represent greater or lesser calling privileges than the FRL that it replaces. Access to any given facility depends on the restrictions associated with the authorization code FRL.

### Example

A supervisor is at a desk of an employee and wants to make a call that is not normally allowed by the FRL assigned to that employee's extension. The supervisor, however, can still make the call by dialing an authorization code that is assigned an FRL that is not restricted from making that type of call.

For security reasons, authorization codes range from four to seven digits. The number of digits in the codes must be a fixed length for a particular DEFINITY ECS.

Incoming trunk groups within a system may be administered to always require an authorization code. The system applies recall dial tone to a call when the user must dial an authorization code. If the user dials a correct authorization code within 10 seconds (interdigit timeout), the call completes as dialed. If the user does not dial an authorization code or dials an incorrect authorization code, the call routes to the attendant, or routes to intercept tone, depending on system administration.

Normally, DID trunks should not require authorization codes. However, it can be done and care should be taken when administering DID trunks to require an authorization code, because different type calls could terminate at different endpoints, and requiring an authorization code could be confusing to the caller.

A Cancellation of Authorization Code Request (CACR) digit may be administered. The CACR digit cancels the 10-second interval between dialing. When the CACR digit is dialed, the call immediately routes according to system administration. (Incoming trunk calls receive intercept treatment or go to the attendant.) Other calls receive intercept treatment unless the user's FRL is high enough to route the call. A CACR digit from an off-premises extension over DID/Tie trunks use DID/Tie trunk intercept treatment. Internal calls receive intercept tone.

### CAUTION:

*Do not program passwords or authorization codes onto auto dial buttons. Display telephones display the programmed buttons, providing internal abusers access to the auto dial buttons to originate unauthorized calls. If passwords or authorization codes must be programmed onto auto dial buttons, use the ~s (suppress) character to prevent displaying the codes.*

## AAR and ARS Calls

Each authorization code is assigned a COR that contains an associated FRL. Within a system, access privileges are determined by the FRL assigned to the facility where the call is originated. When an AAR/ARS call is dialed, the system allows or denies the call based on the FRL of the originating station. COR is used to restrict internal or non-AAR/ARS calls.

Authorization codes are given to individual users and provide a method of specifying the level of calling privileges for that user regardless of the originating facility. Once an authorization code is required and dialed on an AAR/ARS call, the FRL assigned to the authorization code replaces the originating FRL and controls and defines the user's privileges.

An AAR or ARS call originated by a system user or routed over an incoming tie trunk may require a dialed authorization code to continue routing.

Extreme care should be taken when administering authorization codes, so that a user does not have to dial the authorization code more than once. For example, if a user makes an AAR or ARS call and the user's FRL is not high enough to access any of the trunks in the routing pattern, the system prompts the user for an authorization code. If the FRL assigned to the authorization code is high enough to access the next trunk group in the routing pattern, the user is not prompted to dial the code again. If the call is routed through another PBX, the user may be required to dial an authorization code again. This type of situation can be avoided through careful administration.

When an authorization code is required on some, but not all, trunk groups, the system prompts for an authorization code when the originating FRL is not adequate to access the next available trunk group in the routing pattern.

## Considerations

---

- From remote locations users typically access authorization from touch-tone stations. However they can also do so from rotary dialing stations at specified authorization-code-forced locations that follow appropriate trunk administration practices. Rotary station users access attendants via LDN or remote access numbers (RAN) and can experience a 10-second timeout.
- The use of Authorization Codes does not limit other call-control methods such as Toll Restriction, Miscellaneous Trunk Restriction, and Outward Restriction.
- For security reasons, authorization codes should be assigned randomly.
- If timeout to attendant does not occur or CACR digit codes are dialed instead of authorization codes, the system assumes that invalid authorization codes were dialed and the caller is given intercept tones.
- Authorization codes impact calling privileges by:

- Changing outgoing-call FRLs when they are insufficient to access preferred routing patterns assigned by AAR/ARS. FRLs are assigned to Class of Restrictions (COR) associated with user authorization codes. No additional COR data is assigned.
- Overriding COR for remote access calls assigned to barrier codes, when required. For remote-access calls, if an authorization code is required, the user is assigned the COR of the dialed authorization code, with all connected data, such as the FRL. This COR overrides the COR assigned to any required barrier code.
- Incoming trunk calls that require authorization codes do not change user privileges.

## Interactions

---

- AAR/ARS Partitioning  
Partitioned group numbers (PGN) are assigned by COR and Authorization Codes can change CORs. Therefore, PGNs can be changed on incoming remote access calls by authorization codes. For originating calls, user CORs determine PGNs.
- Cancellation of Authorization Code Request (CACR)

| If                                  | Then                 |
|-------------------------------------|----------------------|
| CACR = 1                            | ■ Authorization ≠ 1  |
| Network = DEFG1, DEFG3 or DEF ECSR5 | ■ CACR can be #      |
| Network - S85s, DIM PBX             | ■ CACR = 1 (default) |

- COR and FRL  
Authorization codes used for AAR/ARS calls override associated FRLs. Associated CORs determine remote-access user privileges.
- Forced Entry of Account Codes and CDR  
For 94A LSU (no longer supported) and 3B2 CDRU (no longer supported) 18-word records, authorization codes are output if administered account-code lengths are fewer than six digits. For 59-character records, authorization codes are never recorded.  
  
Authorization codes are recorded after destination addresses are dialed. Invalidly-dialed authorization codes are recorded, and patterns can be traced using CDR printouts.

## Auto Start and Don't Split

---

Auto Start and Don't Split allows the attendant to initiate a call by pressing any key on the keypad without having to first press the Start button.

### How to administer Auto Start and Don't Split

---

#### Required forms

---

| Form              | Field  | Page                 |
|-------------------|--|----------------------|
| Attendant Console | ■ Feature Button Assignments<br>— dont-split | <a href="#">5-35</a> |

---

### Detailed description

---

Auto Start reduces the number of buttons that attendants must press to handle calls. If the attendant is on a call and presses any key on the keypad, the system splits the call and dials the next call. The Start button is disabled and end-to-end signaling is not allowed.

To deactivate Auto Start, press the Don't Split button. To reactivate Auto Start, and allow end-to-end signaling, press the Don't Split button again, press Cancel, or let the current call terminate. When Don't Split is active, keys pressed on the keypad are heard by the parties on the call. Use Don't Split to send touch-tones to the far end to pick up answering-machine messages.

To extend a call to another extension in Auto Start mode, dial the extension. The call is automatically put on hold. Once the called party answers, press Release.

### Considerations

---

- If an attendant enables Auto Start and dials an AAR number where the min and max in the AAR analysis table are not equal, the attendant must dial a # after the digit string or the call does not process.

### Interactions

---

- CDR — Account Code Dialing  
If the system is using Call Detail Recording Account Code Dialing, Auto Start and Don't Split is not activated.
- Visually Impaired Service  
If VIS is activated or deactivated while Don't Split is active, Don't Split deactivates.

## Automated Attendant

---

Automated Attendant uses vector commands to allow a caller to enter the extension of the party that he or she would like to reach. The call is routed by the vector to that extension.

See “Treating Digits as a Destination” in Chapter 5 of the *DEFINITY Enterprise Communications Server Call Vectoring/EAS Guide* for a detailed description of Automated Attendant and for a sample vector that can be used for this feature. The guide contains information that is critical to the effective and efficient use of Automated Attendant.

### How to administer Automated Attendant

---

#### Required forms

| Form                                  | Field  | Page                  |

| Announcements/Audio<br>Sources        | ■ Complete all fields for each extension that provides an Automated Attendant announcement | <a href="#">5-26</a>  |
| Hunt Group                            | ■ Vector   | <a href="#">5-158</a> |
| Call Vector                           | ■ Complete a form for each Automated Attendant vector                                      | <a href="#">9-207</a> |
| Station<br>(multi-appearance)         | ■ Button/Feature Button Assignments<br>- callr-info  | <a href="#">6-14</a>  |
| Attendant Console                     | ■ Feature Button Assignments<br>-callr-info  | <a href="#">5-35</a>  |

You can administer any display-equipped voice terminal or attendant console with a Caller Information CALLR-INFO button. The button displays digits collected for the last *collect digits* command.

### Considerations

---

Automated Attendant competes with several features for ports on the call classifier — detector circuit pack or equivalent.

## Interactions

---

- AUDIX

Automated Attendant gives the caller the option of leaving a message or waiting in queue for an attendant. See “Message Collection” in Chapter 5 of the *DEFINITY Enterprise Communications Server Call Vectoring/EAS Guide*.

- Authorization Codes

If authorization codes are enabled, and a *route-to* command in a prompting vector accesses AAR or ARS, if the VDN's FRL does not have the permission to use the chosen routing preference, then the system does not prompt for an authorization code and the *route-to* command fails.

- CallVisor ASAI

ASAI-provided digits can be collected by the Call Vectoring feature via the *collect* vector command as dial-ahead digits. CINFO is passed to CallVisor ASAI.

- Hold

If a call is put on hold during the processing of a *collect* command, the command restarts, beginning with the announcement prompt, when the call is taken off hold. All dialed-ahead digits are lost. Similarly, if a call to a vector is put on hold, vector processing is suspended when a *collect* command is encountered. When the call becomes active, the *collect* command resumes.

- Inbound Call Management (ICM)

You can use Automated Attendant to collect information that may later be used by an adjunct to handle a call.

- Transfer

If a call to a VDN is transferred during a *collect* command, the *collect* command restarts when the transfer is complete, and all dialed-ahead digits are lost. Similarly, if a call to a vector is transferred, vector processing is suspended when a *collect* command is encountered. When the transfer is complete, the *collect* command resumes. Attendant extended calls do suspend vector processing in the same way as transferred calls.

## Automatic Callback

---

Automatic Callback (ACB) allows internal users who placed a call to a busy or unanswered internal voice terminal to be called back automatically when the called voice terminal becomes available.

When a user activates ACB, the system monitors the called voice terminal. When the called voice terminal becomes available to receive a call, the system originates the ACB call. The originating party receives priority ringing. The calling party then lifts the handset and the called party receives the same ringing provided on the original call.

### How to administer Automatic Callback

---

#### Required forms

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Feature-Related System Parameters | ■ Automatic Callback — No Answer Timeout Interval (number of rings) | <a href="#">5-123</a> |
| Feature Access Code (FAC)         | ■ Automatic Callback Activation and Deactivation                    | <a href="#">5-113</a> |
| Station (multiappearance)         | ■ Button/Feature Button Assignments — auto-cback                    | <a href="#">6-28</a>  |
| Class of Service                  | ■ Auto Callback (0-15)  | <a href="#">5-81</a>  |

### Detailed description

---

A single-line voice terminal user activates this feature by pressing the Recall button or flashing the switchhook and then dialing the ACB access code. A single-line user can activate ACB for only one call at a time.

A multi-appearance voice terminal user can activate ACB for the number of ACB buttons assigned to the terminal. After placing a call to a voice terminal that is busy or that is not answered, the caller simply presses an idle ACB button and hangs up.

If the calling voice terminal user answers an ACB call, and for some reason the called extension cannot accept a new call, the calling user hears confirmation tone and then silence. The call is still queued.

Users cannot activate ACB for calls to:

- An attendant console group
- A voice terminal assigned Termination Restriction
- A voice terminal when using Automatic Call Distribution

- An extension with ACB already activated toward it
- A data terminal (or data module)
- A Direct Department Calling group
- A Uniform Call Distribution group
- A Terminating Extension Group
- A VDN Extension

## Considerations

- The system cancels an ACB request for any of the following reasons:
  - The called party is not available within 30 minutes.
  - The calling party does not answer the callback call within the administered interval (2–9 ringing cycles).
  - The calling party decides not to wait and presses the same ACB button a second time (multi-appearance voice terminal) or dials the ACB cancellation code (single-line voice terminal).
- ACB is administered to individual voice terminals by their COS and cannot be assigned to the attendant(s). Multi-appearance voice terminals must have an ACB button to activate the feature.
- ACB works differently depending on if the called party was busy or did not answer the call. For a busy call, ACB takes place as soon as the called party hangs up. If the called party did not answer, the voice terminal must be used for another call and then hung up before ACB is activated.

### NOTE:

If the ACB originator has all line appearances occupied when the ACB call comes in, the user will hear priority ringing once, and the ACB lamp will blink. However, if the user presses the ACB button to answer the ACB call, one of the other calls will drop.

## Interactions

- Attendant Call Waiting and Call Waiting Termination  
If a user activates ACB to or from a single-line voice terminal, Call Waiting Termination is denied.
- Attendant Intrusion  
Attendant Intrusion does not work if a user has activated ACB.
- Bridged Call Appearance  
Users cannot activate ACB from a bridged call appearance. If a user activates ACB from a primary extension number, the return-call notification rings at all bridged call appearances.

- **Busy Verification**  
If a voice terminal has activated ACB, you cannot perform Busy Verification of that terminal.
- **Call Coverage**  
ACB calls do not redirect to coverage.
- **Call Forwarding**  
If the called voice terminal has Call Forwarding activated, the calling party cannot activate ACB. However, if ACB was activated before the called voice terminal user activated Call Forwarding, the system redirects the callback call attempt toward the forwarded-to party.
- **Call Pickup**  
A group member cannot answer a callback call for another group member.
- **Class of Restriction**  
Voice terminals with origination restriction cannot activate ACB.
- **Conference and Transfer**  
A single-line voice-terminal user cannot activate conference or transfer if ACB is active.
- **DCS**  
ACB operates over a DCS network as if it were on a local switch.
- **Hold**  
A single-line voice terminal cannot receive ACB calls if the user has placed a call on hold.
- **Hot Line Service**  
Voice terminals administered for Hot Line Service cannot activate ACB.
- **Intercom - Automatic and Dial**  
Intercom calls are not eligible for ACB.
- **Internal Automatic Answer (IAA)**  
IAA does not automatically answer ACB calls.
- **Manual Originating Line Service**  
Voice terminals with Manual Originating Line Service cannot activate ACB.
- **Ringback Queuing**  
Users can press an ACB button to activate Ringback Queuing.

- Voice Terminal Display

When the system generates an ACB call, the display of the originating voice terminal displays *ACB* (or the equivalent for Administrable Language Displays).

## Automatic Circuit Assurance

---

Automatic Circuit Assurance (ACA) helps you identify possible trunk malfunctions. With ACA enabled, the system measures the holding time of each trunk call. If the measurements show calls with either extremely long or extremely short holding times, DEFINITY ECS places a referral call to an attendant or voice terminal.

The system records holding time from when a trunk is accessed to when it is released. You set short-holding-time and long-holding-time limits for each trunk group. The system then compares the recorded holding times against these limits.

### How to administer ACA

---

#### Required forms

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature-Related System Parameters | ■ Automatic Circuit Assurance (ACA) Enabled                  | <a href="#">5-123</a> |
|                                   | ■ ACA Referral Calls   |                       |
|                                   | ■ ACA Referral Destination                                   |                       |

|                                   | ■ Short Holding Threshold                                    |                       |
|                                   | ■ Long Holding Time (hours)                                  |                       |
|                                   | ■ Short Holding Time (seconds)                               |                       |
| Attendant Console                 | ■ Feature Button<br>— aca-halt                               | <a href="#">5-35</a>  |
| Station                           | ■ Feature Button<br>— aca-halt                               | <a href="#">5-35</a>  |

## Detailed description

---

You enable ACA for the entire system, and administer thresholds for individual trunk groups. You can have all trunks or only certain trunks measured.

DEFINITY ECS deals with long-holding and short-holding calls differently. For every call that is shorter than the administered short-holding time, the system increases the short-holding counter by 1. For calls over the same trunk that are within the normal range, it decreases the short-holding counter by 1. Thus, trunks that handle a normal variety of call lengths are not singled out as faulty. If the counter reaches the administered short-holding threshold, the system places a referral call.

If one long call exceeds the long-holding time, the system makes a referral call.

### The referral call

The display or voice-synthesized message that accompanies an ACA call contains the following information:

- The fact that this is an ACA call
- The trunk access code, trunk group number, and trunk group member number
- The type of referral (short or long holding time)

Once the referral call is answered, this information is displayed and remains displayed until the call is released. If the call is not answered within three minutes, the call stops. The system places the call again after one hour, and continues to place the call hourly until someone answers.

The attendant or voice-terminal user who receives the referral call can stop further calls by pressing the `aca-halt` button, if one is provided. This is a toggle button, and turns off the feature until the user presses the button again.

### The audit trail

Each time a referral call is necessary, the system also adds a record to an audit trail. Audit trail records are available on the ACA Measurements Report. Each record contains the following information:

- Time and date of referral
- Trunk group number, trunk access code, and trunk group member
- The type of referral (short or long holding time)

The audit trail contains up to 64 records. New records overwrite older ones when the buffer is full. *DEFINITY ECS System Monitoring and Reporting* contains more information on the ACA Measurements Report.

## Considerations

---

- You cannot measure personal CO lines, out-of-service trunks, or trunks undergoing maintenance testing.

## Interactions

---

- Administrable Language Displays  
You cannot administer languages for ACA messages.
- AUDIX  
Do not set the referral-call extension to a terminal that covers to AUDIX. AUDIX could potentially overload with the volume of calls, because ACA calls remain active for up to three minutes.
- Busy Verification of Terminals and Trunks  
Once you have identified a potentially defective trunk, you can use Busy Verification to check it.
- Centralized Attendant Services  
When CAS is activated, the referral-call destination must be on the local switch. The system interprets a referral destination of 0 as the local attendant, if one exists. The CAS attendant cannot activate or deactivate ACA referral calls at a branch location.
- DCS  
Referral calls may be placed across a DCS network. One switch (the primary) is administered to receive ACA referred calls from remote nodes for all switches within the network. You must administer the field ACA Remote PBX Identification with the PBX ID of the node that is designated as primary.  
If ACA referral calls are sent off the switch that generates the referral, the display and voicing information indicating the failed trunk is lost, even if the referral call is made over a DCS network.
- Internal Automatic Answer  
ACA calls are not eligible for IAA.
- Night Service  
Referral calls to the attendant are not placed if the system is in Night Service mode.
- Visually Impaired Attendant Service  
If the attendant presses the DISPLAY STATUS button and an ACA call has not been answered, then the words *Automatic Circuit Assurance* are voiced.

## 4 Basic Features

### *Automatic Circuit Assurance*

Page 4-107

If a visually-impaired attendant presses the DISPLAY STATUS button and the ACA call has been answered, then the words *Automatic Circuit Assurance* and the extension assigned to the ACA call are voiced.

If your switch contains a voice-synthesis board, ACA referral calls are accompanied by an audible message identifying the type of ACA infraction encountered. The message is "Automatic circuit assurance <long> or <short> holding time threshold has been exceeded for trunk group <#> member number <#>."

- Voice Message Retrieval

If you use Voice Message Retrieval, you can assign a nondisplay voice terminal as a referral destination.

- Wideband Switching

ACA treats wideband-trunk calls as a single-trunk call and therefore triggers a single referral call. The call information shows the lowest B-channel trunk member associated with the wideband channel.

## Automatic Incoming Call Display

Automatic Incoming Call Display allows the system to provide information about an incoming call when the called party is active on a call. The system does this by displaying incoming call information on the called party's display-equipped voice terminal.

### How to administer Automatic Incoming Call Display

You do not need to administer this feature. However, if you want the displays to be in a language other than English, (the system default language), you need to administer the language you want to use. See [“Administrable Language Displays” on page 4-20](#) for information on administering non-English displays.

### Detailed description

The system replaces any display information with the identity of the incoming call. It displays the information for 30 seconds unless:

- The called party receives another call.  
In this case, the system overwrites the current display with information about the incoming call. This is true for each new incoming call.
- The called party hangs up.  
In this case the system clears the display.
- The calling party hangs up.  
In this case the system returns to the previous display information.

The display returns to the current call information after 30 seconds unless the information is displayed on a CALLMASTER terminal. In that case, the display goes blank after 30 seconds.

If the called party is in the process of placing a call, the system does not replace the display information with incoming call information.

### Considerations

- The system displays call information only if the call terminates at the called party's voice terminal. For example, the system does not display information when it forwards a call to another extension.
- The called party's voice-terminal display must be on and in the normal mode to display call information.

## Interactions

---

- Station Type PC/PBX

The system may omit the call-appearance designation (a=, b=, c=, d=) information in order for the find capability of the Call Log in the PC/PBX Connection software to work properly.

- Trunks

When a caller makes an outgoing trunk call on a trunk group and the Trunk Group form's *Outgoing Display Option* field set to **no**:

- Incoming station calls to the caller do not replace the display while the caller is on the call.
- Incoming trunk calls to the caller do not replace the display while the caller is on the call.

The caller's dialed number stays on the display and is not replaced by the trunk group name.

- Voice Terminal Display

The Automatic Incoming Call Display feature enhances the Voice Terminal Display feature by providing automatic identification of incoming calls. The same incoming-call information can be provided by putting the display in the inspect mode. However, this is not automatic; you must reset the mode manually for each call.

## Block Collect Call

---

Block Collect Call disallows collect calls on a trunk group by trunk group basis. This feature is used only with central offices (COs) that react in this manner to a 2-second flash. COs in Brazil do so.

### How to administer Block Collect Call

---

#### Required forms

---

| Form        | Field          | Page                  |
|-------------|----------------|-----------------------|
| Trunk Group | ■ Country      |                       |
|             | ■ Flash Length |                       |
|             | — CO           | <a href="#">7-168</a> |
|             | — DID          | <a href="#">7-178</a> |
| — DIOD      |                | <a href="#">7-183</a> |

---

- Set Country to **23** and the Flash Length to **2000** on each trunk group form.

### Detailed description

---

Block Collect Call is administered by trunk group for CO, DID, and DIOD trunks.

If these two fields (Country and Flash Length) on a trunk group are set to the above values, on all incoming calls by this trunk group, the switch sends a double answer. This is a short answer followed by a flash for 2 seconds.

If a call is collect, it is blocked. The central office (CO) either returns a busy tone on analog CO trunks or signals a disconnect on analog DID or digital trunks.

If a call is not collect, a 2-way talk path is re-established after double answer.

### Interactions

---

- Automatic Call Distribution

During the double-answer interval, the agent hears clicking or silence.

Forced announcement is recommended to prevent agents from answering a call before the double-answer interval completes.

- BCMS

Calls are recorded only when they are answered by an agent or an announcement. Calls that drop are recorded as abandoned calls.

- Busy-Tone Detection

An OEM/CPE Busy-Tone Detection adjunct for analog trunks is *highly* recommended for use with this feature. It prevents connecting abandoned calls to the answering agent, and locking up trunk-to-trunk connections and repetitive announcements.
- Call Coverage

Block Collect Call does not apply to calls that cover off-net.
- Call Forward

Block Collect Call does not apply to calls that forward off-net.
- Call Vectoring

The double-answer interval applies before any vector steps are processed.
- Distributed Communications System

Block Collect Call is available only on trunks that come into a switch and are answered by a station on the same switch.
- Electronic Tandem Network

Block Collect Call is not provided over ETN trunks.
- Remote Access

Do not use Block Collect Call on remote-access trunks. They require a barrier code and are not directed toward a station.
- Voice Terminal

During the double-answer interval, the called party hears clicking or silence. The voice terminal displays the same caller information with Block Collect Call as it does without it.

## Bridged Call Appearance

Bridged Call Appearance allows single-line and multiappearance voice-terminal users to have an appearance of another user's primary extension number. The bridged call appearance can be used to originate, answer, and bridge onto calls to or from the other user's primary extension number.

### How to administer Bridged Call Appearance

#### Required forms for Single-Line Voice Terminals

## Detailed description

An appearance of a voice terminal's primary extension number at another voice terminal is called a bridged call appearance. A bridged call appearance can be used to originate, answer, or bridge onto an existing call to or from the primary terminal user's extension number.

On single-line voice terminals, Bridged Call Appearance is used by going off-hook. On multiappearance voice terminals, Bridged Call Appearance is used by going off-hook and pressing the bridged appearance button. In both cases, the user is then bridged onto the primary terminal's extension number and can handle calls on that extension number.

An incoming call rings the primary extension number's voice terminal and all voice terminals that have a bridged call appearance of the voice terminal's primary extension number. Each voice terminal is visually alerted for all bridged appearances on the voice terminal, but has the option of audible ringing.

On multiappearance voice terminals, a bridged call appearance can be assigned to any 2-lamp button. It does not require the use of a regular call appearance.

A bridged call appearance can be used just like a regular call appearance for most features. For example, Conference, Transfer, Hold, Drop, and Priority Calling can be used from a bridged appearance, just as they are used from a regular call appearance.

You can administer a voice terminal with zero call appearances of its primary extension. In this way, a voice terminal can be administered to have only bridged appearances.

## **Extension administrable buttons and lamps for multiappearance voice terminals**

You can administer the message lamp and some feature buttons to apply to a specified extension rather than the extension of the terminal they reside on.

- You can administer the message lamp to light when messages are waiting for the extension specified on the Station form. In this way, the bridged user's terminal can be set up to indicate when messages are waiting for the primary extension.
- You can administer the call forwarding all calls and call forwarding busy/don't answer buttons to activate Call Forwarding for any extension that is on the voice terminal, even if this extension is a bridged appearance. In addition, you can administer the lamp associated with the call forwarding button to track the call forwarding status of any extension. In this way, a bridged user can activate or deactivate Call Forwarding for

all primary and bridged appearances of the extension from the bridged appearance terminal, and the bridged appearance terminal shows the call forwarding status of the specified extension.

- You can administer the send all calls button to activate Send All Calls for any administered extension. The lamp associated with Send All Calls tracks the status of the administered extension. In this way, a bridged user can activate Send All Calls for the primary extension user.

## Sample applications

- A secretary making or answering calls on an executive's primary extension  
These calls can be placed on hold for later retrieval by the executive, or the executive can simply bridge onto the call. In all cases, the executive handles the call as if he or she had placed or answered the call. It is never necessary to transfer the call to the executive.
- A secretary taking care of details for an executive who is already active on a call  
A secretary can bridge onto an active call and take down information such as an address or telephone number.
- Visitor telephones  
An executive may have another voice terminal in their office that is to be used by visitors. It may be desirable that the visitor be able to bridge onto a call that is active on the executive's primary extension number. A bridged call appearance makes this possible.
- Service environments  
It may be necessary that several people be able to handle calls to a particular extension number. For example, several users may be required to answer calls to a hot line number in addition to their normal functions. Each user may also be required to bridge onto existing hot line calls. A bridged call appearance provides this capability.
- A user frequently using voice terminals in different locations  
A user may not spend all of their time in the same place. For this type of user, it is convenient to have their extension number bridged at several different voice terminals.
- Executive suite environments (multiappearance voice terminals only)  
You can administer terminals with zero call appearances of their primary extension number. When this feature is combined with extension administrable buttons and lamps, it is possible to administer several nearly identical phones for one office suite. You can then operate their voice terminal the same way regardless of which voice terminal is being used.

## Considerations for single-line voice terminals

- The number of bridged call appearances allowed varies by system. See *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference* for those numbers. A bridging user cannot have more than one bridged appearance for a particular primary terminal. However, a multiappearance bridging user can have appearances of more than one analog terminal on their terminal (a multiappearance bridging user, by use of different buttons, can bridge onto several different primary terminals).
- The number of bridged appearances allowed on a multiappearance bridging user's terminal is limited only by the number of 2-lamp buttons available on the terminal.
- If the primary single-line terminal is correctly administered, but not in service, calls can still be placed by the bridging users, and received on the bridged appearances of the terminal. The primary terminal can be out of service for several reasons, such as an unplugged terminal, a nonexistent terminal system technician busyout command, etc.
- If more than one user goes off-hook on a bridged appearance at the same time, only the user who was the first to go off-hook can dial.
- If a bridging user is not active on a call, and bridges onto the appearance of an active call, the user is bridged onto the active call. If a multiappearance bridging user is active on a call, and bridges onto the appearance of an active call, the previously selected call is dropped and the user is bridged onto the active call.
- The Privacy-Manual Exclusion feature can be activated by the bridging user only, while active on a call, to prevent accidental bridging of an active call.
- If a call terminates at a voice terminal on an extension number other than the primary extension number (for example, terminating extension group (TEG), uniform call distribution (UCD) group, call coverage answer group, or direct department calling (DDC) group extension number), a bridged call appearance is not maintained. Therefore, the primary terminal should not be made a member of such a group (even though administration of this is not prohibited).
- The Bridged Call Appearance feature should not be considered as a replacement for Call Coverage or any other similar features.
- If two parties are bridged together on an active call with a third party, and if the conference tone feature is enabled, conference tone is heard.

## Considerations for multiappearance voice terminals

---

- The number of bridged call appearances allowed at each voice terminal is limited only by the number of 2-lamp buttons available on the voice terminal. The number of appearances per primary extension varies by system. See *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference* for this information.
- Up to six parties can be off-hook and involved in a conversation on a bridged appearance of an extension.
- A bridging voice terminal should have a bridged call appearance corresponding to each call appearance of the primary extension number at the bridged voice terminal. For example, if a primary voice terminal has three call appearances, a bridging voice terminal should have three bridged call appearances of that primary extension. This allows users to refer to the individual call appearances when talking about a specific call.
- Bridged call appearances may result in the reduction of available feature buttons, thereby reducing a user's capabilities. A Call Coverage module or expansion module can be used to provide up to 20 bridged call appearances. This leaves the other 2-lamp buttons as call appearances, or with other features such as Centralized Attendant Service (CAS).
- If a call terminates at a voice terminal on an extension number other than the primary extension number (for example, TEG, UCD group, call coverage answer group, or DDC group extension number), a bridged call appearance is not maintained. Therefore, the primary terminal should not be made a member of such a group (even though administration of this is not prohibited).
- Bridged Call Appearance should not be considered a replacement for Call Coverage.
- You can administer conference tone, which, when enabled, is heard when two parties are bridged together on an active call with a third party.

## Interactions

---

- Abbreviated Dialing

A user, accessing Abbreviated Dialing while on a bridged call appearance, accesses their own Abbreviated Dialing lists. The user does not access the Abbreviated Dialing lists of the primary extension associated with the bridged call appearance.

A user cannot use an abbreviated dialing FAC after using a priority calling FAC.
- Adjunct Switch Applications Interface (ASAI)

If you are using ASAI, do not administer more than 16 bridged appearances.

- Attendant Display and Voice Terminal Display

A call from the primary extension number or from a bridged call appearance of the primary extension number is displayed as a call from the primary extension number (the call is displayed as coming from the primary extension number regardless of which appearance placed the call).

On multiappearance voice terminals, the display at a principal shows the same information for a bridged call appearance as it does for a nonbridged call. For calls to the principal's extension number, the display at a zero call appearance bridging station shows a call from the originator to the principal with no "redirection reason" character. As stations bridge onto the call, the display updates to show the number of parties in the conference.

- Automatic Call Distribution

Bridged appearances cannot be accessed via non-ACD hunt groups (although administrable).

- Automatic Callback

Automatic Callback calls cannot originate from a bridged call appearance. However, when Automatic Callback is activated from the principal user's station, the callback call rings (with priority call distinctive ringing signal) at all bridged appearances of the extension as well as at the principal user's station. Displays at all stations (principal and bridged users) show that it is a callback call.

- Call Coverage

- Single-line voice terminals

When an analog station is administered as a bridged call appearance, the terminal user cannot invoke Send All Calls for the extension of their voice terminal. The user does not have a send all calls button, and the call appearance is associated with another extension. When the user dials a feature-access code (FAC), Send All Calls is activated for the extension associated with the call appearance.

- Multiappearance voice terminals

Coverage criteria for bridged call appearances is based entirely on the criteria of the primary extension associated with bridged appearance. A call to the primary extension that requires call coverage treatment follows the coverage path of the primary extension and not the path of any of the bridged appearances. Bridged call appearances do not receive redirection notification.

A user with bridged call appearances can activate or deactivate Send All Calls for a principal's primary call appearance if they are on the bridged appearance.

The primary terminal should not be a member of a call coverage group, because calls to the primary terminal as a member of the group are not bridged.

You can administer the system so that a call can appear at a terminal as both a bridged call and a redirected call. In this way, if the bridged user is the first coverage point, the call redirects to that terminal when the coverage criteria are met.

If the principal is an analog voice terminal with a bridged call appearance on a multiappearance voice terminal, an incoming call to the analog voice terminal that goes to coverage terminates at a primary call appearance on the bridging user's voice terminal as a coverage call. If the bridging user is a zero primary call appearance voice terminal, the call cannot redirect to the bridging user since there are no primary call appearances. Therefore, the call redirects to the next available coverage point.

- Call Detail Recording

If a bridging user originates or answers a call on a bridged appearance, the extension of the bridge is recorded as the calling/called terminal. A conference or transfer by a bridging user also appears as though it was performed by the terminal user.

On multiappearance voice terminals, when a call originated from a bridged call appearance on a terminal administered for zero primary call appearance is recorded by CDR, the extension number associated with the appearance is recorded as the calling party. A conference or transfer by a bridged call appearance on a zero primary call appearances terminal also appears as though it were performed by the extension associated with the appearance.

- Call Forwarding All Calls, Call Forward Busy/Don't Answer

Call Forwarding can be activated or canceled for the primary extension number from any bridged call appearance of that number. When activated, calls to the primary extension number do not terminate at the bridged call appearances, but go to the designated forwarding destination. Bridged call appearances do not receive redirection notification of the call to the primary extension when it is forwarded unless Ringing — Abbreviated and Delayed is administered.

- Call Park

When a call is parked from a bridged call appearance, it is parked on the primary extension number.

- Call Pickup

- Single-line voice terminals

Calls to the primary terminal, alerting at bridged appearances of the primary terminal, can be picked up by member's of the bridging user's call pickup group. This causes all bridged appearances of the call to be dropped.

Calls ringing at a primary terminal can be picked up by members of the primary terminal's call pickup group. However, if the primary terminal and the bridging user's terminal are not in the same call pickup group, the bridging user cannot pick up calls to other members of the primary terminal's call pickup group.

Originating on a bridged appearance and dialing the call pickup FAC is interpreted as an attempt to pick up a call from the primary terminal's call pickup group.

A bridging user can use Call Pickup to pick up a call that is alerting at a bridged appearance, instead of selecting the bridged appearance button. This causes the call at the primary terminal and all bridged appearances of the call to be dropped.

If the bridging user has appearances of numerous single-line (primary) terminals (for example, sales, service, and warehouse), and it is not desired that the calls be answered by anyone other than the primary terminal user or the bridging users, the bridging user(s) should not be assigned to a pick up group.

— Multiappearance voice terminals

If a voice terminal receives ringing on a bridged call appearance, the incoming call can be picked up by members of that voice terminal's call pickup group. This causes all bridged call appearances to be dropped. Calls ringing at a primary terminal can be picked up by members of the terminal's call pickup group. However, if the primary terminal and the bridging user's primary terminal are not in the same call pickup group, the bridging user cannot pick up calls to other members of the primary terminal's call pickup group.

Originating on a bridged appearance and dialing the call pickup FAC is interpreted as an attempt to pick up a call from the primary terminal's call pickup group.

A bridging user can use Call Pickup to pick up a call that is alerting at a bridged appearance, instead of selecting the bridged appearance button. This causes the call to terminate on the bridging user's primary extension button, and the primary terminal and all bridged appearances of the call are dropped.

If the bridging user has appearances of numerous terminals (for example, sales, service, and warehouse), and it is not desired that the calls be answered by anyone other than the terminal user or the bridging users, the bridging users should not be assigned to a pick up group.

A terminal with zero primary call appearances can be assigned to a call pickup group.

- Call Waiting Termination (single-line voice terminals only)

Call Waiting Termination applies only to an active call on the primary terminal that has no one else bridged on. If one or more bridging users are active on a call, call waiting calls are denied whether or not the primary user is also off-hook on the call. A bridging user can bridge onto a call with the primary user if there is also a call waiting.

- Class of Restriction (multiappearance voice-terminal users only)

The COR assigned to a voice terminal's primary extension also applies to calls originated from a bridged call appearance.

- Conference — Attendant, Conference — Terminal

- Single-line voice terminals

A bridged call cannot be conferenced if more than one user is active on that call. This is because the bridging user has no access to the call after the primary terminal user places the call on soft hold, and the primary terminal user has no access to the bridging user's call appearance used for conference/transfer attempts.

If a bridging user is active on a bridged call and the primary analog terminal user attempts a conference, the attempt is ignored. The same is true if an analog bridging user attempts a conference when the primary terminal user and another bridging user is active on a call.

When the primary terminal user is active on a call, and no other bridging user is active on the call, that call can be placed on hold by the primary terminal user utilizing normal single-line conference procedures. Any attempt by a bridging user to bridge onto the call during a successful conference attempt is denied.

A bridging user, alone on a bridged call, can conference the call utilizing the normal multiappearance terminal conference procedures. Any attempt by the analog primary terminal user to bridge onto the call during a successful conference attempt is ignored. Any attempt by other bridging users is denied (standard denial response is returned to the bridged appearance).

If a conference is not allowed because of the preceding limitations, the user can accomplish a transfer by asking an internal nonbridged party in the connection to create the conference, or asking the remaining bridging users and primary user to disconnect so that the conference can be completed. At completion of the conference, the parties that left the call can reenter the call if control of the conference remains with the primary terminal. If control of the conference does not remain with the primary terminal, the bridging user must conference the primary terminal and the bridging user back into the call as required.

If the bridging user has no other available bridged appearances of the primary extension (other than the one he or she is currently on), the bridging user, after pressing the conference/transfer button, must select a call appearance to be used for the conference, before dialing the number.

— Multiappearance voice terminals

Call Waiting Termination applies only to an active call on the primary terminal that has no one else bridged on. If one or more bridging users are active on a call, Call Waiting calls are denied whether or not the primary user is also off-hook on the call. A bridging user cannot bridge onto a call with the primary user if there is also a call waiting.

Conferences can be set up on bridged appearances using the usual conference operations. Either a primary extension button or a bridged appearance button can be used to make the calls for adding to the conference.

You can administer the system to automatically select the first idle appearance if there is no idle appearance with an extension matching the extension that is conferencing the call.

When the user presses the conference button (the second time) to connect the parties together, the newly formed conference call appears on the primary or bridged appearance to which the user was connected at the time of that last conference button depression. The other appearance is disassociated from the conference call. Therefore, if the original call is on a bridged appearance, and the conference is formed on an appearance of the bridged user's own primary extension, the bridged extension becomes disassociated from the conference call and the principal user of that bridged extension can no longer bridge onto the conference.

This disassociation of the conference from the bridged extension can be avoided by setting up the conference in the opposite order. To do this, the user:

1. Presses the hold button to hold the original call on the bridged appearance
2. Selects a call appearance and calls the party to be added
3. Presses the conference or transfer button
4. Selects the held bridged appearance
5. Presses the conference button (again)

When this procedure is used, the conference is formed on the bridged appearance so that the primary user of the bridged extension can still bridge onto the conference call.

If the primary user and the bridged user are both on the call when one user transfers the call, the user performing the transfer becomes the controlling user for the participation of both users on the conference. To disassociate the appearance from the call, the controlling user must be the latter of the two users to hang up from the call. If the controlling user hangs up first, the appearance goes on soft hold when the noncontrolling party hangs up. In this case, one of two things must occur to disassociate the appearance from the call: all other parties on the call hang up, or the controlling user rejoins the call and hangs up again.

The display shows the number of other active parties in a call, including active bridged appearances.

- Consult (multiappearance voice terminals only)

Bridged call appearances of the primary extension do not ring on a consult call to the primary extension.

- Coverage Answer Group

- Single-line voice terminals

The primary (analog) terminal is not a member of a call coverage answer group, because calls to the primary terminal as a member of the group *are not bridged*.

If the primary terminal is made a member of a coverage group, coverage criteria is based entirely on the criteria of the primary terminal. This means that a call to the primary terminal that requires call coverage treatment follows the path of the primary terminal and not the path of any of the terminals with bridged appearances of the primary terminals. In this case, it is desirable to have the bridging user in the coverage path of the primary terminal. Then, when a call to the primary terminal requires coverage treatment, it follows the coverage path to the bridging user's terminal, call appearances of the call are dropped, and the call terminates at the bridging user's terminal as a coverage call.

- Multiappearance voice terminals

Bridged call appearances of a primary extension do not ring when there is a CAG call to the primary extension. Bridged call appearances cannot bridge onto the call.

- Data Privacy, Data Restriction

When Data Privacy is activated or Data Restriction is assigned to a station involved in a bridged call and the primary terminal and/or bridging user attempts to bridge onto the call, Data Privacy and Data Restriction are automatically overridden (or deactivated in the case of Data Privacy).

- Facility Busy Indication (multiappearance voice terminals only)

The call is placed to the resource from the first available bridged call appearance for zero primary call appearance voice terminals.

- Hold — Automatic

- Single-line voice terminals

A call cannot be put on hold if more than one user is active on that call.

The primary terminal user, when no other bridges are active on the call, can put the call on hold, using normal single-line hold procedures. If the primary terminal user successfully soft holds the call, the status lamp at all of the bridged appearances shows the hold indication; and then the call can be put on hard hold by dialing the hard hold FAC. The hard held call is no longer accessible to the bridging users until it is taken off hold by the primary terminal user. After the call is put on hard hold, any new call to the primary terminal is tracked by the bridged appearances.

A bridging user can place an active call on hold (if the primary terminal or any other bridges are not active on the call) by using normal multiappearance hold procedures. Any attempt to enter the held call returns it to the status of an active call that can then be accessed using bridging procedures.

If hold is not allowed because of the preceding reasons, the user can just go on-hook and then reenter the call as required, because the call remains accessible as long as the primary terminal or any bridging user is active on it.

- Multiappearance voice terminals

Any user (primary or bridged appearance) can place an active call on hold. If only one user is active on a call and places that call on hold, the indicator lamp at both the principal's appearance button and the bridged party's appearance button shows that the call is on hold. If more than one user is bridged onto the active call, and one of the users activates Hold, the activator receives "hold" indication for the call and status lamp of all other bridged users remains active.

- Hotline Service (single-line voice terminals)

If a single-line voice terminal is administered for Hotline Service, bridged appearances of that voice terminal's extension also places a hot line call automatically when a user goes off-hook on that bridged appearance.

- Hunt Group (DDC or UCD)

Bridged call appearances cannot be used in conjunction with DDC or UCD hunt groups.

Although you can assign a bridged extension to a hunt group, such assignment is not recommended because DDC/UCD calls do not terminate at any bridged appearances of that extension on other stations.

## 4 Basic Features

### *Bridged Call Appearance*

Page 4-124

- Intercom — Automatic and Intercom — Dial (multiappearance voice terminals only)

Bridged appearances of a primary extension number are not rung for intercom calls. Furthermore, if a station has no primary call appearances it can never be rung for an intercom call. Therefore, if a secretary is screening all calls for the principal, and is indicating who is calling via intercom, the principal must have a call appearance on which to receive and send intercom calls.

- Internal Automatic Answer

Calls terminating to a bridged appearance of an IAA-eligible station are not eligible for IAA.

- Last Number Dialed

Activation of the LND feature causes the last number dialed from the activating voice terminal to be redialed, regardless of the extension number used (primary or bridged call appearance).

- Leave Word Calling

A LWC message left by a user on a bridged call appearance leaves a message for the called party to call the primary extension number assigned to the bridged call appearance.

When a user calls a primary extension, and activates LWC, the message is left for the primary extension, even if the call was answered at a bridged call appearance.

LWC messages left by the primary user can be canceled by a bridged appearance user (for example, a secretary can cancel a LWC message left by a boss).

- Personal Central Office Line

- Single-line voice terminals

A single-line primary terminal cannot be a member of a PCOL group.

- Multiappearance voice terminals

If a user is active on his or her primary extension number on a PCOL call, bridged call appearances of that extension number cannot be used to bridge onto the call. The call can only be bridged onto the call if another voice terminal is a member of the same PCOL group and has a PCOL button.

- Preference

Ringling Line Preference selects an alerting bridged appearance; Idle Line Preference does not.

- Priority Calling

The primary terminal user or the bridging user can make a priority call. If a priority call is made to an idle terminal, the primary terminal and all bridging users are alerted by priority alerting.

A user cannot use an abbreviated dialing FAC after using a priority calling FAC.

- Privacy-Manual Exclusion

Exclusion prevents any other user from bridging onto the call. Activation of exclusion by any user (primary or bridged appearance) before placing a call, prevents any other user from bridging onto the call. Activation of exclusion by any user active on a call, while the primary user and/or any other bridging users are active on the call, drops all other users from the call (including the primary user), leaving only the activator and the calling/called party on the call.

- Redirection Notification (multiappearance voice terminals only)

Redirection Notification is not provided at stations with a bridged appearance of a primary extension number unless Ringing — Abbreviated and Delayed is administered to give notification.

- Ringback Queuing

Ringback Queuing is not provided on calls originated from a bridged call appearance. However, after the principal user of the bridged extension has activated Ringback Queuing, the resulting callback call alerts at bridged appearances as well as at the principal user's station. The call can be answered from the primary user's station or from any bridged appearance.

- Ringer Cutoff (multiappearance voice terminals only)

Ringer Cutoff prevents any nonpriority (or nonintercom) incoming call from ringing at that station. This is independent of whether the call is to the station's primary extension or to any of the bridged appearance's' extensions.

- Ringing — Abbreviated and Delayed

See Ringing — Abbreviated and Delayed, for other bridged appearance alerting options.

- Service Observing

The terminal user or bridging user can bridge onto a service observed call at any time. If the terminal is being service observed and an incoming call is answered by the bridging user, the call is not observed unless or until the terminal user bridges onto the call. Conversely, if the bridging user is being service observed and an incoming call is answered by the terminal user, the call is not observed unless or until the bridging user bridges onto the call.

If the bridging user activates Service Observing using a bridged appearance, Service Observing is activated for the bridging user.

- Terminating Extension Group

TEG calls to the primary extension do not ring at the associated bridged appearances. TEG calls cannot be answered or bridged onto from a bridged appearance of the TEG member's primary extension. The primary terminal should not be assigned to a TEG.

- Transfer

- Single-line voice terminals

A call cannot be transferred by an analog station if more than one user is active on that call.

The primary terminal user, when no other bridges are active on the call, can transfer the call using normal single-line transfer procedures. Any attempt by a bridging user to bridge onto this call during a successful transfer attempt is denied (a standard denial response is returned to the bridged appearance).

An analog bridging user, alone on a bridged call, can transfer the call, using normal transfer procedures. Any attempt by the primary terminal user to bridge onto this call during a successful transfer attempt is ignored; and any attempt to bridge on by a bridging user is denied.

If the bridging user has no other available bridged appearances of the primary extension (other than the one he or she is currently on), the bridging user, after pressing the conference/transfer button, must select a call appearance to be used for the transfer, before dialing the number.

- Multiappearance voice terminals

If the bridging user has at least one available bridged appearance of the primary extension (other than the one he or she is currently on), the system automatically selects a bridged call appearance for the transfer when the conference/transfer button is pressed.

You can administer the system to automatically select the first idle appearance if there is no idle appearance with an extension matching the extension that is transferring the call.

If the primary user and the bridged user are both on the call when one user transfers the call, the user performing the transfer becomes the controlling user for the participation of both users on the conference. The controlling user is immediately dropped from the call. When the noncontrolling user hangs up, the appearance goes on soft hold. In this case, one of two things must occur to disassociate the appearance from the call: all other parties on the call hang up, or the controlling user rejoins the call and hangs up again.

## 4 Basic Features

### *Bridged Call Appearance*

Page 4-127

- Videophone 2500 (single-line voice terminals)

A user may not use an analog bridge to a Videophone 2500 principal that is on a video call.

- Voice Message Retrieval

A voice message to the primary extension can be retrieved on a bridged appearance by the bridged appearance user. If a security code is required to retrieve the message, the bridging user must use the security code of the primary terminal.

- Voice Paging

The use of Voice Paging automatically invokes exclusion. Therefore, interactions for this feature are the same as for Privacy-Manual Exclusion.

## Bulletin Board

---

The bulletin board is a place on the switch where you can post information and receive messages from other switch administrators, including Lucent Technologies personnel. Anyone with appropriate permissions can use the bulletin board for everyday messages. In addition, Lucent Technologies personnel can leave high-priority messages, which are displayed on the first 10 lines of the bulletin board.

This feature is not intended as a substitute for existing escalation procedures, but rather as an aid to your existing procedures.

### How to administer Bulletin Board

---

#### Required forms

---

| Form                          | Field  | Page                 |
|-------------------------------|--|----------------------|
| Command Permission Categories | <ul style="list-style-type: none"><li>■ Display Admin and Maint Data</li><li>■ Administer Features</li></ul> | <a href="#">2-12</a> |
| Bulletin-Board                | <ul style="list-style-type: none"><li>■ All</li></ul>  | <a href="#">5-56</a> |

### Detailed description

---

Whenever you log in to the system, the system alerts you to any messages on the bulletin board and the date of the last-entered message. In addition, if a Lucent Technologies employee enters a high-priority message while you are logged in, you receive notification the next time you enter a command. This message disappears after you enter any command, and recurs at login until the high-priority messages are taken out.

The bulletin board provides three pages of message space. You can write on any available line other than the high-priority lines.

It is your responsibility to maintain the bulletin board. If the bulletin board is at 80% or more capacity, an additional message appears at login indicating how full the bulletin board is (for example, 86%). If the bulletin board is full, any new messages overwrite old messages.

## **Considerations**

---

- Only users with init or inads logins can add or edit high-priority messages.
- Only one user can change a message at a time.
- The bulletin board does not lose information during a system reset at level 1 or level 2. If you save translations, the information can be restored if a system reset occurs at levels 3, 4, or 5.

## **Interactions**

---

None

## Busy Verification of Terminals and Trunks

---

Busy Verification of Terminals and Trunks (Verify) allows attendants and specified multiappearance voice-terminal users to make test calls to trunks, voice terminals, and hunt DDC and UCD groups. Attendants and multiappearance voice-terminal users can distinguish between a voice terminal that is truly busy and one that only appears busy because of some trouble condition. They can also use this feature to quickly identify faulty trunks.

### How to administer Busy Verification of Terminals and Trunks

---

#### Required forms

| Form                      | Field                               | Page                 |
|---------------------------|-------------------------------------|----------------------|
| Attendant Console         | ■ Feature Button Assignments        | <a href="#">5-35</a> |
|                           | — verify<br>— Display Language      |                      |
| Station (multiappearance) | ■ Button/Feature Button Assignments | <a href="#">6-14</a> |
|                           | — verify<br>— Display Language      |                      |

#### Detailed description

---

An attendant or multiappearance voice-terminal user can activate Busy Verify by pressing the Verify button. If they want to verify a voice terminal or hunt group, they enter an extension number. If they want to verify a trunk, they dial a trunk-access code, followed by the 2- or 3-digit number of the trunk-group member to be verified. If the trunk-group member number is less than 10, the system requires a leading zero (01 or 001 rather than 1).

#### NOTE:

For Release 5vssi/csi and later, the member number is a 2-digit number; for Release 5r and later, the member number is a 3-digit number.

After an attendant or multiappearance voice-terminal user has activated Busy Verification of Terminals and Trunks, the system checks the validity of the extension or trunk-access code and member number. If the number is not a voice-terminal extension, DDC/UCD group-extension, ACD split number, or trunk access code with a valid member number, the system denies Verify and returns intercept tone.

When you use Verify to check a valid voice-terminal extension (one that is in the dial plan and assigned to a station), the system initiates a priority call to that extension. [Table 4-35](#) describes the process.

**Table 4-35. Verification of a Voice Terminal**

| Terminal Status   | System Response   | Result   |
|---|---|--|
| Idle  | <ul style="list-style-type: none"> <li>■ Generates priority ringing at the voice terminal</li> <li>■ Processes the call as a normal station-originated or attendant-originated call</li> </ul>  | <ul style="list-style-type: none"> <li>■ Verification is complete.</li> <li>■ Anyone can place a call to the voice terminal.</li> </ul>                        |
| Active on a call and has an idle call appearance                                  | <ul style="list-style-type: none"> <li>■ Generates priority ringing at the first idle appearance</li> <li>■ Processes the call as a normal attendant-originated call</li> </ul>   | <ul style="list-style-type: none"> <li>■ Verification is complete.</li> <li>■ Anyone can place a call to the voice-terminal extension.</li> </ul>              |
| Active on a call and has no idle call appearances or has only one line appearance | <ul style="list-style-type: none"> <li>■ Bridges the attendant onto the call</li> <li>■ Generates a warning tone to all active parties and repeats the tone every 15 seconds while the attendant remains bridged onto the call</li> </ul> | <ul style="list-style-type: none"> <li>■ Verification is complete.</li> <li>■ The attendant can determine if the voice terminal is actually in use.</li> </ul> |
| Out of service  | <ul style="list-style-type: none"> <li>■ Generates reorder tone</li> </ul>  | <ul style="list-style-type: none"> <li>■ Verification is denied.</li> </ul>  |

When you use Verify to check a valid ACD split, UCD group, or DDC group, the system initiates a priority call to that group. (Valid in this case means the split or group is translated and at least one member is logged in.) [Table 4-36](#) describes the process.

**Table 4-36. Verification of an ACD Split, UCD Group, or DDC Group**

| Split or Group Member Status     | System Response   | Result   |
|----------------------------------|---|--|
| Available for an incoming call   | <ul style="list-style-type: none"> <li>■ Generates priority ringing at the member's voice terminal</li> <li>■ Processes the call as a normal attendant-originated call</li> </ul> | <ul style="list-style-type: none"> <li>■ Verification is complete.</li> <li>■ Anyone can place a call to the member's voice terminal.</li> </ul> |
| All activated Make Busy          | <ul style="list-style-type: none"> <li>■ Generates reorder tone</li> </ul>  | <ul style="list-style-type: none"> <li>■ Verification is denied.</li> </ul>  |
| Not available for incoming calls | <ul style="list-style-type: none"> <li>■ The system does not queue the call even if a queue is available.</li> <li>■ Generates reorder tone</li> </ul>                            | <ul style="list-style-type: none"> <li>■ Verification is denied.</li> </ul>  |

When you use Verify to check a valid trunk, the system checks the status of that trunk. (Valid in this case means the trunk is translated with members and is not in an out-of-service state.) [Table 4-37](#) describes the process.

**Table 4-37. Verification of a Trunk**

| Trunk Status                           | System Response   | Result   |
|--|---|--|
| The trunk is idle and incoming.        | <ul style="list-style-type: none"> <li>■ The system generates confirmation tone.</li> </ul>   | <ul style="list-style-type: none"> <li>■ Verification is complete.</li> <li>■ Anyone can use the trunk.</li> </ul> |
| The trunk is idle and outgoing.        | <ul style="list-style-type: none"> <li>■ The system generates dial tone.</li> </ul>   | <ul style="list-style-type: none"> <li>■ Verification is complete.</li> <li>■ Anyone can use the trunk.</li> </ul> |
| The trunk is busy with an active call. | <ul style="list-style-type: none"> <li>■ The system bridges the Verify originator onto the call.</li> <li>■ The system generates a warning tone to all active parties and repeats the tone every 15 seconds while the Verify originator remains bridged onto the call.</li> </ul> | <ul style="list-style-type: none"> <li>■ Verification is complete.</li> <li>■ The trunk is in use.</li> </ul>      |
| The trunk is out of service.           | <ul style="list-style-type: none"> <li>■ The system generates reorder tone.</li> </ul>  | <ul style="list-style-type: none"> <li>■ Verification is denied.</li> </ul>  |

## Considerations

---

- A busy verification cannot be made to an analog extension that is waiting to be answered at another extension. A call must be answered before it can be verified.
- If your country requires a tone other than 440 Hz, use the Intrusion feature rather than Verify to verify voice terminals.
- The system does not provide bridging when you verify UCD and DDC groups or RLTs.
- You cannot make outgoing test calls on DID trunks.
- You can verify an extension that is administered without hardware. In this case, the system generates reorder tone.
- If the system denies Verify for any reason other than those identified in [Table 4-35](#), [Table 4-36](#), or [Table 4-37](#), the system generates intercept tone or reorder tone.
- The system denies Verify for vector directory numbers.

## Interactions

---

- Automatic Callback

Once the called party in an Automatic Callback call hangs up, neither extension can be busy-verified until both the calling and called parties are connected or the callback attempt is canceled (by the activating party or by time-out of the callback interval).
- Call Coverage

Since the busy-verification call to an extension is originated as a priority call, the call does not go to coverage.
- Call Forwarding

Busy verification made to an extension with call forwarding activated, does not busy verify the forwarded-to extension. Only the called extension is busy verified.
- Call Waiting Termination

You cannot verify an extension that called an active station and is receiving call-waiting ringback tone unless the extension has an idle call appearance.
- Conference — Attendant and Terminal

The system denies busy verification of any extension involved in a conference call of more than five people.

## 4 Basic Features

### *Busy Verification of Terminals and Trunks*

Page 4-134

parties that does not have an available call appearance. However, the system does allow a busy verification of any extension involved in a conference call of 5 or fewer parties. The system also denies busy verification of a trunk on a 6-party call.

- Data Privacy

Busy verification is denied if it would cause a bridging attempt on a voice terminal that has activated Data Privacy.

- Data Restriction

The system denies Verify if Data Restriction is active on a call, and a busy verification bridging attempt is made on that call.

- Hold

Busy verification of a multiappearance voice terminal is denied if all call appearances have calls on hold.

- Individual Attendant Access

An attendant cannot make a busy verification of another individual attendant console or of the attendant group.

- Loudspeaker Paging Access

The system denies busy verification if the voice terminal or trunk to be verified is connected to paging equipment.

- Transfer

Once the originator of busy verification has bridged onto a call, any attempt to transfer the call is denied until the originator drops from the call.

- Voice Terminal Origination Restriction

A voice terminal that is origination restricted can be assigned a Busy Verify button. However, the button cannot be used.

- Voice Terminal Termination Restriction

The system denies busy verification of voice terminals that are termination restricted.

## Button View

---

Button View allows users to view, on the terminal's display, the contents of any feature button. After the user presses the btn-view feature button or the BtnVu softkey, and a specific feature button, they see the feature name and any auxiliary data. These displays are helpful for users who want to see what is on their administered feature buttons. The terminal stays in the Button View mode to allow the user to view multiple features until:

- The user presses the Exit button.
- Five seconds expires since the last feature button was pressed.

This feature works on any 6400-, 7400-, or 8400-series voice terminal that has at least a 24-character display. Button View is an enhancement to the existing "View" softkey or "stored-num" feature button functionality, which only works on abbreviated dialing and autodial buttons and does not display feature names.

See *6400-Series Single-Line Telephone User's Guide (555-230-738)* and *6400-Series Multi-Line Telephone User's Guide (555-230-739)* for more information about user interactions.

### How to administer Button View

---

For new terminals and stations, use the **add** command to add the station and to administer a btn-view feature button for this feature. For systems upgrading, the Button View functionality is a default softkey for 6400-series display sets.

There can only be one Button View button assigned to each terminal; however, there is no limit on the number of Button View buttons per system, allowing for memory constraints.

### To administer user-defined language for displayed messages

Use the Change Display-Messages View-Button form to administer user-defined language. If the displayed language is set to "user-defined" for any user in the system, change the translation for each "user-defined" message to the language that the user requests.

1. Use the **change display-messages view-button** command to access the 8-page Change Display-Messages View-Button form.
2. Change the translation for each "user-defined" message to the language that the user requests.

### Interactions

---

None

## Call Charge Information

---

DEFINITY ECS provides two ways to know the approximate charge for calls made on outgoing trunks:

- Advice of Charge — for ISDN trunks  
Advice of Charge (AOC) collects charge information from the public network for each outgoing call. Charge advice is a number representing the cost of a call; it is recorded as either a charging or currency unit.
- Periodic Pulse Metering — for non-ISDN trunks  
Periodic Pulse Metering (PPM) accumulates pulses transmitted from the public network at periodic intervals during an outgoing trunk call. At the end of the call, the number of pulses collected is the basis for determining charges.

Call-charge information helps you to account for the cost of outgoing calls without waiting for the next bill from your network provider. This is especially important in countries where telephone bills are not itemized. You can also use this information to let employees know the cost of their phone calls, and so encourage them to help manage the company's telecommunications expenses. Note, however, that you cannot necessarily use this information to dispute telephone bills with the network provider.

You need to request either AOC or PPM service from your network provider. In some areas, your choice may be limited. Your Lucent Technologies representative can help you determine the type of service you need.

### NOTE:

This feature is not offered by the public network in some countries, including the US.

## Charge Display and CDR

DEFINITY ECS provides two ways for you to view call-charge information: on a voice-terminal display or as part of the Call Detail Recording (CDR) report.

From a voice-terminal display, you can see the cost of an outgoing call, both while the call is in progress and at the end of the call. If you want end users to control when they view this information, you can assign a display button that they can press to see the current call charges. If you want call charges to display automatically whenever a user places an outgoing call, you can set `Automatic Charge Display` to `y` on the user's Class of Restriction (COR) form.

## How to administer AOC (ISDN networks)

### Required forms

| Form                 | Field                            | Page                  |
|----------------------|----------------------------------|-----------------------|
| ISDN-PRI Trunk Group | ■ Charge Advice                  | <a href="#">7-219</a> |
|                      | ■ Service Type                   |                       |
|                      | ■ Supplementary Service Protocol |                       |
|                      | ■ CDR Reports                    |                       |

- The `Charge Advice` field must contain one of the following values.
  - `Automatic` — Use this only if your public network sends AOC information automatically.
  - `End-on-request` — Use this if DEFINITY ECS must request charge information with each call, and you want to receive only the final call charge.
  - `During-on-request` — Use this if DEFINITY ECS must request charge information with each call, and you want charges to display during and at the end of a call.
- In the `Service Type` field, enter **public-ntwrk**.

## How to administer PPM (non-ISDN networks)

### Required forms

| Form                                 | Field                                     | Page                  |
|--------------------------------------|---|-----------------------|
| Any of the Trunk Groups listed below | ■ Direction                               | <a href="#">7-115</a> |
|                                      | ■ CDR Reports                             |                       |
|                                      | ■ Analog PPM                              |                       |
|                                      | ■ Frequency                               |                       |
|                                      | ■ Outgoing Glare Guard timer              |                       |
| — CO                                 |   | <a href="#">7-168</a> |
| — DIOD                               |   | <a href="#">7-183</a> |
| — FX                                 |   | <a href="#">7-193</a> |
| — PCOL                               |   | <a href="#">7-246</a> |
| — WATS                               |   | <a href="#">7-268</a> |
| — DS1 Circuit Pack form              |   | <a href="#">7-79</a>  |
| — DS1 Circuit Pack form              | ■ Received Digital Metering Pulse Minimum | <a href="#">7-79</a>  |
|                                      | ■ Received Digital Metering Pulse Maximum |                       |
|                                      | ■ Received Digital Metering Pulse Value   |                       |

- Direction must be either **two-way** or **outgoing**.
- If you administer a PCOL trunk, set the `CDR Reports` field to **y**.
- PPM transmissions can occur up to five seconds after the call is dropped. In the `Outgoing Glare Guard Timer` field, enter a value large enough to account for this.

## How to administer for CDR reports

### Required forms

| Form                             | Field         | Page                  |
|----------------------------------|---------------|-----------------------|
| ISDN-PRI Trunk Group<br>(page 1) | ■ CDR Reports | <a href="#">7-219</a> |
| CDR System Parameters            | ■ All         | <a href="#">5-63</a>  |

- Primary (or Secondary) Output Format field must be one of the following types.
  - Customized — You must also include either the ISDN-CC or PPM fields in your record design. If you use both types of call-charge information, you need both fields.
  - Expanded (Enhanced 24-word standard ASCII)
  - Int-direct
  - Int-ISDN (International ISDN expanded)
  - Int-process
  - Unformatted (Enhanced 24-word standard ASCII)
- If you want call charges to restart at 0 for calls that are forwarded or transferred, administer Outg Trk Call Splitting.

## How to administer for call charge display

### Required forms

| Form                                 | Field                             | Page                  |

| Language Translations                | ■ Call Charge                     | <a href="#">5-193</a> |

## Instructions

### Trunk Group form

The following fields are optional. If you want call charges to appear as currency, complete these fields as indicated.

- In the `Charge Conversion` field, enter the value of a charge unit in terms of currency. DEFINITY ECS multiplies the number of charge units by the value of this field, and displays this as a currency amount. Valid values are **1–64,500**. Default is **1**.
- In the `Decimal Point` field, enter **comma**, **period**, or **none**. Entering comma or period in this field divides the charge value by 100. Default is **none**.
- In the `Currency Symbol` field, enter the symbol you want to appear in front of the charge amount. Valid values are any characters, to a maximum of 3, that you can enter from your keyboard. Default is blank.
- In the `Charge Type` field, enter a text string to describe the charges. This field appears on a user's voice-terminal display. Default is **units**.

### Feature-Related System Parameters form

- If the duration of a call is less than the Charge Display Update Frequency, the display will not automatically show charge information. To see charge information for a call, the user must have a disp-chrg button and must press the button before the call drops.

## Station form

- In an available `Display Button Or Feature Button` field, enter **disp-chrg** to give this user the ability to control the charge display. You must administer a disp-charge button for attendant consoles to display charges.

## Detailed description

The availability of AOC and PPM varies from one country to the next.

- In some countries, the public network sends call-charge information only at the end of a call. In others, the public network sends information during a call as well.
- In some countries, AOC information is received automatically for each call. In others, the system must request AOC information for each call.

## CDR Output

The `ISDN Call Charge` or `PPM` field contains the last cumulative charge received from the network. If `Call Splitting` or `Attendant Call Recording` is enabled, and a call has been transferred for the first time, the `ISDN Call Charge` field contains the cumulative charge most recently received from the network.

For all subsequent transfers, the `ISDN Call Charge` field contains the difference between the cumulative charge most recently received and the value generated in the previous CDR record for the same call.

A zero appears in the `Call Charge` field when: no AOC information is received; a value of zero is the last charge information received; or the outgoing trunk group is not administered for AOC or PPM.

## Considerations

### Attendant consoles

Automatic Charge Display Mode does not apply to attendant consoles. The attendant must always press a button to enter display mode.

### Performance impact

Call Charge Information can impact system performance in several ways. The information coming in over ISDN trunks takes up bandwidth, and reduces the maximum amount of traffic the ISDN D-channel can handle. This is especially true in countries such as Germany and France, where the network sends charging information updates as often as every 3 to 10 seconds for each active international call.

The number of sets that display charge information and the frequency of updates also affect performance. Normally, the update frequency should match the average rate at which call charge updates are received from the public network.

 **CAUTION:**

*Updating displays too frequently can cause unnecessary system performance degradation. If performance slows to an unacceptable rate, you may need to lengthen the amount of time between updates.*

## Button operations

If you administer a button for charge display, the display-set user can press the disp-chrg button at any time during the call to see the current charges. If your public network sends charge information only at the end of a call, display-set users must have this button and press it just before they hang up. After the call drops, the charge will appear.

## Other display functions

If a user invokes the elapsed-timer display, the timer may overwrite part of the charge display. If the user has a local directory (Dir button), and presses this button while a call is in charge display mode, the call-charge information will overwrite the directory any time an update comes in. To avoid this, the user must press Exit or Normal.

## Interactions

---

- **Attendant Features**

Attendant consoles cannot have automatic charge display. If you want the attendant to see call charges, you must assign a disp-chrg button to the attendant console. If the attendant moves to transfer an outgoing call, the display returns to normal mode. If the transfer does not complete, or the call remains at the attendant station for whatever reason, the attendant must press the disp-chrg button again to view call charges.

- **Automatic Incoming Call Display**

When a call alerts on another line appearance, the display returns to normal mode for a short time to show the identity of the caller. The user must press disp-chrg again to view call charges, or if automatic charge display is enabled, must wait for the Charge Update Frequency Timer to expire.

- **Bridged Appearance**

If a user makes a call using a bridged appearance, the call charges display on the voice terminal from which the call is made. If that voice terminal has Automatic Charge Display as part of its COR, the charges will

appear automatically. The actual charge for the call appears on the CDR report as if the call had been made from the principal's extension, not the bridged appearance.

- Call Coverage or Forwarding — Off Net

Call charges for a call to a station whose calls are redirected over a public-network trunk are charged to the called station, not the calling station. However, if the call is placed from an internal station that has charge display capability, the caller will see the charges for the redirected call.

- Call Park

When a user parks a call, the display mode returns to Normal. If a user retrieves a parked, outgoing call from another display station, the display on that set shows the current call charges if the user presses a disp-chnrg button, or if the user's COR allows Automatic Charge Display. If call splitting is enabled, the display shows the charges accumulated since the user unparked the call.

- Call Transfer

For Advice of Charge, if a transferred call is routed over a public-network ISDN-PRI trunk group, AOC administration for the outgoing trunk group controls whether AOC information is requested or recorded for the call. If two or more outgoing trunks are connected together via trunk-to-trunk transfer, the DEFINITY ECS may receive AOC information from the network for each outgoing trunk involved in the call.

- CDR Adjuncts

DEFINITY ECS does not tandem AOC information through a private network to other switches. Therefore, the CDR adjunct that records AOC information must receive its input from DEFINITY ECS directly connected to the public network.

- CDR Call Splitting

If you use CDR Call Splitting for outgoing trunks, each time a call is transferred, the system generates a separate record. Attendant Call Recording, a form of Call Splitting, generates a CDR record when an attendant drops from a call. Incoming Trunk Call Splitting has no effect on charge information.

If you rely on Call Splitting or Attendant Call Recording, you should request call charge information during the call. However, for AOC, this increases message activity on the signaling channel and reduces Busy Hour Call Capacity of the DEFINITY System.

In some countries, or with specific protocols, AOC information during a call is not available. In this case, you can use the Elapsed Time in the CDR records to allocate the charges among the parties on the call.

You must use CDR Call Splitting if you want the charge display to restart at 0 when a call is transferred.

- Centralized Attendant Services

In any configuration where a branch system has no direct connection to the public network, the private network does not pass call-charge information to these branches.
- Conference

If a user adds a third party to a call in charge-display mode, the display returns to normal. Call charges will not appear as long as there are more than two parties on the call.
- Distributed Communications System (DCS)

In any configuration where a branch system has no direct connection to the public network, the private network does not pass call-charge information to these branches.
- Electronic Tandem Network (ETN)

In any configuration where a branch system has no direct connection to the public network, the private network does not pass call-charge information to these branches.
- Enhanced Voice Terminal Display

If you have Enhanced Voice Terminal Display enabled, you can use the expanded character set to enter translations for the `Charge Type` and `Call Charge` fields.
- Hold

If a user places a call on hold, the display returns to normal mode. The user must press `disp-chrg` again to view call charges, or if automatic charge display is enabled, must wait for the `Charge Update Frequency Timer` to expire.
- Last Number Dialed

Users can view the dialed number while active on a call by pressing the `stored-numb` button, then the `last-numb` button. To view call charges again, the user must then press the `disp-chrg` button, or (if `Automatic Charge Display` is part of the user's `COR`) the `Normal` button.
- QSIG

In any configuration where a branch system has no direct connection to the public network, the private network does not pass call charge information to these branches.
- Software updates — call preserving

In the event of a call-preserving software update, call charge displays for any active calls will stop, and no final charge information will be available. The CDR report will *not* contain records for calls active during a software upgrade.
- System Resets

If you perform a warm reset while calls are active with charge display, the charge display will freeze. To resume call charge updates, users must press the Normal button.

## Call Coverage

---

Call Coverage provides automatic redirection of calls to alternate answering positions in a Call Coverage path. Call Coverage allows you to:

- Establish coverage paths with up to 6 alternate answering positions
- Establish redirection criteria that govern when a call redirects
- Redirect calls to a local switch location
- Redirect calls to a location on another switch in a DCS network (see [“Distributed Communications System” on page 12-11](#) for more information)
- Redirect calls to a remote location
- Redirect calls based on time-of-day
- Allow users to change back and forth between two coverage choices (either specific lead coverage paths or time-of-day tables). Users may make these changes either an on- or off-site location

### How to administer Call Coverage

---

1. Not for Remote Call Coverage

**Detailed description**

When a call meets the redirection criteria of the principal, the call attempts to route to one of up to 6 points in the coverage path. If no coverage points are available, the call may revert to the called principal or group. If any point in the path is available, the call either rings the individual voice terminal or member of a

group specified for that point or queues on the group. Once a call is ringing or queued at any point in a coverage path, the call never reverts to the called principal or group, or to the previous point. A call remains at a coverage point for the Coverage Subsequent Redirection interval. At the end of this interval, the call attempts to route to any remaining points in the coverage path. If no other point is available to accept the call, the call remains queued or continues ringing the current coverage point.

## Coverage Path

A Call Coverage path is a list of up to six alternate answering positions (covering users/points) that are accessed, in sequence, when the called party or group is not available to answer the call.

You can assign any of the following entities a coverage path so they are eligible to have calls redirected to coverage:

- ACD split
- Agent LoginID
- PCOL group
- TEG
- Hunt group
- Voice terminal (on-net or off-net)

You establish the coverage paths and set the redirection criteria. If a coverage path is not assigned to a particular facility, calls are not redirected from that facility, unless another feature is assigned. A coverage path can include any of the following:

- Announcement
- Attendant group
- AUDIX
- Coverage answer group
- Hunt group
- Public network number (off-net)
- VDN
- Voice terminal (on-net or off-net)

DEFINITY ECS allows for multiple coverage paths. However, for any particular call only one coverage path is used. The “lead” coverage path is the first coverage path in a chain that is considered when a call redirects to coverage. The chain is defined in the `Next Path Name` field on the Coverage Path form.

When a call redirects to coverage, the lead coverage path at that time is checked to determine whether its coverage redirection criteria match the call status. If there is a match the lead coverage path is used. If the lead path does not match, the system moves down the path chain until it finds a coverage path with redirection criteria that matches the call status. If the chain is exhausted before the system finds a match, the call does not redirect to coverage. Once a coverage path is selected, it is used exclusively through the duration of the call.

You can assign lead coverage paths directly in the *Coverage Path 1* or *Coverage Path 2* fields on the appropriate forms. For example, to assign a lead path for a TEG, set the *Coverage Path* fields on the Terminating Extension Group form. You can also assign the lead paths indirectly by assigning a Time-of-Day Coverage Table to the *Coverage Path 1* and *Coverage Path 2* fields. Then, the system selects the lead path according to the time of day.

## Call redirection criteria

Redirection criteria determine the conditions under which a call redirects from the principal (called) extension to the first position in the coverage path. The criteria and conditions that apply are as follows:

- Active

Redirects call-to-call coverage immediately when the principal is active on at least one call appearance. For a voice terminal with only one appearance or a single-line extension, assign the Busy criterion (discussed below) instead of the Active criterion.

- Busy

Redirects calls to coverage when all available call appearances at the principal extension are in use. For multiappearance voice terminals, one call appearance can be reserved for outgoing calls or incoming priority calls (discussed later). The remaining assigned call appearances are available for other incoming calls. An incoming call (other than a priority call) redirects to coverage only when all of these unreserved call appearances are in use. If at least one unreserved call appearance is idle at the principal extension, the call remains at that idle appearance.

A Terminating Extension Group (TEG) is considered busy if any voice terminal in the group is active on a call.

Each voice terminal in a UCD or DDC group must be active on at least one call appearance for the call to redirect to coverage. If any voice terminal in the group is idle the call directs to that voice terminal. If no voice terminal is available, the call can queue if queuing is provided. If queuing is not provided, then the call routes to coverage. If the queue is full or all agents are in an auxiliary state, the group is considered busy and the call routes to coverage. Queued calls remain in queue for the Don't Answer Interval.

A call will not cover to a hunt group if no agents are logged in, or if all agents are in AuxWork mode.

- Don't Answer  
Redirects calls to coverage if unanswered during the assigned Don't Answer Interval. A call rings for the Don't Answer Interval and then redirects to coverage.
- Cover All Calls  
Redirects all incoming calls to coverage. This criterion has precedence over any other criterion previously assigned.
- Send All Calls/Go to Cover  
Allows users to activate Send All Calls or Go to Cover as an overriding coverage criteria. This redirection criteria must be assigned before a user can activate Send All Calls or Go to Cover (discussed later).
- No Coverage  
Occurs when none of the above criteria are assigned. Calls redirect to coverage only when the principal has activated Send All Calls or the caller has activated Go to Cover. Both of these overriding criteria are discussed later.

Redirection criteria can be assigned in combinations. For example, you can combine Active/Don't Answer and Busy/Don't Answer. Other combinations are not possible or do not provide any useful function. For example, Active/Busy does not accomplish anything. A busy voice terminal is always active.

Redirection criteria are assigned separately for internal and external calls. By linking the coverage paths, Busy/Don't Answer can be assigned for internal calls and Active can be assigned for external calls. Similarly, Busy/Don't Answer can apply for external calls and No Coverage can apply for internal calls. In the latter case, internal calls remain directed to the called terminal or group.

All calls extended by the attendant are treated as external.

### Features that override Call Coverage

Some system features override Call Coverage criteria; they are checked before the redirection criteria are checked. These features are:

- Call Forwarding All Calls  
Call Forwarding provides a temporary override of the redirection criteria, if Send All Calls is not active. The call attempts to complete to the forwarded-to extension before redirecting to coverage. If the principal's redirection criteria are met at the forwarded-to extension, the call redirects to the principal's coverage path.
- Go to Cover  
Go to Cover allows users, when calling to another internal extension, to send the call directly to coverage. This is optionally assigned to a button on a voice terminal and is activated by the internal calling party. Use of Go to Cover is discussed later.

- Send All Calls

Send All Calls allows principals to temporarily direct all incoming calls to coverage regardless of the assigned redirection criteria. For example, if the redirection criteria are administered so that no calls redirect, all incoming calls terminate at the principal's voice terminal unless Send All Calls is activated. Also, Send All Calls allows covering users to temporarily remove their voice terminals from the coverage path.

Send All Calls is activated by pressing the Send All Calls button or by dialing the Send All Calls access code. It is deactivated by pressing the button a second time or by dialing the deactivate code.

A user who is not assigned a coverage path with Send All Calls or Cover All Calls redirection criteria, cannot activate Send All Calls.

Any attempt to activate Send All Calls is denied if the currently active coverage path does not allow it in its coverage criteria. However, if the user activates Send All Calls for a coverage path that does allow it, and then the user's coverage path is changed by the system to a coverage path that does *not* allow Send All Calls:

- The Send All Calls button remains lit.
- Send All Calls automatically resumes when the user is changed back to a coverage path that does allow it.

If a user has activated Send All Calls and has only one coverage point, and receives a call from that coverage point, the call rings silently at the user's voice terminal, because the coverage point is already on the call.

Send All Calls is similar to Cover All Calls, discussed previously. However, you set Cover All Calls and it is used for screening the principal's call. The principal may or may not be rung on an incoming call, depending on how this function is assigned. Send All Calls is controlled by the principal and is normally used when the principal is away temporarily.

TEG calls are not affected by Send All Calls.

- Send Term

Send Term is the Send All Calls equivalent for TEG. Since a TEG cannot be in a coverage path, Send Term applies only to a directly called TEG.

### Conditions that override Call Coverage

Call Coverage provides redirection of calls from the called principal or group to alternate answering positions when certain criteria are met. Certain provisions allow calls to direct to and/or be answered by the principal even though the redirection or overriding criteria are met. These provisions are:

- If no answering positions are available in the Coverage Path, the call rings the called voice terminal, if possible; otherwise, the calling party receives busy tone. This applies even if the Cover All Calls redirection criterion or the Send All Calls overriding criterion is active.

- Similarly, calls directed to a UCD or DDC group are queued, if queuing is available, when no group members are available to answer the call. The call remains in queue for the Don't Answer Interval before routing according to the coverage path. If no points on the path are available, the call remains in queue. The worst case is when group queuing and the coverage points are both unavailable. In this case, the caller receives busy tone or ringback, depending on the type of trunk carrying the call.
- If the redirection criterion is Active or Cover All Calls, a called principal can receive a redirection notification signal (a short burst of ringing) when the call routes to coverage. (Redirection Notification is optional on a per-terminal basis.) Note that in the Active, Cover All Calls, and Don't Answer cases, the principal could answer the call. Busy means no call appearances are available to answer the call. Redirected calls maintain an appearance on the called voice terminal, if possible. The call appearance status lamp flashes to indicate an incoming call before the call redirects. When the call does redirect, the status lamp lights steadily. The user can answer the call by pressing the call appearance button. If the call has already been answered, the principal is bridged onto the call. This provision is called Temporary Bridged Appearance.
- A voice-terminal user can use Directed Call Pickup to pick up a principal's call or a call alerting at a coverage point. Directed Call Pickup allows a voice-terminal user to answer an alerting call from any station on the DEFINITY ECS. That is, the alerting and answering stations do not need to be members of the same Call Pickup group. You enable and disable Directed Call Pickup on a system-wide base. However, permission to use the feature can be allowed or disallowed based on COR.
- Priority Calling, Dial Intercom, and Automatic Intercom Calls always route directly to the principal's voice terminal until the calling party activates Go to Cover. These calls take precedence over the redirection criteria and can seize the call appearance normally reserved for outgoing calls, if no other call appearances are available.

An internal calling party is informed that a call is redirecting to coverage by a single, short burst of ringing, called a Call Coverage tone. This tone is followed by an optional period of silence, called a Caller Response Interval. This interval allows the calling party time to decide what to do: hang up or activate Leave Word Calling, Automatic Callback, or Go to Cover. Activating Go to Cover cancels the remaining interval.

## Covering-user options

For specific Call Coverage needs, the following options are available to voice-terminal users:

- Consult
  - Allows the covering user, by first pressing the Transfer button and then the Consult button, to call the principal (called party) for private consultation. These two actions place the caller on hold and establish a connection

between the principal and the covering user. If the principal wishes, the covering user can complete the conference and add the calling party to the conversation. Similarly, the call can be transferred to the principal. Consult calls use the Temporary Bridged Appearance maintained on the call, if there is one. If not, the Consult call seizes any idle call appearance. If there is no idle call appearance, the Consult call is denied.

- Coverage Callback

Allows a covering user, by pressing the Cover Callback button, to leave a message for the principal to call the calling party. Coverage Callback uses Implied Principal Addressing to infer both extensions so that the covering user does not have to dial either the principal's or the caller's number. The caller must be an internal caller. The principal receives no indication that the covering user handled the call.

Alternatively, if the covering user presses the Leave Word Calling button, a "call me" message is left for the principal. The principal calls the covering user to get the message. This method is used when an external call is received or when an internal caller wants to leave a message but is not available for a return call.

- Coverage Answer Group

A Coverage Answer Group can have up to eight members. When a call is redirected to a Coverage Answer Group, all voice terminals in the group ring simultaneously. Anyone in the group can answer the call. A Coverage Answer Group member already handling a group call is rung when another call is redirected to that Coverage Answer Group. If a Coverage Answer Group member is also a member of another Coverage Answer Group, he or she can also receive calls for the other group. A second call directed to a Coverage Answer Group lights a Coverage Incoming Call Identification (ICI) lamp.

- Coverage Incoming Call Identification

A Coverage ICI button can be assigned to multiappearance voice-terminal users without a display in a Coverage Answer Group.

The Coverage ICI status lamp identifies a call incoming to that Coverage Answer Group. If a Coverage Answer Group is assigned to more than one Call Coverage path, the path number cannot be identified. Likewise, if a given path is assigned to more than one principal, the individual principals cannot be identified. To provide unique path and principal identification, you must establish a unique path for each principal and a unique Coverage Answer Group to be included in the path. A second coverage call takes control of the Coverage ICI lamp and does not return control to the previous call when the second call is released.

## Time-of-Day Coverage

The Time-of-Day Coverage Table allows you to redirect calls to different lead-coverage paths at different times of the day and on different days of the week.

For example, an employee may want incoming calls to cover to a co-worker (office) during normal business hours, to cover to an off-net destination (home) in the early evening, and to cover to AUDIX at all other times. By specifying the appropriate lead-coverage paths in the Time-of-Day Coverage Table, the employee can have the call redirection flexibility shown in [Table 4-38](#). (If you were actually administering a Time-of-Day Coverage Table, you would provide the lead-coverage path numbers that redirect the calls to the employee's office, to their home, and to AUDIX.

**Table 4-38. Time-of-Day Call Redirection example**

| Day of the Week | Time 1<br>Directed To        | Time 2<br>Directed To         | Time 3<br>Directed To       | Time 4<br>Directed To        |
|-----------------|------------------------------|-------------------------------|-----------------------------|------------------------------|
| Monday          | 00:00<br>CovPath3<br>(AUDIX) | 08:00<br>CovPath1<br>(Office) | 17:30<br>CovPath2<br>(Home) | 20:00<br>CovPath3<br>(AUDIX) |
| Tuesday         | 00:00<br>CovPath3<br>(AUDIX) | 08:00<br>CovPath1<br>(Office) | 17:30<br>CovPath2<br>(Home) | 20:00<br>CovPath3<br>(AUDIX) |
| Wednesday       | 00:00<br>CovPath3<br>(AUDIX) | 08:00<br>CovPath1<br>(Office) | 17:30<br>CovPath2<br>(Home) | 20:00<br>CovPath3<br>(AUDIX) |
| Thursday        | 00:00<br>CovPath3<br>(AUDIX) | 08:00<br>CovPath1<br>(Office) | 17:30<br>CovPath2<br>(Home) | 20:00<br>CovPath3<br>(AUDIX) |
| Friday          | 00:00<br>CovPath3<br>(AUDIX) | 08:00<br>CovPath1<br>(Office) | 17:30<br>CovPath2<br>(Home) |                              |
| Saturday        | 00:00<br>CovPath3<br>(AUDIX) |                               |                             |                              |
| Sunday          | 00:00<br>CovPath3<br>(AUDIX) |                               |                             |                              |

Time is represented in 24-hour format and activation times are ascending from the earliest to the latest. There are no gaps in the activation times; the entire day is covered. If you do not assign a lead-coverage path to a specific time interval, there is no coverage from that time until the next activation time with an assigned lead-coverage path.

When a call arrives at a principal, the system queries for the lead coverage path in effect at that time and uses that information to determine call redirection. If call coverage is changed via administration *while the call is in progress*, the administration changes do not affect that call.

## Off-Net Call Coverage

Call Coverage allows for redirection of a call to a destination that is on the public network. The remote (off-net) number is administered on the Remote Call Coverage Table form and may have up to 16 digits including the FAC specifying ARS or AAR, to the outgoing trunk access code (TAC). Any coverage point in a coverage path can be an off-net destination.

When the Coverage of Calls Redirected Off-Net Enabled field on the Feature-Related System Parameters form is enabled:

- The system monitors off-net calls (call classification) and brings them back to the switch if they are not answered within the defined time interval. (You set this interval in the Coverage Subsequent Redirection/CFWD No Answer Interval field on the Feature-Related System Parameters form.) Calls also return to the switch if the system detects a call progress tone, such as busy or reorder. Answer Supervision by Call Classifier on the System-Parameters Customer-Options form must be **y**.
- A simulated bridge appearance is put on the principal and the green lamp is put in flashing mode; the principal can pick up the call at any time.
- The switch plays local ringback tone to the caller while the off-net call is being classified. That call classification is fast, but not instantaneous. If a call is answered off-net, it is possible that the first few syllables spoken after answer will be covered up by this local ringback tone.
- If any party on the call is on HOLD when the call routes off net, the off-net call reverts to a non-call classified state. It behaves in the same manner as off-net calls when Coverage of Calls Redirected Off-Net is not enabled.
- While an off-net call is undergoing call classification, any party who is not already on the call will be unable to bridge onto the call. Also, the originating party cannot conference anyone else onto the call or transfer the call to a new party. Once the call is answered off-net or the call is returned to the switch for further call processing, then these restrictions are removed.
- In some instances more than one call classifier may be monitoring an off net (coverage/forwarding) call. If the call is answered and for some reason one of the call classifiers fails to detect the answer, the call may be disconnected and redirected to further coverage treatment.

- DEFINITY ECS has no control over any redirection of the call that may take place at an off-net destination. However, further coverage treatment will be provided if the Coverage Subsequent Redirection/CFWD No Answer Interval expires before the call is answered off-net.

If the `Coverage of Calls Redirected Off-Net` field is *not* activated, the system does not monitor off-net calls and bring them back for additional call-coverage processing. In this case, once a call is directed to the remote call-coverage point, the principal is dropped from the call.

## VDN in a Call Coverage path

Assigning a VDN extension as the last point in a Call Coverage path allows the functionality of Call Vectoring to be applied to a coverage point. The programmable vector associated with the VDN effectively can provide great flexibility in call handling. The integration of the Call Vectoring and Call Coverage features can drive powerful AUDIX and Message Server applications.

For example, you can program the vector assigned to the VDN in the coverage path to queue a redirected call to a messaging split for call answer operation and to allow the caller to leave a message for the called principal. The same VDN can also be used to retrieve messages. The vector program may also be varied by time of day or split status to provide different types of coverage.

When a redirected call covers to a VDN, the principal's temporary bridged appearance is removed when vector processing begins. VDN override does not apply to calls that are redirected by Call Coverage.

When covered or direct calls are connected to AUDIX or a messaging split via call vectoring, the original reason for redirection and the called principal must be passed to the adjunct over the Switch Communication Interface (SCI) link. Also the VDN number must be entered (rather than the split extension) in the `Group Extension` field on the Hunt Group form.

Use of a VDN as a coverage point provides integration to Centralized Messaging. That is, the Distributed Communications System (DCS) message sent to the remote switch with AUDIX includes the original reason for redirection and called principal.

An administration change is required to allow an extension that is assigned as a VDN to be entered as the last point in the coverage path. See *DEFINITY Enterprise Communications Server Call Vectoring/EAS Guide* for more information.

## Extended User Administration of Redirected Calls

The Extended User Administration of Redirected Calls feature (also called telecommuting access) allows system users to change their lead-coverage path or their call-forwarding designated destination from any on-site or off-site location. See "[Extended User Administration of Redirected Calls](#)" on page 4-333 for more information on this feature.

## Measurements and reports

---

Three reports provide measurement information about Call Coverage:

- The Coverage Path Measurement Report describes coverage activity as it relates to the coverage paths.
- The Principal Coverage Measurement Report describes coverage activity as it relates to the principal extensions.
- The Call Detail Recording (CDR) shows the outgoing trunk calls.

For each report, a selection form lists the specific coverage paths or principal extensions to be measured. For more detailed information on these reports and their associated commands, see *DEFINITY Enterprise Communications Server Release 5 System Monitoring and Reporting*.

## Considerations

---

- Incoming tie-trunk calls can be administered as either internal or external and are redirected to Call Coverage accordingly.

## Guidelines and examples of Call Coverage

---

Call Coverage is an extremely flexible feature and allows several combinations of coverage points. To illustrate the usefulness of Call Coverage, three typical coverage arrangements are given below.

- Executive Coverage

Provides a principal with call redirection to covering users having a close working relationship with the principal. Because of the status of the principal, personalized answering should be provided. Also, the principal may or may not choose to answer his or her own calls.

Redirection of a principal's calls to a secretary is a typical example of this form of coverage. The secretary would be informed of the principal's daily schedule and other useful information such as the importance of certain calls. The secretary could provide personalized answering by answering calls with the principal's name.

If the secretary is unavailable to answer the coverage call for the principal, the call redirects to a backup answering position. Personalized answering should also be provided at the backup position.

- Middle Manager Coverage

Provides a group of principals with call redirection to one or more covering users (such as a secretary). The secretary should have some knowledge of the principal's daily schedule. A backup answering position should be provided in case the secretary is unavailable.

- General User Coverage

Provides less-personal coverage for a broader spectrum of users. Covering users typically consist of a group or pooled answering arrangement. Coverage calls may be distributed among the members of the answering group.

Following is an example of how to provide an Executive Coverage arrangement.

1. Determine if the secretary and backup position have a call display capability.
  - If so, Coverage Answer Groups are not required.
  - If not, establish a unique Coverage Answer Group for each one without a display. Specify only the applicable extension. The Coverage Answer Group contains only one member. Establish two groups, if required. Note that, if the secretary and/or backup answering position are in a Coverage Answer Group, each receives only one redirected call for the executive at any given time. Calls do ring a Coverage Answer Group member already busy on a call to the group. For frequently called executives, the secretary and possibly the backup answering position should have digital-display capability.
2. Establish a unique Call Coverage Path for the executive.
  - If the secretary screens calls, specify Cover All Calls as the redirection criteria.
  - If the executive answers calls, specify Active, Busy, Don't Answer, Active/Don't Answer, or Busy/Don't Answer as desired.
  - Specify the secretary and the backup position (or the Coverage Answer Groups containing the secretary's and backup position's extensions) as the coverage points in the path.
3. Optionally, specify a Send All Calls button on the executive's voice terminal. If someone else answers the executive's calls, the button is not needed.
4. Specify a Send All Calls button and a Consult button on the secretary's voice terminal. Specify a Coverage ICI button if the secretary does not have a call display. Send All Calls is needed if the secretary is unavailable for a period of time. Consult is needed to enable private consultation with

the executive during an established call. Coverage ICI is needed to identify the call as a call to the executive rather than a personal call to the secretary.

5. Specify a Consult button and a Coverage ICI button on the backup position's voice terminal for the same reasons that these buttons were specified for the secretary.

4 Basic Features  
 Call Coverage

**EXAMPLE 1 COVERAGE PATH FOR OUTSIDE CALLS**

call type - OUTSIDE

CRITERIA - busy, don't answer, and send all calls (when activated)

**EXAMPLE 2 COVERAGE PATH FOR INSIDE CALLS**

call type - INSIDE

criteria - BUSY AND DON'T ANSWER (SEND ALL CALLS NOT ACTIVATED)

**EXAMPLE 3 COVERAGE PATH FOR INSIDE CALLS**

call type - INSIDE

criteria - SEND ALL CALLS ACTIVATED

Figure 4-1. Coverage path examples

Figure 4-2. Coverage Path form examples

## Interactions

---

### ■ Administration without Hardware

Stations administered without hardware translation interact with Call Coverage as if all their call appearances are busy. A disassociated station can have Call Coverage active for the following call-coverage groups:

- Coverage answer groups
- Hunt groups
- Intercom groups
- Pickup groups
- Terminating Extension Groups (TEGs)
- Vector Directory Number (VDN)

### ■ Agent Call Handling

Do not assign Cover All Calls to agents with the Automatic Answer option. Any call (ACD or non-ACD), to an extension that has Automatic Answer enabled and has its coverage redirection criteria administered as Cover All Calls does not go to coverage but to the called extension. Cover All Calls redirection criteria have no effect on an incoming call when a user is in the Auto-Answer mode.

### ■ Automatic Callback and Ringback Queuing

Callback calls do not redirect to coverage. The caller can activate Automatic Callback when ringing, redirection notification signal, or busy signal is heard.

### ■ Automatic Intercom, Dial Intercom, and Priority Calling

Calls using these features are not redirected to coverage unless the caller presses the Go to Cover button.

### ■ Bridged Call Appearance

Coverage criteria for bridged call appearances are based entirely on the criteria of the primary extension associated with the bridged call appearance.

If a voice-terminal user has activated Send All Calls on the primary extension, incoming calls still ring bridged call appearances of that extension as long as a temporary bridged appearance of the call is maintained at the primary extension.

The switch blocks a user from bridging onto a call that has routed off-net while the call is undergoing call classification.

- Call Detail Recording

When Coverage of Calls Redirected Off-Net is enabled, a CDR record is generated only after the call has actually been answered off-net. The dialed number in the record is the off-net number to which the call covers. The calling number is the station that is covered to the off-net location.

- Call Forwarding

Call Forwarding provides a temporary override of the redirection criteria. Normally, calls forward instead of redirecting to coverage. When a forwarding extension's redirection criteria are met at the designated (forwarded-to) extension, the call redirects to the forwarding extension's coverage path.

The system allows calls forwarded off-net to be tracked for busy or no-answer conditions and to return for further call-coverage processing under those conditions. However, if the principal does not have a coverage path, the system does not track the call and it is left at the off-net destination regardless of whether it is answered or busy.

If the principal has Send All Calls activated, the system does not attempt Call Forwarding Off-Net, except for priority calls. Likewise, the system does not attempt Call Forwarding Off-Net for coverage paths that specify Cover All, except for priority calls.

If Cover All Calls is part of the coverage redirection criteria and if Call Forwarding is active at a voice terminal, incoming priority calls forward to the designated extension.

The Redirection Notification Signal applies to both Call Coverage and Call Forwarding.

If an extension has both Send All Calls and Call Forwarding activated, calls to that extension that immediately can be redirected to coverage are redirected. However, other calls, such as Priority Calls, are forwarded to the designated extension.

Activation of Send All Calls at the forwarded-to extension does not affect calls forwarded to that extension.

- Call Pickup

Any call redirected to a covering user who is a member of a Call Pickup group can be answered by other members of the group.

- Centralized Attendant Service

If an incoming CAS call is directed to a hunt group, the call is not redirected to the hunt group's coverage path.

- Class of Restriction and Controlled Restrictions

Users who may normally be restricted from receiving calls can still receive calls directed to them via Call Coverage.

- Conference

The switch blocks users from conferencing another party onto a call which has routed off-net while that call is undergoing call classification. If any party on the call is on hold, the call routes off-net, but without undergoing call classification, even when the `Coverage of Calls Redirected Off-Net` is enabled.

- Direct Department Calling, Uniform Call Distribution, and Automatic Call Distribution

If a user has an `Auxiliary Work` button, and activates or deactivates `Send All Calls`, the `Auxiliary Work` function associated with DDC or UCD is activated or deactivated simultaneously.

If a user has no `Auxiliary Work` button, activating or deactivating `Send All Calls` still makes the user available or unavailable for DDC and UCD calls, but `Auxiliary Work` is not activated or deactivated. The `Auxiliary Work activate or deactivate code` and the DDC, UCD, and ACD extension must be dialed to activate the `Auxiliary Work` function.

Activating or deactivating the `Auxiliary Work` function does not activate or deactivate `Send All Calls`.

- Hold

If a covering user puts a call on hold, and the principal picks up on the call, the coverage appearance may or may not be dropped, depending on administration.

If any party is on hold when a coverage call routes off-net, that call does not undergo call classification, even when `Coverage of Calls Redirected Off-Net` is enabled.

- Internal Automatic Answer

If an internal call is redirected to another voice terminal by a `Call Coverage` redirection criteria, then that call is eligible for IAA at that voice terminal.

IAA does not apply to calls to the original called extension when:

- The called voice terminal has activated `Do Not Disturb`, `Send All Calls`, or `Cover All Calls`
- The calling voice terminal has selected `Go To Cover` before placing the call

Calls directed to a `Coverage Answering Group` are not eligible for IAA.

- Leave Word Calling

`Call Coverage` can be used with or without LWC. However, the two features complement each other. When a covering user activates LWC during a coverage call, a message is left for the principal to call the covering user. When a covering user activates `Coverage Callback` during a coverage call, a message is left for the principal to call the internal caller.

- Night Service

Calls routed to the night station via Night Service follow the coverage path of the night extension under all coverage criteria except Send All Calls.

- Privacy — Manual Exclusion

When the primary or principal user bridges onto a call that went to coverage and has been answered at the coverage point, the user is not dropped when Privacy — Manual Exclusion is activated.

- Temporary Bridged Appearance

Calls redirected to coverage maintain an appearance on the called voice terminal if a call appearance is available to handle the call. The called party can bridge onto the call at any time. The system can be administered to allow a temporary bridged appearance of the call to either remain at or be removed from the covering voice terminal after the principal bridges onto the call.

A Temporary Bridged Appearance is maintained for calls covered by an off-net coverage point if the Coverage of Calls Redirected Off-Net feature is enabled. A Temporary Bridged Appearance cannot be maintained for calls if the coverage point is linked to AUDIX.

Consult calls use the temporary bridged appearance maintained on the call. At the conclusion of a consult call, the bridged appearance is no longer maintained. If the principal chooses not to talk with the calling party, the principal cannot bridge onto the call later.

If a call that has, or has had, a temporary bridged appearance is conferenced or transferred, and redirects to coverage again, a temporary bridged appearance is not maintained at the conferenced-to or transferred-to extension.

- Tenant Partitioning

The caller and called party must be able to access a coverage point. The caller is considered to be the covering user and the called party is considered to be the covered user. Both parties must be able to access the coverage point.

- Transfer

The switch blocks a user from transferring a call which has routed off-net to another party while that call is undergoing call classification. If any party on a call that has routed off-net is on hold, the call does route off-net without undergoing call classification, even when Coverage of Calls Redirected Off-Net is enabled.

Transfer interacts with Call Coverage as listed in the following table.

| <b>Source</b> | <b>Transfer initiator</b> | <b>Destination</b> | <b>Coverage type</b> |
|---------------|---------------------------|--------------------|----------------------|
| External      | Local station             | Local station      | External             |
|               | Local station             | Remote station     | External             |
|               | Remote station            | Local station      | Internal             |
|               | Remote station            | Remote station     | Internal             |
|               | Attendant                 | Local station      | External             |
|               | Attendant                 | Remote station     | External             |
| Internal      | Local station             | Local station      | Internal             |
|               | Local station             | Remote station     | Internal             |
|               | Remote station            | Local station      | Internal             |
|               | Remote station            | Remote station     | Internal             |
|               | Attendant                 | Local station      | External             |
|               | Attendant                 | Remote station     | External             |

**NOTE:**

The coverage criteria for transferred DID calls depends upon the `External Treatment For Transferred Incoming Calls` field on the Feature-Related System Parameters form.

## Call Detail Recording

---

Call Detail Recording (CDR) collects detailed information about all incoming and outgoing calls on specified trunk groups and, if you use intraswitch CDR, about calls between designated extensions on the switch. It sends this information to a printer or other CDR output device that may also provide reports.

You can use this information to compute call costs, allocate charges, analyze calling patterns, detect unauthorized calls, and keep track of unnecessary calls. For additional information on CDR, see Call Detail Acquisition and Processing Reference.

Call Detail Recording has the following capabilities:

- Account Code Dialing and Forced Entry of Account Codes (FEAC)
- Call Splitting for Incoming and Outgoing Trunks
- Intraswitch CDR
- Privacy

### How to administer CDR

---

#### Required forms

| Form                                       | Field                          | Page                  |
|--|--------------------------------|-----------------------|
| Trunk Groups                               | ■ CDR Reports                  | <a href="#">7-115</a> |
|  | ■ Answer Supervision Timeout   |                       |
|  | ■ Disconnect Supervision       |                       |
| CDR System Parameters                      | ■ All                          | <a href="#">5-63</a>  |
| Inter-exchange Carrier Codes               | ■ All                          | <a href="#">5-177</a> |
| Feature Access Code (FAC)                  | ■ CDR Account Code Access Code | <a href="#">5-113</a> |
| Netcon Data Module                         | ■ All                          | <a href="#">6-245</a> |
| System Port Data Module                    | ■ All                          | <a href="#">6-248</a> |
| Loudspeaker Paging and Code Calling Access | ■ CDR                          | <a href="#">5-209</a> |

- Assign a netcon channel using the Data Module form and enter data-channel or netcon channel for the type.
- Assign a system port using the Data Module form and enter system port for the type.

- A Data Line circuit pack can also be used in conjunction with an ADU to connect to an output device. If the CDR output device is connected to a Data Line circuit pack via an ADU, administer a Data Line Type Data Module.

For more information about how to connect a CDR output device, see *DEFINITY Enterprise Communications Server Release 6 Installation for Adjuncts and Peripherals*.

## How to administer Account Code Dialing

### Required forms

| Form                      | Field  | Page                  |

## Detailed description

CDR tracks call information on a per-trunk-group or station-to-station basis. For every trunk group (including auxiliary trunks) that you administer for CDR reports, the system keeps track of incoming, outgoing and tandem calls. You can also receive reports on temporary signaling connections (TSCs) that involve trunks, and calls made using loudspeaker paging or code calling access.

You can also ask the system to report on ineffective call attempts. This may greatly increase the number of calls recorded, but may also help you to increase security, since the system records call attempts that are blocked because of insufficient calling privileges. This can also let you know if your users are not able to make calls because all trunks are busy.

Some call accounting systems do not support all of the information offered by CDR. See your Lucent Technologies representative for details.

## Account Code Dialing

Account Code Dialing allows certain calls to be associated with a particular project or account number. To do this, users enter account codes when they place certain types of outgoing calls. These account codes then appear on the call record, which you can use for accounting or billing purposes. Account code dialing can be optional or mandatory (forced).

To associate an account code with a particular call, a user first dials the CDR account code access code that you have established, then dials the desired account code. Next, the user dials the desired trunk access code, or ARS access code, followed by the phone number.

The call record contains the account code, TAC or ARS access code, and the phone number. It does not contain the account code FAC.

## Forced Entry of Account Codes

You can force your users to enter account codes on a system-wide, per-trunk or per-user basis, or on the basis of the digit string the user dials. If you have this feature in place, the system rejects any call that requires an account code where one is not supplied. To maximize system security, it is recommended that you use Forced Entry of Account Codes (FEAC).

### SECURITY ALERT:

*DEFINITY ECS does not verify account codes. As long as the user enters a digit string of the appropriate length, the system allows the call. You must use Authorization Codes if you want the system to determine if the user is authorized to make the call.*

You can assign FEAC in the following ways:

- All calls marked for FEAC on the Toll Analysis table  
If you activate this CDR system parameter, all users must dial an account code when the digits dialed match a digit string with FEAC=y. This includes calls made by ARS or TAC.
- Toll calls made by users with a specific class of restriction (COR)  
If FEAC is assigned to a specific COR, any voice-terminal user assigned that COR must dial an account code before making calls that are administered forced entry of account codes.
- All calls made over a trunk group with FEAC in COR (TAC calls)  
Users cannot access a trunk group that is assigned a COR with FEAC until they dial an account code. If a call is routed via ARS, the system does not check for FEAC in the trunk group's COR. Therefore, if you want your users to enter account codes for ARS calls, you must administer this in the Toll Analysis table.

If an account code is required for a call and the user does not enter one, the system responds with intercept tone.

The following types of calls never require an account code:

- Attendant originated call
- Busy verification of a trunk by an attendant or voice-terminal user
- DCS (unless required by the trunk group's COR)
- Personal CO Line
- Remote access without barrier codes
- Trunk-to-trunk connections

## Call Splitting

Call splitting keeps track of calls where more than two parties are involved. These can be calls that are transferred, conferenced, or where an attendant becomes involved. If you have call splitting activated and any of these situations arise, CDR produces a separate record for each new party on the call.

You can administer call splitting for both incoming and outgoing trunks, and both can have attendant calls recorded separately.

### Incoming trunk call splitting

If incoming trunk call splitting is enabled, CDR starts a new record whenever an incoming trunk call is conferenced or transferred. Whenever a user drops from the call or the call is successfully transferred, CDR outputs the record relevant to this user's participation. These call records show the amount of time each party was on the call, the incoming trunk access code, the dialed number and the condition code, as well as the other fields specified in the record format.

For incoming trunk calls that are conferenced, CDR creates a new record whenever a new party comes on the call. The duration field in these records shows how long each party participated on the call. Conference calls produce records with duration fields that overlap. The duration of a transferred call begins when the transferring party presses the TRANSFER button for the second time, so there is no overlap.

If ITCS is enabled and an incoming trunk call is conferenced or transferred to a local extension that is optioned for Intraswitch CDR, the call produces an incoming trunk call record. It does not produce an Intraswitch record.

### ITCS examples

The following scenarios depict calls made with ITSC active. The tables that follow do not show all fields, only those that may change due to call splitting. Call durations are approximate.

Caller A (TAC 123) makes an incoming trunk call to switch party B (5657890). They talk for 2 minutes. B then conferences in C (ext. 54321), and D (ext. 59876). The entire group talks for another 8 minutes, at which point B drops off the call. This produces a record for segment A–B.

A, C and D continue to talk for another 5 minutes. All remaining parties drop, producing two more records; A–C and A–C. Note that each record shows the incoming trunk ID as the calling number.

**Table 4-39. ITCS conference**

| Segment | Duration | Condition Code | Access Code Used | Calling Number | Dialed Number |
|---------|----------|----------------|------------------|----------------|---------------|
| A–B     | 0:10:0   | C              |                  | 123            | 5657890       |
| A–C     | 0:13:0   | C              |                  | 123            | 54321         |
| A–D     | 0:13:0   | C              |                  | 123            | 59876         |

A (TAC 123) calls Station B (57890). They talk for 1 minute, then B transfers the call to C (54321). CDR generates a record for segment A–B. A and C talk for 5 minutes. CDR generates a record for segment A–C.

**Table 4-40. ITCS transfer**

| Segment | Duration | Condition Code | Access Code Used | Calling Number | Dialed Number |
|---------|----------|----------------|------------------|----------------|---------------|
| A–B     | 0:01:0   | 9              |                  | 123            | 5657890       |
| A–C     | 0:05:0   | 9              |                  | 123            | 54321         |

A (TAC 123) calls switch party B (5657890), they talk for one minute. B transfers the call to public-network party C (5665555), they talk for 4 minutes. Note that the duration of the original incoming trunk call includes the time after the call was transferred to an outgoing trunk, until all trunk parties drop.

**Table 4-41. ITCS transfer to outgoing trunk**

| Segment | Duration | Condition Code | Access Code Used | Calling Number | Dialed Number |
|---------|----------|----------------|------------------|----------------|---------------|
| A–B     | 0:05:0   | 9              |                  | 123            | 5657890       |
| A–C     | 0:04:0   | 9              | 345              | 123            | 5665555       |

### Outgoing trunk call splitting

If outgoing trunk call splitting is active, CDR creates records of transferred calls as described above for incoming trunk call splitting. For conferenced calls, the originator of the conference will be charged until he or she drops from the call, at which point CDR begins a second record for the conferenced user. Records for parties on a conference do not overlap; they are split.

### OTCS examples

In the next example, switch party A (57890) calls B(7771234), talks for 5 minutes, then conferences in C (7775678). They all talk for another 5 minutes, at which point all parties drop.

Table 4-42. OTCS conference

| Segment | Duration | Condition Code | Access Code Used | Calling Number | Dialed Number |
|---------|----------|----------------|------------------|----------------|---------------|
| A-B     | 0:10:0   | C              | 345              | 57890          | 7771234       |
| A-C     | 0:05:0   | C              | 345              | 57890          | 7775678       |

Switch party A (51234) calls public-network party B (5659999). They talk for 5 minutes. A then transfers the call to switch party C (54444).

Table 4-43. OTCS transfer

| Segment | Duration | Condition Code | Access Code Used | Calling Number | Dialed Number |
|---------|----------|----------------|------------------|----------------|---------------|
| A-B     | 0:01:0   | A              | 345              | 51234          | 5659999       |
| C-B     | 0:05:0   | A              | 345              | 54444          | 5659999       |

### Attendant call recording

Both incoming and outgoing call splitting give you the option of recording the attendant portion of calls that are transferred. To enable this option, set Incoming and/or Outgoing Attendant Call Record to **y**.

If either incoming or outgoing trunk call splitting is enabled, the attendant portion of a conference call always produces a separate record.

### Attendant call recording examples

Public-network party A (TAC 123) calls the attendant (Attd), and asks to be transferred to switch party B (58888).

**Table 4-44. Attendant transfer incoming trunk**

| Segment | Duration | Condition Code | Access Code Used | Calling Number | Dialed Number |
|---------|----------|----------------|------------------|----------------|---------------|
| A-Attd  | 0:01:0   | 9              |                  | 123            | Attd          |
| A-B     | 0:05:0   | 9              |                  | 123            | 58888         |

The attendant (Attd) dials switch party A (59999), then transfers the call to public-network party B (4445678).

**Table 4-45. Attendant transfer outgoing trunk**

| Segment | Duration | Condition Code | Access Code Used | Calling Number | Dialed Number |
|---------|----------|----------------|------------------|----------------|---------------|
| Attd-B  | 0:01:0   | A              | 345              | Attd           | 4445678       |
| A-B     | 0:05:0   | A              | 345              | 59999          | 4445678       |

### Intraswitch CDR

Intraswitch CDR generates call records for calls to and from users on the local switch. For the system to generate an intraswitch CDR record, one of the extensions involved in a call must have intraswitch CDR assigned.

If a station is optioned for Intraswitch CDR, and ITCS is also enabled, ITCS overrides Intraswitch CDR. That is, incoming trunk calls involving the station produce trunk call records, not Intraswitch CDR records.

The output for intraswitch CDR follows the same format you have established for other call records. Certain fields do not appear on intraswitch call records, because they do not pertain to internal calls. For example, an intraswitch record does not contain trunk access codes or circuit IDs, since these do not apply.

Some calls may seem to be intraswitch CDR calls, but actually result in trunk calls. For example, a station-to-station call to an extension that is forwarded to an outgoing trunk produces only a trunk CDR record, regardless of whether or not either station has intraswitch CDR assigned.

You can assign intraswitch CDR to terminating extension groups (TEGs), stations, data modules, VDNs, PRI endpoints, access endpoints, or hunt groups. The number that appears in the dialed number field depends on whether you have administered CDR System Parameters to record hunt group/member or

VDN information. You *cannot* assign intraswitch CDR to attendant consoles or CallVisor ASAI stations.

 **NOTE:**

If an extension with intraswitch CDR is neither the originator of the call nor the dialed number of the call, the system does not produce a call record, even though the extension might be a party on the call (via Call Pickup, Call Forwarding, etc.).

## Privacy

CDR Privacy allows you to administer the system to blank a given number of dialed digits from a CDR report. This is useful when it is necessary to know details of a person's calls for accounting purposes, but it is not necessary or desirable to know the exact number called.

You can administer the number of digits to hide, up to 7. The value in Privacy Digits to Hide determines how many digits do not appear on the call record. This parameter is system-wide. Whether or not an individual's calls receive Privacy treatment is determined by the CDR `Privacy` field on the Station form.

When an adjunct-originated call is made on behalf of a hunt group and the CDR system parameter `Calls to Hunt Group - Record` option is set to **group-ext**, then CDR privacy does not apply. If this field is set to **member-ext**, privacy does apply.

 **NOTE:**

Certain countries have requirements that a certain number of digits must be blanked from every call. Also, certain report processors do not support this option.

## CDR output

If your system uses two CDR output formats, one is administered as the primary CDR output format; the other is administered as the secondary CDR output format. The secondary output format is typically used for a local storage format (CDRU) to provide CDR data to NCOSS for assessing network performance or helping to find network problems.

The primary and secondary ports work independently. Each port will work even if the link to the other port is down. If a link is down for more than a minute, some data may be lost. However, the most recent 500 (Release 5vs/si/csi and later), or 1,900 (Release 5r and later) records are stored for the primary port even when a loss of records occurs. When the link comes back up, these records are output on a first-in, first-out basis.

If the CDR buffer is full, you can select a call record handling option to determine which of the following occurs:

- Calls are blocked with a reorder tone
- Calls overwrite records
- Calls are routed to an attendant as non-CDR calls

Overwrite old CDR records with new ones if the buffer is full.

The following information applies to the port used for the secondary CDR output device:

- Data going to the secondary port should be the same as that going to the primary port. You can use the following record types for secondary output: LSU, Int-Direct, Int-Process, and Unformatted.
- If the system experiences problems in sending records to the primary CDR Output Device, the system discontinues sending records to the secondary port for 2 minutes. The secondary port should be run at the highest possible speed in order to prevent loss of information.
- If the output buffer is full, the system busies out the secondary port for 2 minutes. This makes system resources available to send data to the primary CDR port before the data is lost. The system continues to busy out the secondary port for 2-minute intervals until less than 400 records (1800 for Release 5r and later) remain in the buffer.

## CDR Record formats

---

Two types of formats are sent to the CDR output device, date record and call detail formats.

### Date record format

CDR sends date information to the CDR device once a day (at midnight), or when the device is connected. This is a non-call record, and contains only the information shown in the date record formats below.

Several formats are available for date records: one for CDRUs, one for the printer, and one for the TELESEER. The records sent to the TELESEER and printer contain the date only while the records sent to the CDRU contain time. See [Table 4-46](#), [Table 4-47](#), and [Table 4-48](#).

### NOTE:

The date can be in month/day *or* day/month format, as selected on the CDR System Parameters form. The date/time may also be reversed for international standards.

**Table 4-46. Date Record Format to LSU, LSU-Expand, Unformatted, and Customized**

| <b>Position</b> | <b>Data Field Description</b>        |
|-----------------|--------------------------------------|
| 1-2             | Hour (leading 0 added if needed)     |
| 3               | Colon (:)                            |
| 4-5             | Minute (leading 0 added if needed)   |
| 6               | Blank                                |
| 7-8             | Month (Leading Zero Added if Needed) |
| 9               | Slash (/)                            |
| 10-11           | Day (leading 0 added if needed)      |
| 12              | Carriage return                      |
| 13              | Line feed                            |
| 14-16           | Null                                 |

**Table 4-47. Date Record Format for Printer and Expanded**

| <b>Position</b> | <b>Data Field Description</b>     |
|-----------------|-----------------------------------|
| 1-2             | Month (leading 0 added if needed) |
| 3               | Space                             |
| 4-5             | Day (leading 0 added if needed)   |
| 6               | Carriage return                   |
| 7               | Line feed                         |
| 8-10            | Null                              |

**Table 4-48. Date Record Format for TELESEER 59 Character, Int-Proc, Int-Direct, and Int-ISDN**

| <b>Position</b> | <b>Data Field Description</b>     |
|-----------------|-----------------------------------|
| 1-2             | Month (leading 0 added if needed) |
| 3-4             | Day                               |
| 5               | Carriage return                   |
| 6               | Line feed                         |
| 7-9             | Null                              |

## **Call Detail Record Formats**

### **Customized Format**

You can use the customized record format to make up your own call record. You can determine the data elements you want and their positions in the record. This method may be necessary if you want to include certain data elements that are not available on the standard formats.

However, whatever device you use to interpret the CDR data needs to be programmed to accept these formats. Consult your Lucent Technologies representative before using a custom record format.

**Table 4-49. CDR Data Format — TELESEER**

| <b>Position</b> | <b>Data Field Description</b> |
|-----------------|-------------------------------|
| 1-3             | Space                         |
| 4-5             | Time of day-hours             |
| 6-7             | Time of day-minutes           |
| 8               | Duration-hours                |
| 9-10            | Duration-minutes              |
| 11              | Duration-tenths of minutes    |
| 12              | Condition code                |
| 13-15           | Access code dialed            |
| 16-18           | Access code used              |
| 19-33           | Dialed number                 |
| 34-38           | Calling number                |
| 39-53           | Account code                  |
| 54              | FRL                           |
| 55              | IXC                           |

## Call detail record field description

The following list describes the CDR data collected for each call and the number of digits in each field. All information is right adjusted in the respective field, unless otherwise indicated. Where the field name for customized records is different from the standard, the custom field name appears in parentheses.

- **Access Code Dialed** (code-dial) — 3 or 4 digits

The access code the user dialed to place an outgoing call. This can be the ARS access code, AAR access code, or the access code of a specific trunk group. This field is also used to record the X.25 Feature Access Code of an outgoing X.25-addressed call.

- **Access Code Used** (code-used) — 3 or 4 digits

This field is used only for outgoing calls when the trunk group used is different from the access code dialed. It is not used when a TAC is dialed. For example, your system may use a feature access code for ARS. This field contains the access code of the actual trunk group that the call was routed over. When the dialed and used access code are the same, this field will be blank.

If you use ISDN or enhanced formats with TELESEER, LSU, or Printer record types, this field always shows the access code of the trunk group, even if it is the same as the access code dialed.

- **Account Code** (acct-code) — up to 15 digits

This field may contain a number to associate call information with projects or account numbers. For some formats, a long account code overwrites spaces on the record that are assigned to other fields.

- **Attendant Console** (attd-console) — 2 digits

This field contains the attendant console number of the attendant that handled the call in a record that is marked as being attendant handled.

- **Authorization Code** (auth-code) — 4–7 digits

This field contains the authorization code used to make the call. For non-ISDN and ISDN LSU formats, the authorization code is fewer than 6 digits in length. It is 5 for Enhanced LSU. On the 59-character record, the authorization code is never recorded.

- **Bandwidth** — 2 digits

Used to capture the bandwidth of the wideband calls to support H0, H11, H12, and N x 64 kbps data rates. For Enhanced Expanded, Enhanced Unformatted and customized record formats, this value is expressed as the number of DSOs of 64 Kbps channels comprising a call.

■ **Bearer Capability Class (bcc)** — 1 digit

This field contains the BCC for ISDN calls, identifying the type of an ISDN call. It will distinguish between voice and different types of data. The BCC is a single digit. Any one of the following may appear in this field.

- 0 = Voice Grade Data and Voice
- 1 = Mode 1 (56 kbps synchronous data)
- 2 = Mode 2 (less than 19.2 kbps synchronous or asynchronous data)
- 3 = Mode 3 (64 kbps data for LAPD protocol)
- 4 = Mode 0 (64 kbps data clear)
- w = Wideband

Intraswitch CDR outputs a value in this field for Wideband calls only.

■ **Calling Number (calling-num)** — up to 10 digits

For outgoing or intraswitch calls, this field contains the extension number of the originating voice-terminal user. For incoming and tandem calls, this field contains the TAC in standard formats. The fifth digit is the first digit of a 5-digit dialing plan. In formats where the field is less than 7 digits, this also shows the TAC of the incoming call.

This field shows the calling party number in Unformatted or Expanded records. If the CPN is not available, this field is blank for both formats.

This field contains the local extension of the NCA-TSC endpoint when the CDR record is for an outgoing (or originating) NCA-TSC. This field is blank for other NCA-TSC CDR records (that is, terminating, tandem, or unsuccessful).

■ **Calling Number/Incoming TAC (clg-num/in-tac)**

You can use this field on a customized record to display the calling number if it is available. If calling party number is not available, this field contains the Incoming TAC. For outgoing calls, this field contains the calling extension.

■ **Carriage Return (return)**

The ASCII carriage return character followed by a line feed indicates the end of a call record.

■ **Condition Code** — 1 character

The condition code indicates what type of call this record describes. For example, condition code C indicates a conference call, 7 indicates an ARS call, etc.

[Table 4-67](#) shows condition codes for most record formats. The 59-character format uses different condition codes from those used for other record types. The codes that apply to 59-character records appear in parentheses in the table.

**Table 4-67. Condition Codes**

| Condition Codes | Description  |
|-----------------|--|
| 0               | Identifies an intraswitch call (a call that originates and terminates on the switch).  |
| 1 (A)           | Identifies an attendant-handled call or an attendant-assisted call (except conference calls).  |
| 4 (D)           | Identifies an extremely long call (10 hours or more) or an extremely high message count TSC (9999 messages or more). On a call exceeding 10 hours, a call record with this condition code and a duration entry of 9 hours, 59 minutes, and 1–9 tenths of a minute is produced after the first period. A similar call record with this condition code is produced after each succeeding 10-hour period. When the call does terminate, a final call record with a different condition code identifying the call type is produced.  |
| 6 (E)           | Identifies calls that are not recorded because of resource exhaustion. A record with this condition code is only generated for calls that are routed to the attendant or calls that require CDR to overwrite records. This record includes the time and duration of the outage.  |
| 7 (G)           | Identifies calls served by the AAR or ARS Selection feature.   |
| 8 (H)           | Identifies calls which have been served on a delayed basis via the Ringback Queuing feature.   |
| 9 (I)           | Identifies an incoming or tandem call, or an incoming or tandem NCA-TSC.   |
| A               | Identifies an outgoing call.   |
| B               | Identifies an adjunct-placed outgoing call.  |
| C (L)           | Identifies a conference call. For trunk CDR, a separate call record with this condition code is produced for each incoming or outgoing trunk serving the conference connection. The only voice terminal recorded for a conference call is the conference call originator, provided ITCS and OTCS are disabled. For intraswitch CDR, if the originator is optioned for intraswitch, each time the originator dials a non-trunk party a separate call record is produced with this condition code, provided ITCS is disabled. If the originator is not optioned for intraswitch CDR, a separate record with this condition code is produced for each intraswitch party dialed. |

*Continued on next page*

Table 4-67. Condition Codes — Continued

| Condition Codes | Description  |
|-----------------|--|
| E (N)           | An ineffective call attempt due to facilities not being available, such as all trunks are busy and either no queuing exists or the queue is full on an outgoing call, or the called voice terminal is busy or unassigned for an incoming call attempt. This also means an ISDN Call By Call Service Selection call was unsuccessful because of an administered trunk usage allocation plan. Incoming trunk calls to a busy terminal do <i>not</i> generate a CDR record. |
| F               | Identifies an ineffective call attempt because of either insufficient calling privileges of the originator (assigned per FRL), ISDN calls rejected by the switch due to an NSF mismatch, or an authorization mismatch which prevents the completion of a data call.  |
| G               | Indicates a call terminating to a ringing station.   |
| H               | Indicates that a ringing call has been abandoned.  |
| I               | Indicates a call terminated to a busy station.   |
| J               | Indicates an incoming trunk call that is a new connection using ANF-PR (Additional Network Feature–Path Replacement, see QSIG) or DCS with Rerouting.  |
| K               | Indicates an outgoing trunk call that is a new connection using ANF-PR (Additional Network Feature–Path Replacement, see QSIG) or DCS with Rerouting.  |

If the trunk-group field `CDR Reports` is set to **ring**, CDR records the ring time to answer or abandon for incoming calls originated by the trunk group. In addition, CDR indicates if the incoming destination is busy. This record is separate from the normal call duration record printed for an answered call. This information is indicated by the condition code.

When an incoming call originated by a trunk group with this option set is terminated to an internal destination, the call is tracked from the time ringing feedback is given to the originator. If the call is answered, a CDR record is printed with the condition code "G" and the duration reflects the time between the start of ringing and the answer of the call. If the call is abandoned before being answered, the system prints a record with the condition code "H" and the duration reflects the time between the start of ringing and the time the call was abandoned. If the destination is busy, a CDR record is printed with the condition code "I" and a duration of 0.

- Condition Code overrides

If two condition codes apply to the same call, one code overrides the other. The matrix below, [Table 4-68](#), defines the overrides. To use this matrix, assume that condition codes 7 and A apply to the same call. To find the condition code that overrides, look at the point of where row 7 intersects column A (or where row A intersects column 7). In this case, condition code 7 overrides.

**Table 4-68. Condition Code Override Matrix**

|   |    | CONDITION CODE |    |    |    |    |    |    |    |    |    |    |    |    |  |
|---|----|----------------|----|----|----|----|----|----|----|----|----|----|----|----|--|
|   | 0  | 1              | 4  | 6  | 7  | 8  | 9  | A  | B  | C  | E  | F  | J  | K  |  |
| 0 | NA | 0              | 4  | 6  | 0  | NA | NA | NA | B  | C  | NA | NA | NA | NA |  |
| 1 | 0  | NA             | 4  | 6  | 1  | NA | 9  | 1  | B  | C  | E  | NA | J  | K  |  |

| K | NA | K              | K  | 6  | K  | K  | NA | NA | NA | K  | E  | F  | NA | NA |  |

- Date

You can include the date in customized records only. The format is based on the value of CDR Date Format on the CDR System Parameters form.

- Dialed Number (dialed-num) — up to 18 digits

This field contains the number dialed. If it is an outgoing call, the field contains the number dialed by a system user. If it is an incoming call, the field contains the extension that was dialed (or implied, as in Dialed Number Identification System). If more than 18 digits are dialed, the least significant digits (starting from the right) are truncated.

If CDR Privacy is active for the calling number and this is an outgoing call, the trailing digits of the dialed number are blank in the call record. If more than 18 digits are dialed, the system truncates the dialed number to 18 digits, then blanks the administered number of digits.

For an outgoing (or originating) NCA-TSC or tandem NCA-TSC, this field contains the dialed digits used to establish a route to a far-end switch. It contains the extension of the local extension used as the NCA-TSC endpoint when it is for a terminating NCA-TSC. For an unsuccessful NCA-TSC, this field is blank.

The # sign (or E for some formats) may appear in this field in the following cases for both ARS and TAC calls.

- When the user dials # at the end of digit dialing
- If an outgoing call experiences an interdigit-timeout interaction with the ARS Analysis table
- When a user dials a TAC for a Look Ahead Interflow (LAI). For example: A successful LAI to <TAC> 1001 where 1001 is the remote VDN extension will yield 1001E or 1001# in the Dialed Number field. The # or E is used by the vector processing software to indicate the end of dialing.

You can eliminate the # or E as the last digit of the CDR record using the CDR System Parameters form.

■ **Duration** (duration or sec-dur) — 4 digits

This is the duration of the call, recorded in hours (0–9), minutes (00–59), and to tenths of minutes (0–9). Calls are rounded down in 6-second increments. Therefore, a call of 5-second duration will be indicated as 0 duration. If 9999 appears in this field, this call was in progress when a time change was made in the switch.

You can use the customized record format to have the duration reported in hours/minutes/seconds. This field is called `sec_dur`.

■ **Feature Flag** (feat-flag) — 1 digit

The feature flag indicates whether a call received network answer supervision, and if the call was interworked in the network. The call duration starts at the point of receiving the network answer.

You can administer the feature flag (on the CDR System Parameters form) to reflect whether an outgoing ISDN call was reported as interworked by the network.

- A 0 in this field indicates a voice call without network answer supervision, or NCA-TSC not established.
- A 1 in this field indicates a data call without network answer supervision.
- A 2 in this field indicates a voice call with network answer supervision, but interworked.

- A 3 in this field indicates a data call with network answer supervision, but interworked.
- A 4 in this field indicates a voice call with network answer supervision.
- A 5 in this field indicates a data call with network answer supervision.

If the feature flag indicates that the call received network answer supervision, then the time of answer is accurate, and the recorded duration is also accurate. If a call does not receive network answer supervision, or receives answer supervision but is interworked with non-ISDN trunks, the time of answer is not necessarily accurate. Therefore the recorded duration for these calls may also not be entirely accurate.

Calls are considered data calls if they use a conversion resource (such as a modem) and/or originate or terminate on a data module.

■ **Format Code** — 2 digits

This field contains 2 values: 00 is no PPM; 03 denotes a PPM count in the digits record.

■ **FRL** — 1 digit

FRLs, numbered 0–7, are associated with the AAR and ARS features and define calling privileges. The information contained in this field is as follows:

- If the call is an outgoing call and an authorization code is not used to make the call, this field contains the originating voice-terminal user's FRL.
- If the call is an outgoing call and an authorization code is used to make the call, this field contains the FRL associated with the dialed authorization code.
- If the call is an incoming or tandem call, this field contains the FRL assigned to the incoming trunk group.
- If the call is an incoming tandem tie trunk call, this field contains either the FRL assigned to the tandem tie trunk or the raveling class mark (TCM) sent with the tandem tie trunk call, depending on which was used to complete the call. On ISDN calls, this field always contains the TCM, if it was received.

You can administer CDR so that disconnect information appears in this field in place of the FRL. If you do this, for trunk CDR, the following disconnect information appears:

| Data | Meaning                            |
|------|------------------------------------|
| 0    | Cannot determine who dropped first |
| 1    | Switch party dropped first         |
| 2    | CO dropped first                   |
| 3    | Maintenance seized the trunk       |

For intraswitch CDR, the following call disconnect data appears in this field in place of the FRL data:

| Data | Meaning                            |
|------|------------------------------------|
| 0    | Cannot determine who dropped first |
| 1    | Calling number dropped first       |
| 2    | Dialed number dropped first        |

- **Incoming Circuit Identification** (in-crt-id) — 3 digits

This field contains the member number of a trunk within a trunk group used for an incoming call. For outgoing calls, this field is blank. Tandem calls contain both incoming and outgoing circuit id-numbers.

The format of this field varies from record to record. For printer, Teleseer and 59-character formats, the numbers appear inverted on the record. For example, the circuit ID 123 appears as 231 (tens, units, hundreds). If you want to change this to appear in hundreds, tens, units format (123), use the `Modified Circuit ID Display` field on the CDR System Parameters form.

- **Incoming TAC** (in-trk-code) — 4 digits

This field contains the access code of the incoming trunk group.

- **INS** (3 digits)

This field specifies the ISDN Network Service requested for a call. This field applies only to ISDN calls. Each Network Specific Facility has a corresponding INS value, shown in [Table 4-69](#).

This field also appears as ISDN NSV (Network Service Value).

**Table 4-69. Network Specific Facility to INS Mapping**

| Network Specific Facility             | INS Value |
|---------------------------------------|-----------|
| OUTWATS Band 0                        | 33        |
| OUTWATS Band 1–255                    | 34–288    |
| Network Operator                      | 324       |
| Presubscribed Common Carrier Operator | 325       |
| Software Defined Network (SDN)        | 352       |
| MEGACOM 800                           | 353       |
| MEGACOM                               | 354       |
| INWATS                                | 355       |
| Maximum Banded WATS                   | 356       |
| ACCUNET Digital Service               | 357       |
| AT&T Long Distance Service            | 358       |
| International 800                     | 359       |
| Multiquest                            | 367       |

- **ISDN CC**

The call charge supplied by the ISDN advice of charge function (see [“Call Charge Information”](#) on page 4-136).

- **ISDN NSV**

See INS.

- **IXC Code**

- Non-ISDN Formats — 1 digit hexadecimal

Interexchange Carrier (IXC) codes, 1–F hexadecimal, indicate the carrier used on the call. This information is sent to the CDR output device in ASCII code as a hexadecimal representation (for example, ASCII “F” equals “15”).

Users must dial an IXC access number to access a specific common carrier for a call. In the US, this number is in the form 10XXX, 950 — 1XXX, or any 8–11 digit number. The IXC access numbers applicable at a given location are associated with an IXC code on the Inter-Exchange Carrier Codes form.

When ARS is used, and a route pattern inserts one of the administered IXC codes, the report contains the associated IXC code. If no IXC access number is used, or the carrier is selected at the CO, the report contains a 0.

— ISDN formats — 3 or 4 digits

With an ISDN record format, this field is a 3 or 4-digit field that identifies the actual IXC used on an ISDN call. This information is determined from the route pattern administration. For AAR and ARS calls, the 3-digit IXC value is administered in the route pattern for all ISDN calls. If a user dials an IXC code with a 10XXX format as administered on the Inter-Exchange Carrier Codes form, the CDR record contains only the last 3 digits (4 for Enhanced). If a user dials a 7-digit IXC code, this field contains a 0.

■ **Line Feed** — 1 character

The ASCII line feed character follows a carriage return to terminate CDR records.

■ **MA-UUI** — 1 digit

Message Associated User-to-User Signaling shows the number of ISDN messages containing user data sent on an outgoing call. Data in this field can range from 0 to 9.

■ **Node Number** (node-num) — 2 digits

This field identifies the DCS node number of a switch within a DCS arrangement. The number output is the same as the node number on the Dial Plan form (the local id).

■ **Null** — 1 character

The NULL is used to terminate and divide CDR Records (usually in triplets) when needed by the receiving adjunct.

■ **Outgoing Circuit Identification** (out-crt-id) — 3 digits

For outgoing calls, this field contains the member number of the trunk within a trunk group used. This field is blank for incoming calls. Tandem calls include both incoming and outgoing circuit id numbers. For outgoing and tandem NCA-TSCs, this field contains the signaling group used to carry the NCA-TSC.

The format of this field varies from record to record. For printer, Teleseer and 59-character formats, and the ISDN and enhanced forms of those records, the numbers appear inverted on the record. For example, the circuit ID 123 appears as 231 (tens, units, hundreds). If you want to

change this to appear in hundreds, tens, units format (123), use the Modified Circuit ID Display field on the CDR System Parameters form.

- **Packet Count** (tsc\_ct) — 4 digits

For ISDN TSCs, this field contains the number of ISDN-PRI USER INFO messages sent, received, or (for tandem TSCs) passing through the switch.

- **PPM**

Periodic Pulse Metering (PPM) contains pulse counts transmitted over the trunk line from the serving CO. These are used to determine call charges.

- **Resource Flag** (res\_flag) — 1 digit

Indicates whether the call was circuit switched or packet switched, whether a conversion resource was used, or if the call involved a MASI terminal or trunk.

- 0 — circuit switched, no conversion device used
- 1 — packet switched, no conversion device used
- 2 — circuit switched, conversion device used
- 3 — packet switched, conversion device used
- 8 — MASI call

- **Sec-dur**

For customized records only, this field allows you to set the duration field to display seconds instead of tenths of minutes.

- **Space** — up to 40 characters

The ASCII space character separates other CDR fields or fills unused record locations.

- **TSC-Count** (tsc\_ct)

This is the customized name for Packet Count. See Packet Count.

- **TSC Flag** (tsc\_flag) — 1 digit

This field describes call records that pertain to temporary signalling connections. When not equal to 0, this field will indicate the status of the TSC. [Table 4-70](#) presents the TSC Flag encoding.

**Table 4-70. Encoding for TSC Flag**

| Encoding | Meaning   |
|----------|---|
| 0        | Circuit-switched call without TSC requests  |
| 1–3      | Reserved  |
| 4        | Call Associated TSC requested and accepted in response to SETUP, no congestion control (applicable to originating node). Call Associated TSC received and accepted via SETUP, no congestion control (applicable to terminating node). |
| 5        | Call Associated TSC received and accepted via SETUP, congestion control (applicable to terminating node).   |
| 6        | Call Associated TSC requested, accepted after SETUP, no congestion control (applicable to originating node). Call Associated TSC received and accepted after SETUP, no congestion control (applicable to terminating node).           |
| 7        | Call Associated TSC received and accepted after SETUP, congestion control (applicable to terminating node).   |
| 8        | Call Associated TSC requested, rejected (rejection came from outside the local switch).   |
| 9        | Call Associated TSC requested, rejected (rejection came from the local switch, that is, lack of resource).  |
| A        | Non Call Associated TSC received, accepted, no congestion control (applicable to terminating node). Non Call Associated TSC received, accepted, no congestion control (applicable to terminating node).                               |
| B        | Non Call Associated TSC requested, accepted, congestion control (applicable to originating node). Non Call Associated TSC received, accepted, congestion control (applicable to terminating node).                                    |
| C        | Non Call Associated TSC requested, rejected (rejection came from outside the local switch).   |
| D        | Non Call Associated TSC requested, rejected (rejection came from the local switch, that is, lack of resource).  |
| E        | Reserved for future use.  |
| F        | Reserved for future use.  |

- **Time**

This field contains the time that the call ended, or the time that a user dropped from a multi-party call, if Call Splitting is active.

- **VDN (vdn) — 5 digits**

This field is only available on customized records. The call record contains the VDN extension number. If VDN Return Destination is active, this field contains the first VDN the caller accessed.

## Security

Monitor call detail records daily for unusual calling patterns, long calls, international calls, calls outside of normal business hours, and other indications of toll fraud. Call accounting systems are available that automatically monitor CDR output for fraudulent calling patterns.

## Considerations

- **Date and Time**

If a time of day is not administered in the system, DEFINITY ECS does not generate CDR records. If the time is changed while a call is in progress, the actual duration for that call is not reflected in the CDR record. Instead, a special sequence of 9999 is recorded in the CDR record to indicate that the call was in progress during a time change.

## Interactions

- **Abbreviated Dialing**

When a user places a call using Abbreviated Dialing or a Facility Busy Indication button, all outpulsed digits appear on the record.

- **Answer Detection**

The DEFINITY ECS provides Answer Detection using a Call Classifier circuit pack. This feature is assigned as an option per system and requires 8-port circuit packs. The circuit packs must be engineered to handle the expected outgoing calls from end of outpulsing until either answer is detected by the circuit pack or actual Answer Supervision is received from the trunk. The time the answer is detected by the circuit pack is used as the start of a call to record call duration in the CDR record.

- **Attendant Console**

If an attendant-assisted call involves an outgoing trunk, the primary extension of the voice-terminal user requesting attendant service is recorded as the calling number, even if the attendant dialed the outside number. Condition Code 1 indicates the call was assisted by the attendant.

If the attendant allows through dialing, the primary extension of the voice-terminal user who dialed the number is recorded as the calling party. Condition Code 1 indicates that a trunk access code was extended by the attendant. Condition Code 7 indicates that a feature access code was extended by the attendant.

If Incoming or Outgoing Attendant Call Record is enabled, the system produces a separate record for the attendant portion of incoming or outgoing calls that are transferred.

On attendant-assisted calls that require an account code, the account code must be entered before the trunk access code.

If the attendant is redirecting an incoming call to a voice terminal, the attendant may dial an account code before dialing the extension number.

It is not possible to option the attendant for intraswitch calls. Intraswitch records are produced for an intraswitch-optioned extension calling the attendant or for a call from the attendant to an intraswitch-optioned extension. In the case of an attendant-assisted call involving an intraswitch extension, the calling number recorded is the extension of the party who called the attendant, and the dialed number recorded is the extension that the attendant extended the call to. The record has a Condition Code 0.

- AUDIX

For remote AUDIX over DCS, if station A on node 1 forwards its calls to AUDIX on node 2, each switch produces a call record. The record from node 1 contains A as the dialed number. The record from node 2 contains AUDIX as the dialed number. If the calling number is on a different switch within the DCS network, or the call comes in over ISDN, the actual calling number is recorded in the `Calling Number` field, and the TAC of the trunk bringing the call into the local switch is recorded in the `Incoming Trunk Access Code` field of 24-word records. If the forwarded call is an incoming call, then, as in all cases (other than vectoring) in which an incoming call is forwarded, transferred, or conferenced using an outgoing trunk, two separate CDR records are produced, one for incoming and one for outgoing trunk usage. The outgoing trunk usage record lists AUDIX as the `Calling Number`.

- Authorization Codes

Authorization codes are recorded on CDR records if account codes do not exceed 5 digits for both non-ISDN and ISDN LSU formats and 4 digits for Enhanced LSU formats. On the 59-character CDR International Processing and International Direct records, the authorization code is never recorded. When account codes are dialed, for the non-ISDN and the ISDN LSU formats, authorization codes are recorded on CDR printouts if the account code length does not exceed 6 digits. For Enhanced LSU, the account code length must not exceed 6 digits.

- AAR and ARS

CDR records contain the following information for Automatic Route Selection (ARS):

- Fact that an ARS call was made
- Calling extension number
- FRL of the calling extension
- Called number
- TAC of trunk group used for the ARS call
- Time of call completion
- Call duration (how long the parties talked)
- IXC code, if any

If CDR is suppressed for the trunk group actually used on an ARS call, a CDR record is not generated; otherwise, Condition Code 7 applies. The ARS access code is recorded in the `Access Code Dialed` field and the trunk access code for the trunk group actually used is recorded in the `Access Code Used` field.

If an AAR call is placed to a busy trunk group and CDR is suppressed for that trunk group, the user hears reorder tone and the CDR output shows an ineffective call attempt.

If an ARS call is an attendant-assisted call, the CDR record shows the call with a Condition Code of 7 (ARS call) instead of a Condition Code of 1 (attendant-assisted call). This occurs because CDR is not notified until after the trunk is seized and, in this case, the trunk is not seized until the voice-terminal user dials the number.

For FEAC, if a trunk group is accessed via ARS, the trunk group's COR is not used to determine if an account code needs to be entered.

- Automatic Callback

When the Automatic Callback feature is used for an intraswitch call, no CDR record is generated for the first call attempt or the ringback. However, if the caller or extension being called is optioned for intraswitch CDR, a record of the actual call is output provided the call is answered and completed.

- Automatic Circuit Assurance

ACA calls generate intraswitch CDR if the terminating extension is monitored by CDR. The originating extension for ACA calls cannot be administered for intraswitch monitoring.

- Automatic Wakeup

No CDR intraswitch records are generated for wakeup calls.

- Bridged Call Appearance

CDR does not record any information on the party who bridges onto a call. Instead, the number that was called appears in the `Dialed Number` field of the CDR record. The duration of the call is recorded when the last party drops off the call. This also applies for intraswitch calls.

If the user originates a call over a bridged appearance, the call record contains the calling number of the bridged appearance extension and not the extension number of the original, calling station.

- Busy Verification of Terminals and Trunks

An attendant or voice-terminal user is never required to enter an account code when making a busy verification.

- Call-by-Call Service Selection

When a successful call is made on a Call-by-Call Service Selection trunk, the network specific facility used on the call is translated into an `INS` number and recorded in the `INS` field of the call record. If a Call-by-Call Service Selection call is unsuccessful because of an administered trunk usage allocation plan, the `INS` number is recorded in the `INS` field of the report with a condition code of "E."

- Call Coverage

When an incoming or intraswitch call is answered by a covering voice terminal, the extension number dialed by the originating party is recorded as the dialed number. If a call is covered to an off-net location, the dialed number is the number of the off-net location, the calling number is the number of the station that is covered to the remote location.

- Call Forwarding All Calls

When a call is forwarded to another voice terminal, the extension number dialed by the calling party is recorded as the dialed number. If a call is forwarded to an off-net location, the dialed number is the number of the off-net location, the calling number is the number of the station that is forwarded to the remote location.

CDR generates one record for a forwarded intraswitch call. In this record, the dialed number is the same as the extension dialed by the originating party.

For a trunk call to a station that is forwarded to a trunk, CDR generates two records. The first record shows an incoming trunk call to the station. The second record shows an outgoing trunk call from the station.

For FEAC, calls cannot be forwarded to a destination where a user is required to enter an account code.

- Call Park

When a voice-terminal user parks an incoming or intraswitch call, that user's extension is recorded as the dialed number in the CDR record. Call duration in CDR reflects the entire time the incoming trunk is busy (incoming) or until the call ends (intraswitch).

- Call Pickup

When an incoming or intraswitch call is answered by another voice-terminal user in the pickup group, the extension number dialed by the calling party is recorded as the dialed number.

- Call Vectoring

The CDR System Parameters form can be administered so that the VDN extension is used in place of the Hunt Group or Member extension. If administered to do so, this overrides the *Calls to Hunt Group - Record* option of CDR for incoming Call Vectoring calls.

Outgoing vector calls generate ordinary outgoing CDR records with the originating extension as the calling number.

For incoming calls to a VDN, the duration of the call is recorded from the time answer supervision is returned.

- If answer supervision is returned by the vector (via an announcement, collect, disconnect, or wait with music command), and the call never goes to another extension, the VDN extension is recorded as the called number in the CDR record.
- If the call terminates to a hunt group, the VDN, hunt group, or agent extension is recorded as the called number as per the administration discussed above.
- If the call terminates to a trunk, CDR generates the following two records:
  - An incoming record with the incoming TAC as the dialed number.
  - An outgoing record with the incoming TAC as the calling number and the digits dialed through the vector step as the dialed number.

If "member extensions" is administered on the CDR System Parameters form and the call successfully completes to a station via the "route-to" command, the call record shows an incoming call to that station.

Call Vectoring "route to" commands that are unsuccessful do not generate ineffective call attempt records.

If a vector interacts with an extension or group that has Call Forwarding All Calls active, normal Call Forwarding/CDR interactions apply.

Some calls may originally look like intraswitch calls, but result in trunk calls (for example, a call from a station administered for intraswitch CDR to a VDN, which ends up an outgoing call on an outgoing trunk). Such calls will not generate intraswitch CDR records; the CDR record will have a condition code A - outgoing.

- Call Waiting Termination

Call duration timing starts when the voice terminal answers an incoming call.

- Centralized Attendant Services

If a CAS attendant extends a call for a user, and CDR is not assigned to the RLT trunk group, the user's extension is recorded as the originator of the call. If the RLT trunk group does have CDR administered, the RLT trunk is recorded. If a CAS attendant answers a call but does not extend the call, no CDR records are made.

- CO Trunks

All incoming and outgoing calls on a CO trunk group are recorded, if CDR is assigned to the trunk group and CDR is administered to record incoming calls.

- Conference

For the purpose of CDR, a call is considered a conference call if it contains at least one trunk that is eligible for CDR plus two or more parties, or if it contains at least one party optioned for intraswitch CDR. Condition Code C applies to each CDR record made for a conference call.

For a conference call, a separate CDR record is produced for each outgoing/incoming trunk serving the conference call. If ITCS or OTCS is enabled, CDR produces a separate record for each internal party on the call as well.

For the outgoing portion of a conference call involving multiple voice terminals, the voice terminal which requested outside dial tone to bring an outside party into the conference is recorded as the calling party.

For the outgoing/incoming portion of a conference call, the call duration in CDR reflects the entire time the trunk is on the conference call.

A separate CDR record is produced for each trunk used in a trunk-to-trunk transfer. If ITCS is active, the incoming trunk record shows the duration of the entire call.

If the originator of the conference call is optioned for intraswitch CDR, each time the originator dials a non-trunk party, a new CDR record is started. For example, Station A is optioned for intraswitch CDR and calls Station B. Station A conferences in Station C. Station A drops from the call. Station B or C drops from the call. Two CDR records are output with Condition Code C: one for the A to B call and one for the A to C call.

If the originator is not optioned for intraswitch CDR, but one or more parties brought into the conference are, one record with Condition Code C is generated for each dialed intraswitch party. For example, Station A calls Station B, which is optioned for intraswitch CDR. Station A conferences Station C. Station A drops from the call. Station B or C drops from the call. One CDR record is output with condition code C for the A to B call.

Intraswitch conference call CDR records are output when both the calling number (originator) and dialed number (terminator) of the call drop. The duration of the call will be from the time the terminator answers until both the originator and terminator drop from the call.

If the attendant originates the conference, only the dialed numbers corresponding to intraswitch optioned extensions stimulate the creation of CDR records.

- DCS

Station information is not passed throughout the DCS network for CDR purposes.

- DID trunks

All incoming calls on the DID trunk group will be recorded if administered to record incoming CDR and if CDR is administered for this trunk group.

- Emergency Access to the Attendant

CDR does not generate intraswitch records for Emergency Access calls.

- Expert Agent Selection

A logical extension can be assigned to an agent who can log into a phone using that extension number. On the CDR System Parameters form, you can choose to record the logical agent's extension rather than the hunt-group extension or hunt-group-member extension.

- FX Trunks

All calls made on an FX trunk group are recorded if administered to record CDR and if CDR is administered for this trunk group.

- Hotline Service

The stored number used on an outgoing or intraswitch Hotline call is recorded by CDR the same as if it was manually dialed.

- Hunt Groups

Either the hunt group extension number or individual hunt group member extension number is recorded as the called number. This is administrable on the CDR System Parameters form.

- Intercept Treatment

If an outgoing or tandem call is routed to Intercept Treatment, the number dialed by the calling party is recorded as the dialed number, and Condition Code F is recorded.

- Intercom — Automatic  
Intercom calls can generate intraswitch CDR records.
- Intercom — Dial  
Intercom calls can generate intraswitch CDR records.
- Inter-PBX Attendant Calls  
If a user calls an Inter-PBX attendant and the trunk group used has CDR assigned, call records contain the following information:
  - Condition Code — A
  - Access Code Dialed — Blank
  - Access Code Used — Trunk access code of trunk used
  - Dialed Digits — Inter-PBX attendant access code
- ISDN  
When true answer supervision is received from the network, an indication is sent to the CDR device to this effect. If an ISDN call has been interworked, the call record shows this, and answer supervision may or may not be accurate. If you use unformatted or expanded record formats, the SID/ANI appears in the record, if sent.
- Last Number Dialed  
The CDR access code and account code dialed are stored as part of the Last Number Dialed. However, some digits may be lost due to the limit on the number of digits stored for this feature.
- Manual Originating Line Service  
If an attendant establishes an outgoing call for a voice terminal, designated as a Manual Originating Line, the CDR record for the call is the same as for any attendant-assisted outgoing call. The calling voice terminal extension number is recorded as the calling number, and Condition Code 1 applies.
- Multiple LDNs  
If incoming call information is recorded, the called number recorded for LDN calls is the extension number or trunk group access code to which the attendant completes the call. If the call terminates at the attendant console only, the dialed number is the attendant extension. The attendant extension number is administrable (the default is 0).  
  
LDNs cannot be administered for intraswitch CDR. However, a call from an intraswitch optioned extension to a LDN produces an intraswitch CDR.
- Night Service  
The extension number assigned to the attendants is recorded as the dialed number. The attendant extension number is administrable (the default is 0).

- Off-Premises Station

CDR data is recorded if the voice terminal is involved in an outgoing/incoming trunk call or it (or the other terminal involved in the call) is optioned for intraswitch CDR.
- PCOL trunks

An outgoing PCOL call shows the dialed number in the `Dialed Number` field of the CDR record rather than a TAC. An outgoing PCOL call is recorded as a call from the originating extension number via the trunk group associated with the PCOL. On incoming PCOL calls the answering voice terminal's primary extension is recorded as the called number if incoming calls are recorded.
- Planned Interchange

When a planned interchange occurs (either demand or scheduled), it is possible for the CDR records on calls ending within 10–20 seconds after the interchange to report as “invalid long duration calls” (duration of 9:59:9 and Condition Code other than 4). This is caused by deviations in the clocks between the two processors and the short duration of the calls. Consider these records invalid.
- Private Network Access

Private Network Access calls are recorded if CDR is assigned for incoming or outgoing tie trunks.
- Remote Access

Remote Access calls are recorded if Remote Access is provided on a per trunk group basis, and those trunks are administered for CDR. The call record gives no indication that this is a remote access call, other than the remote access extension.
- Ringback Queuing

Condition Code 8 is recorded for an outgoing call which is queued for a trunk before completion. The length of time the call is queued is not recorded.

When an outgoing call is queued for a trunk and is unsuccessful (the queue times out or the calling party does not answer the callback) a CDR record is not generated for the call.
- Security Violation Notification

SVN calls generate intraswitch CDR if the terminating extension is monitored. You cannot administer the originating extension for intraswitch monitoring.
- Service Observing

No CDR records are generated for Service Observing calls. Tandem Tie-Trunk Switching

The calling party on an incoming trunk can dial the CDR account code. The `Calling Number` field in CDR is the trunk access code for the incoming trunk group, the called number is the number dialed.

- Temporary Bridged Appearance

A CDR record is not affected by any second or subsequent voice terminal bridging a call.

- Temporary Signaling Connections

Cal-associated TSCs and TSC requests appear in the call record, provided the switch is administered to use ISDN layouts.

Non-call-associated TSCs and TSC requests generate separate CDR records if the switch is administered to record them. In either case, the `TSC Flag` and `Packet Count` fields of the call record contain TSC data.

- Tie Trunk Access

Tie-trunk calls are recorded if CDR is administered to record the trunk group and to record incoming calls.

- Transfer

If a user *originates* a call on an outgoing trunk and then transfers the call to another voice terminal, the originating voice terminal is recorded as the calling party.

If a voice-terminal user *receives* a call on an incoming trunk and then transfers the call to another extension, the extension that originally received the call is recorded as the dialed number.

If a voice-terminal user *receives an intraswitch call* and then transfers it to another extension, the extension that originally received the call is recorded as the dialed number.

If call splitting is active, when a user receives or originates a trunk call and then transfers the call to another voice terminal, two records are generated.

Intraswitch CDR records are generated for each call to or from an intraswitch optioned extension. For example, Station A, which is intraswitch optioned, calls Station B. Station A then transfers the call to Station C. When either Station B or C drops, two CDR records with Condition Code 0 are output: one for the A to B call, and the second for the A to C call.

Intraswitch CDR transfer records are output when both the calling number (originator) and dialed number (terminator) drop from the call. The duration of the call is from the time the terminator answers until both the originator and terminator have dropped from the call.

If ITCS is enabled and an incoming trunk call is transferred to a local extension that is optioned for Intraswitch CDR, the call produces an incoming trunk call record. It does not produce an Intraswitch record.

Voice-terminal users cannot dial an account code when transferring a call to another voice terminal, unless they have console permissions. However, a voice-terminal user transferring a call to a trunk can dial an account code before dialing the ARS or TAC.

- Trunk-to-Trunk Transfer

Although they are not really conference calls, Trunk-to-Trunk Transfer connections are treated as such for CDR purposes. A separate CDR record is generated for each trunk in the connection.

Unanswered Trunk Calls may or may not be recorded depending on administration. Each trunk group can be administered so that unanswered calls will be recorded if they remain unanswered for a specified period of time.

If Incoming Trunk Call Splitting is active, a trunk-to-trunk transfer produces a record of the incoming call, and a record of the outgoing call. The outgoing call record shows the duration from the time the call was transferred until both parties drop. The incoming call record shows the duration from the time the station receives the incoming trunk call until both parties drop.

- Uniform Dial Plan

If one user calls another user via a UDP extension number, and the trunk group used has CDR assigned, CDR records the following information:

- Condition Code — 7
- Access Code Dialed — blank
- Access Code Used — trunk access code of trunk used
- Dialed Digits — Uniform Dial Plan extension

- VDN Return Destination

An incoming call does not generate a CDR record until the originator drops from the call. CDR creates a record when a call goes to the return destination VDN, the originator has not dropped, and vector processing — that is, the return destination VDN — routes the call to an outgoing trunk. CDR does not create a record if vector processing routes a call from the return destination VDN to an internal call. The call record shows only the first VDN that the caller accessed, no matter how many other extensions are involved in the call.

If an incoming VDN call is routed to a station, CDR includes the station in the record. If an incoming VDN call is routed to an outgoing trunk, CDR includes the VDN in the record.

- WATS and 800 Service

Calls made on a WATS or 800 Service trunk group are recorded, if CDR is administered for the trunk group.

## Call Forwarding

---

Call Forwarding allows users to redirect calls to designated destinations. The forwarded-to destination can be an internal extension, external (off-net) number, an attendant group, or a specific attendant.

Call Forwarding provides five functions:

- Call Forwarding-All Calls — Allows a user to redirect every incoming call to the forwarded-to destination.
- Call Forward Busy/Don't Answer — Allows a user to redirect incoming calls to a forwarded-to destination only when the user is busy or when the call is not answered after an administrable interval. If the extension is busy, the call forwards immediately. If the extension is not busy, the incoming call rings the called extension, then forwards only if it remains unanswered longer than the administered interval.
- Call Forwarding Off Net— Allows a user to forward calls to an off-net destination.
- When Coverage of Calls Redirected Off-Net is activated, calls can be monitored for call progress tones, and if a call is not answered, it is returned to the switch for call coverage processing in some circumstances.
- Call Forwarding Override — Allows the user at the forwarded-to extension to override Call Forwarding at the forwarded-from extension on a per-call basis so the user can initiate a call or transfer a call back to the forwarded-from extension.

## How to administer Call Forwarding

---

### Required forms

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|

1. Call Forwarding Override only
  2. Call Forwarding Off Net only
  3. Call Forwarding Busy/Don't Answer only
  4. Call Forwarding All Calls only
- 

**Detailed description**

You assign Call Forwarding All Calls and Call Forwarding Busy/Don't Answer to extensions on a Class of Service basis. You assign Call Forwarding Override and Call Forwarding Off-Net on a system-wide basis. You can also restrict Call Forwarding Off-Net with the Class of Service.

**Call Forwarding All Calls**

Voice-terminal users and data-terminal users can activate or deactivate Call Forwarding All Calls for their own terminals with a feature-access code or Call Forward-All feature button. An attendant or voice-terminal user with console permission can activate or deactivate the feature for another extension, TEG, DDC, UCD group, or ACD split (but not vector-controlled splits).

**Call Forwarding Busy/Don't Answer**

The feature is activated or deactivated with a feature-access code or Call Forward Busy/Don't Answer feature button. An attendant or voice terminal with console permission can also activate or deactivate the feature for another extension by using a feature-access code.

Call Forward Busy/Don't Answer cannot be activated for hunt groups, data extensions, or terminating extension groups (TEG). Calls to an attendant or EAS agent cannot be forwarded.

## Call Forwarding Off Net

If Coverage of Calls Redirected Off-Net on the System Parameters Customer-Options form and Coverage of Calls Redirected Off-Net Enabled on the Feature-Related System Parameters form are both set to **y**, the system allows calls forwarded off-net to be monitored for busy or no-answer conditions. The system may bring the call back for call-coverage processing if the principal's coverage criteria are satisfied at the forwarded-to destination. However, if the principal does not have a coverage path, the system does not monitor the call. It is left at the off-net destination regardless of whether it is answered or busy.

If the principal has Send All Calls active, the system does not attempt Call Forwarding Off-Net, except for priority calls. Likewise, the system does not attempt Call Forwarding Off-Net for coverage paths that specify Cover All, except for priority calls.

### NOTE:

Using Call Forwarding Off Net outside the US requires the OCM call classification form.

## Call Forwarding — Override

You can administer Call Forwarding Override on a system-wide basis to allow a forwarded-to party to override Call Forwarding when placing a call to the forwarded-from party. Call Forwarding Override is invoked automatically if the system-wide override option is set.

Call Forwarding Override cannot be used when calls forward to an external number. Call Forwarding All Calls from a data user or a hunt group cannot be overridden with Call Forwarding Override.

## End-user procedures

Voice terminal users activate Call Forwarding All Calls and Call Forward Busy/Don't Answer either by dialing a feature-access code or pressing a feature button and then dialing the forwarded-to destination number. They must press either the Call Forwarding All Calls button or the Call Forward Busy/Don't Answer button, as appropriate. They can deactivate the feature by dialing the appropriate feature-access code or by pressing the feature button again.

Voice-terminal users with console permission and attendants can activate Call Forwarding All Calls for another user by dialing a feature access code, followed by the forwarding-from extension and then the forwarded-to extension. They

deactivate the feature by dialing the appropriate feature access code, followed by the extension for which the feature is to be canceled.

## Security

---

Use the **list call-forwarding** command to identify unauthorized Call Forwarding feature activation. The list shows the station name, station number, and forwarded-to destination number.

### SECURITY ALERT:

*Users who do not have permission to call out of the building may not do so with Call Forwarding.*

## Considerations

---

Calls can be forwarded only once. Consider the following scenario. Extension A forwards its calls to extension B. Extension B forwards its calls to extension C. Calls made to extension A:

- Ring at A, if possible
- Ring at B, if possible
- Redirect to extension A's coverage path, if available and A's coverage criteria are satisfied when applied to B
- Return busy tone to the calling party
- Are not forwarded to extension C

There is no maximum number of calls that can be forwarded simultaneously.

You can administer a terminal to receive a redirection notification signal when a call is forwarded.

The system restricts users from forwarding calls to a number that they are not allowed to call.

If **save translation** is run after call forwarding is activated for a terminal, forwarding is saved to tape.

## Attendant

The attendant cannot have a Call Forwarding button.

Only the attendant or voice-terminal user with console permission can activate Call Forwarding All Calls for TEG, UCD groups, and DDC.

Calls to attendants cannot be forwarded. However, calls can be forwarded to the attendant *group*.

Only the attendant, or a station with console permissions, can activate Call Forwarding All Calls for a data module.

## Off net

If call on an incoming trunk is forwarded to an off-net number, any other calls on and incoming trunk to the same extension within the next 30 seconds receive busy tone or redirect to coverage if Send All Calls is assigned. This prevents the first call from forwarding back from a remote device and then being forwarded again, thus ultimately using all available trunks.

When a call is forwarded off net, the forwarded-to number can have up to 16 digits. When counting the 16-digit limit, count the TAC or ARS feature access code (usually a "9"). Do not count the "#" used to terminate a forwarded-to number.

Calls forwarding off net require an available outgoing trunk. Additionally, when Coverage of Calls Redirected Off-Net is enabled, a call-classifier port must be available. If there are no call-classifier ports available, the call still routes off net, but it is not monitored for call progress tones and cannot be returned to the switch for further call coverage processing.

In some instances more than one call classifier may be monitoring an off net (coverage/forwarding) call. If the call is answered and for some reason one of the call classifiers fails to detect the answer, the call may be disconnected and redirected to further coverage treatment.

The list measurement tone-receiver traffic reports provide port usage for this feature.

## Interactions

---

- Answer Detection

This feature shares call-classifier resources with the Coverage of Calls Redirected Off-Net feature.

- Attendant Override of Diversion Features

If an attendant uses redirection override to call a user who has Call Forwarding active, the call does not forward and remains at the user's voice terminal.

- Automatic Callback and Ringback Queuing

Automatic Callback cannot be activated toward a voice terminal that has Call Forwarding active. If Automatic Callback was activated first, the callback call attempt is redirected to the forwarded-to party.

- Bridging

Calls do not terminate to bridged appearances when Call Forward Busy/Don't Answer is active.

The switch blocks users from bridging onto a call that has routed off net while the call is undergoing call classification.

- Call Coverage

If the principal's (forwarding extension) redirection criteria are met at the designated (forwarded-to) destination, the forwarded call redirects to the principal's coverage path; the designated destination gets a temporary bridged appearance (except when it is off net), which remains active after the call is answered so that the designated extension can bridge onto the call if desired. The temporary bridge appearance remains until the caller hangs up.

If Cover All Calls is part of the coverage redirection criteria and if Call Forwarding or Call Forwarding Off-Net is active at a voice terminal, incoming priority calls forward to the designated destination; all other calls redirect according to the Call Coverage path. Non-priority calls are not directed off net.

When a covering user has activated Call Forwarding, a coverage redirected call does not forward to the designated extension number. Instead, the call is redirected to the next point in the principal's coverage path, if available. If no other coverage point is available, the call remains at the principal's voice terminal.

- Call Detail Recording

When a call is forwarded to an off-net number, the call is recorded in CDR records as a call from the forwarding station. When *Coverage of Calls Redirected Off-Net* is enabled, a CDR record is generated only after the call has actually been answered off net.

If forced entry of account codes is required, calls cannot be forwarded to off-net destinations.

- Call Forwarding All Calls and Call Forward Busy/Don't Answer

Call Forwarding All Calls and Call Forward Busy/Don't Answer cannot be active for the same terminal at the same time.

- Call Park

Calls can be parked on a forwarded-from extension even though Call Forwarding is active for that extension. If a forwarded-to extension user parks a call that had been forwarded to that extension, the call is normally parked on the forwarded-to extension, not the forwarded-from extension.

- Call Pickup/Directed Call Pickup

If the *Temporary Bridged Appearance* on *Call Pickup* field is set to **y** on the *Feature-Related System Parameters* form, a *Temporary Bridged Appearance* is maintained if the forwarded-to destination is a

member of the same call pickup group as that of the forwarded from station. If the Temporary Bridged Appearance on Call Pickup field is set to n, a Temporary Bridged Appearance is not maintained.

- Call Prompting

This feature shares call-classifier resources with the Coverage of Calls Redirected Off-Net feature.

- Call Visor ASAI

This feature shares call-classifier resources with the Coverage of Calls Redirected Off-Net feature.

- Conference

The switch blocks users from conferencing another party onto a call which has routed off net while the call is undergoing call classification. If any party on a call that has forwarded off net is on hold (due to the initiation of a conference), the call routes off net without undergoing call classification. This occurs even when Coverage of Calls Redirected Off-Net is enabled.

- Direct Inward Dialing

If an incoming DID call is forwarded to an external (off-net) number, any other incoming DID calls to the same DID extension within the next 30 seconds receive busy tone or redirect to coverage, if assigned.

- Expert Agent Selection

Agents logged in with EAS enabled cannot activate or deactivate Call Forwarding. The physical extension where the EAS agent is logged in can be forwarded, but the EAS agent must first log out. Then, the phone can be forwarded.

- Hold

If any party is on hold when a forwarded-to call routes off net, that call does not undergo call classification, even when Coverage of Calls Redirected Off-Net is enabled.

- Hot Line Service and Manual Originating Line Service

Voice terminals assigned these features cannot activate Call Forwarding. However, calls can be forwarded to these terminals. Other users can activate Call Forwarding for the hotline terminal.

- Interflow

The Interflow feature allows ACD calls to be redirected from one split to a split on another switch or to another external location. This is accomplished by forwarding calls that are directed to the split extension to an off-notify-net location via the Call Forwarding All Calls feature.

- Intraflow

Call forwarding can be used to unconditionally redirect ACD calls from a split to another destination on the same switch.

- Leave Word Calling

LWC cannot be activated toward a voice terminal that has Call Forwarding activated. If LWC was activated before the called voice-terminal user activated Call Forwarding, the callback call attempt is redirected to the forwarded-to party.

- MFC Signaling

This feature shares call classification resources with the *Coverage of Calls Redirected Off-Net* feature.

- Personal Central Office Line

PCOL calls cannot be forwarded.

- QSIG

If a call is forwarded over an ISDN-PRI trunk administered with supplementary service protocol "b" (QSIG), then additional call information may be displayed. See ["QSIG" on page 12-77](#) for more information.

- Send All Calls

If an extension has both Send All Calls and Call Forwarding All Calls activated, calls to that extension that can immediately be redirected to coverage are redirected. However, other calls, such as Priority Calls, are forwarded to the designated extension.

Activation of Send All Calls at the forwarded-to extension does not affect calls forwarded to that extension.

- Temporary Bridged Appearance

The system maintains a Temporary Bridged Appearance for on-net calls after the call is answered or until the caller hangs up. However, for calls forwarded off-net, the system cannot maintain a Temporary Bridged Appearance. Once the call is redirected to the principal's coverage path, the trunk to the off-net, forwarded-to, number is released.

- Transfer

The switch blocks a user from transferring a call which has routed off net to another party while the call is undergoing call classification. If any party on a call that has routed off net is on hold (due to the initiation of a transfer), the call routes off net without undergoing call classification. This occurs even when *Coverage of Calls Redirected Off-Net* is enabled.

## Call Park

---

Call Park allows users to put a call on hold and then retrieve the call from any other voice terminal within the system.

| Console-Parameters                | ■ Common Shared Extensions<br>— all fields          | <a href="#">5-86</a>  |

### Detailed description

---

You can set a system-wide expiration interval for parked calls. If a call is not answered within the interval, the parked call redirects to an attendant or to the user who activated Call Park (the parking user). Calls redirect to the attendant if the default “Loudspeaker Paging” option is assigned and to the parking user if the *Deluxe Paging and Call Park Timeout to Originator* option is assigned.

If no attendant or night service extension is administered, and if *Night Service — Trunk Answer from Any Station* is not administered, the expiration interval is ignored and the call remains parked.

If two parties are connected on a parked call, a third party can also answer the call before the interval expires, creating a 3-way conference.

The attendant console group can have common, shared extensions used exclusively for Call Park. These extensions are not assigned to a voice terminal, but are stored in system translations and used to park a call. The extensions are particularly useful when one party is paged at the request of another party. The caller is parked on a common shared extension and the extension is announced. The status lamp associated with the extension identifies “call parked” or “no call parked” (instead of active or idle status).

Call Park allows voice-terminal users to answer a call at one extension, but complete the call at another extension. Call Park also allows users to answer a call at any terminal after being paged by a voice-terminal user or an attendant.

## End-user procedures

---

Call Park can be activated by any of the following:

- Single-line voice-terminal user — Flash the switchhook, dial the Call Park access code, and hang up.
- Multiappearance voice-terminal user — Press the Transfer or Conference button, dial the Call Park access code, and press Transfer or Conference again to keep the parking station on the call until they hang up. You can also park the station by simply pressing the Call Park button (if assigned).
- Attendant — Press Start, dial the Call Park access code followed by any extension, and press Release or use the Direct Extension Selection With Busy Lamp Field feature instead of dialing the extension.

Retrieve parked calls by dialing the Answer Back access code and the extension where the call was parked. Or press the same Call Park button used to park the call.

## Considerations

---

- Only one call per extension can be parked at a time, even if the extension has multiple call appearances. However, a conference call with five parties can be parked. The sixth conferee is the retrieving party.
- Calls cannot be parked on a group extension. If a group member places a call in Call Park, the call is parked on the member's extension. Group members can belong to the following:
  - A coverage answer group
  - A DDC group
  - A terminating extension group
  - A UCD group
- If all appearances on a parked station are busy and no attendant or night-service extensions are configured when the call park timeout expires:
  - A parked call is dropped if no coverage path is assigned
  - A parked call is not dropped if a coverage path is assigned.

## Interactions

---

- Abbreviated Dialing

This button allows users to park calls or retrieve parked calls by pressing a button, instead of using the buttons and access codes separately.
- Automatic Wakeup

Automatic Wakeup calls cannot be parked.
- Bridged Call Appearance

If a user, active on a bridged call appearance, activates Call Park, the call is parked on the primary extension associated with the bridged call appearance.
- Call Vectoring

A call cannot be parked on a VDN extension. Also, a call that is undergoing vector processing cannot be parked.
- Code Calling Access

When a paging party dials the Code Calling Access code and the paged user's extension, the paging party is automatically parked on the paged party's extension.
- Common Shared Extensions

When a call that is parked on a common shared extension times out, the call returns to the park originator. These timeouts are treated as if the Deluxe Paging and Call Park Timeout to Originator field of the Feature-Related System-Parameters form is **y**.
- Conference

Conference calls can be parked.
- Data Privacy and Data Restriction

These features are automatically deactivated when a call is parked.
- Drop

If a digital-terminal user parks a call and then pushes the drop button, the call is unparked. If the parked call is from an internal digital-terminal user, pushing the drop button does not drop the call. The parking user must hang up to drop the call.
- Loudspeaker Paging Access

Calls to paging zones cannot be parked.
- Music-on-Hold

If a parked call involves only one party, the parked user hears music-on-hold. The parking user also hears music after first parking the call and hearing confirmation tone.

- Remote Access

A Remote Access caller cannot park a call. However, the Code Calling Access feature, an answering attendant, or a voice-terminal user can park an incoming Remote Access call.

## Call Pickup

---

Call Pickup and Directed Call Pickup allow a voice-terminal user to answer calls that alert at other extension numbers within the user's specified call pickup group. Directed Call Pickup allows voice-terminal users to pick up any call on the DEFINITY ECS system.

### Detailed description

---

#### Call Pickup

Establish a call pickup group so that when one member of a group is away, other members can answer the absent member's calls. A call pickup group usually consists of users who are located in the same area or who have similar functions.

To pick up another user's call, a user goes off-hook and dials the Call Pickup access code or presses a Call Pickup button.

If a user's voice terminal has a Call Pickup button and status lamp, then:

- The status lamp lights steadily when Call Pickup is used.
- If Call Pickup Alerting is activated, members' status lamps flash when a call comes in to any extension in the call pickup group. Group members other than the called party, can answer using Call Pickup. The called party can answer on the ringing call or bridged appearance.

**NOTE:**

Call Pickup Alerting for a voice terminal takes effect only when the Call Pickup status lamp is not lit. If Call Pickup is used to answer a call, the status lamp lights steadily and does not flash if there are additional calls to the call pickup group.

Both Call Pickup and Call Appearance status buttons flash at the called party's terminal.

If calls ring at 2 or more voice terminals in a call pickup group and a group member presses the Call Pickup button, a distribution algorithm determines which call is answered. Thus, all call pickup group members are treated equally. Specifically, when a Call Pickup button is pressed, the system searches the group extension numbers until reaching an extension with a call eligible for Call Pickup. The next time a Call Pickup button is pressed, the system searches from the *next* extension number.

For example, if extension A has 2 calls ringing and extension B has 1 call ringing, and one of extension A's calls is answered with Call Pickup, then extension B's call is answered the next time Call Pickup is used. After extension B's call is answered, a user can answer the second call to extension A.

When multiple calls ring on a voice terminal and a group member activates Call Pickup, the call with the lowest call-appearance number is answered. For example, if calls ring on the second and fourth call-appearance button on a terminal and a user at another terminal activates Call Pickup, the call on the second call-appearance button is answered.

## Directed Call Pickup

Directed Call Pickup functions like Call Pickup, except for the following:

- A user can answer an alerting call at any terminal on the system — the alerting and answering stations need not be members of the same call pickup group.
- You grant users permission to have their calls answered or to answer others' calls with Directed Call Pickup on a per-station basis on the Class of Restriction form.

## Considerations

---

- A voice terminal can be a member of only one call pickup group.
- When a call pickup group member is away from his or her voice terminal and receives a call, other call pickup group members' voice terminals do not ring. Therefore Call Pickup is only useful if either:
  - Call Pickup Alerting is enabled and call pickup group members have voice terminals with Call Pickup buttons and status lamps.
  - Call pickup group members are in close proximity and can hear each other's voice terminals ring.
- Exclusion is not supported for pickup calls.

## Interactions

---

- Abbreviated Dialing

A user can store:

  - The Directed Call Pickup FAC plus a terminal address in an Abbreviated Dial button
  - The Directed Call Pickup FAC. (The user then dials each extension.)
- Administration without Hardware

Call Pickup and Directed Call Pickup do not recognize an AWOH station without a bridged call appearance. However, once the call has gone to coverage, a member of the covering user's call pickup group can answer a call to an AWOH station. This is true for both real stations and busied-out or disconnected stations.

Once a call has gone to coverage, it can also be picked up using Directed Call Pickup.
- Attendant

Attendant can use Directed Call Pickup, but other users cannot use the feature to answer a call alerting at an attendant's terminal.
- Automatic Callback and Ringback Queuing

Neither call pickup group members or Directed Call Pickup users can answer Callback calls.

- Bridged Call Appearance

- If Call Pickup Alerting is activated and a bridged call appearance rings on a call pickup group member's terminal, other group members cannot pick up the call.

For example, if Adrian's voice terminal rings on a call to a bridged extension number that is not in Adrian's call pickup group, the call cannot be picked up.

- If Call Pickup Alerting is not activated and a voice terminal rings on a bridged call appearance, group members can pick up the call.

If Temporary Bridged Appearance on Call Pickup is enabled, a temporary-bridged appearance is maintained at the called terminal. This allows the called party to bridge onto the call after it has been picked up by another call pickup group member.

Directed Call Pickup cannot be used to pick up a call alerting at a bridged call appearance.

- Call Coverage

You can use Directed Call Pickup to answer a redirected call alerting at a covering user's terminal if there is a call-coverage temporary bridged appearance.

- Call Detail Recording

The extension number dialed by the caller is recorded as the dialed number in CDR.

- Call Forwarding

If Temporary Bridged Appearance on Call Pickup is enabled, a temporary bridged appearance is maintained if the forwarded-to station belongs to the same call pickup group as the forwarded-from station. If Temporary Bridged Appearance on Call Pickup is not enabled, a temporary bridged appearance is not maintained.

- Call Pickup Alerting

If a user who is a member of a ringing terminal's pickup group uses the Direct Call Pickup to answer a call and the call is the only call ringing for any member of the pickup group, the Call Pickup Alerting lamp goes dark when the user picks up the call.

If a user who is not a member of a pickup group uses Direct Call Pickup to answer a call, then Call Pickup Alerting does not apply.

- Call Waiting Termination

You cannot use Call Pickup to pick up a Call Waiting call.

- Conference

If Call Pickup Alerting is enabled and a call is picked up and conferenced into a conference call, the Call Pickup status lamp flashes if additional calls are available for Call Pickup.

- Consult

If *Temporary Bridged Appearance on Call Pickup* is not enabled, the consult call from the covering user appears as an idle-call appearance.

- Expert Agent Selection

EAS agents can use *Directed Call Pickup* to pick up a call or have their calls picked up. The agent's COR overrides the COR of the terminal where the agent is logged in.

If both the terminal's COR and the logged-in agent's COR allow *Directed Call Pickup*, the user picking up the call can use either the station's extension or the agent's loginID.

- Hold

If *Temporary Bridged Appearance on Call Pickup* is not enabled and a user puts a call answered with *Directed Call Pickup* on hold, the called party cannot answer the call because a temporary bridged appearance is maintained. If *Temporary Bridged Appearance on Call Pickup* is enabled, then:

- A call picked up and placed on hold at an extension remains on that extension, even if the called party answers the call.
- If *Call Pickup Alerting* is enabled and a call is picked up and placed on hold, the *Call Pickup* status lamp flashes if additional calls are available for *Call Pickup*.

- Hot Line Service and Manual Originating Line Service

Voice terminals assigned these features can be members of a call pickup group and have calls picked up, but they cannot answer calls for other pickup group members.

- Intercom — Automatic/Dial

If *Call Pickup on Intercom Calls* is activated, you can use *Call Pickup* and *Directed Call Pickup* to pick up *Automatic Intercom* calls. If it is not activated, *Automatic Intercom* calls cannot be picked up and the calls are not included in the *call-pickup-alerting-count*.

- Internal Automatic Answer

Internal calls to a terminal in a call pickup group are eligible for IAA. If the called extension in a call pickup group has IAA activated, the call is answered automatically. An extension that has IAA cannot automatically answer calls to other voice terminals in its call pickup group.

IAA-eligible calls to an IAA extension cannot be answered with *Call Pickup* because they are automatically answered at the called station. Any non-IAA-eligible calls, such as external calls that ring the IAA-active station, can be answered by members of that station's call pickup group.

- Malicious Call Trace

You cannot use Directed Call Pickup to pick up an alerting MCT call at the MCT-Controller terminal.

- Multimedia Call Handling

Do not use Call Pickup or Directed Call Pickup with a Multimedia data endpoint. However, calls alerting at the voice-station entity of a multimedia complex can be picked up with Call Pickup or Directed Call Pickup.

- Privacy — Manual Exclusion

In the following case, the called party is not dropped when Privacy — Manual Exclusion is activated.

A call is made to Station A and Station B picks it up using Call Pickup. Station A bridges onto the call by going off-hook on its call appearance. Station B activates Privacy — Manual Exclusion.

- Tenant Partitioning

Directed Call Pickup follows existing Tenant Partitioning. The feature does not function across tenant partitions unless specifically administered to do so.

- Terminating Extension

You cannot use Directed Call Pickup to pick up a call alerting at a TEG extension number.

- Transfer

If `Call Pickup Alerting` is enabled and a call is picked up and transferred, the Call Pickup status lamp flashes if additional calls are available for Call Pickup.

## Call Timer

---

Call Timer allows automatic starting of the local timer of 6400-series voice terminals on an active originating or receiving call. The timer information is displayed on the voice terminal display.

### How to administer Call Timer

---

#### Required forms

---

| Form    | Field   | Page                 |
|---------|---|----------------------|
| Station | ■ Button/Feature Button Assignments<br>— call timer | <a href="#">6-28</a> |

### Detailed description

---

The timer corresponds to the active call and is implemented using messages already defined for the 6400-series voice terminal timer.

When activated, the timer starts at the same time that the Call Detail Recording (CDR) timer starts.

The display stays active for five seconds after a call is ended or dropped.

### Interactions

---

- Conference

Assume that Call Timer is activated for all stations. If station A dials station B, when station B answers, the call timer starts on stations A and B. When station A presses the conference button, the call timer stops on station A and the system selects the second call appearance. When station A dials station C and station C answers, the call timer on station A and C starts at 0. The call timer on station B is not affected. When station A presses the conference button again, the call timer is not affected on any station.

- Hold

Assume that Call Timer is activated for all stations. Station A puts station B on hold. The call timer stops on station A, but continues if Station A returns to the call. The timer continues on station B.

- Transfer

Assume that Call Timer is activated for all stations. If station A dials station B, when station B answers, the call timer starts on stations A and B. When station A presses the transfer button, the call timer stops on station A and the system selects the second call appearance. When station A dials station C and station C answers, the call timer on station A and C starts at

0. The call timer on station B is not affected. When station A presses the transfer button again, the call on station A terminates and the call timer on station A stops.

## Call Waiting Termination

---

Call Waiting Termination notifies a user with a single-line telephone who is active on one call that a second call is waiting. Assign Call Waiting Termination on a per-voice terminal basis.

### How to administer [Call Waiting Termination](#)

---

#### Required forms

---

| Form                              | Field                               | Page                  |
|-----------------------------------|-------------------------------------|-----------------------|

|                                   | ■ Repetitive Call Waiting Interval  |                       |

---

### Detailed description

---

Single-line terminal users can place a call on hold to answer a waiting call. After answering the waiting call, they can return to the held call or toggle back and forth between the two calls. A single-line, voice-terminal user can connect to only one call at a time.

The caller hears special audible ringback tone while the call waits. Other parties on the call do not hear the tone. If Call Waiting is denied, the caller hears busy tone.

Only one call can wait at a time.

Generally, the single-line terminal user hears one quick burst of tone when a call from another voice-terminal user is waiting, 2 quick bursts of tone when an attendant-handled or an outside call is waiting, and 3 quick bursts of tone when a Priority Call is waiting.

#### NOTE:

Special ring tones are not supported over Direct Inward Dialing (DID) facilities.

An internal caller can activate Leave Word Calling (LWC) or Automatic Callback after Call Waiting has been initiated by the system.

A priority call can wait for the voice terminal to become idle even if Call Waiting Termination is not activated. However, an attendant-handled call receives busy tone unless Attendant Call Waiting Indication is set to **y**.

## 4 Basic Features

### Call Waiting Termination

Page 4-245

Calls to a Direct Department Calling (DDC) or Uniform Call Distribution (UCD) group voice terminal cannot wait. However, such calls can enter the group queue (if provided) unless the queue is full.

## Considerations

---

- Call Waiting Termination applies only to busy single-line voice terminals. Calls to multiappearance voice terminals are routed to an idle call appearance and do not wait.
- An analog voice-terminal user must place the active call on soft hold and dial the Answer Hold-Unhold feature access code to answer the waiting call. The soft-held call then becomes a hard-held call.
- If an analog single-line voice terminal has Call Waiting enabled and has initiated a conference call, Call Waiting is denied. For example, caller A (on an analog terminal) is talking to caller B, then flashes and is talking to caller C, and then flashes to conference B and C. Then, if caller D attempts to call caller A, Call Wait is denied.

## Interactions

---

Call Waiting is denied when the following features are activated at the single-line voice terminal:

- Another Call Waiting Call
- Automatic Callback (to or from the voice terminal)
- Data Privacy
- Data Restriction

A Call Waiting call cannot be picked up by a Call Pickup group member or by directed call pick-up.

## Calling Party/Billing Number

---

Calling Party Number/Billing Number (CPN/BN) allows the system to transmit CPN/BN information to an ISDN-PRI trunk group. The CPN is the calling party's telephone number. BN is the calling party's billing number. The CPN/BN may contain international country codes.

CPN/BN is used with an adjunct application. See [“Inbound Call Management” on page 9-81](#) for more information on using CPN/BN with an adjunct. See [“Multifrequency-Signaling-Related System Parameters” on page 5-228](#), [“Integrated Services Digital Network — Basic Rate Interface Endpoints” on page 4-382](#) for more information.

### How to administer CPN/BN

---

#### Required forms

| Form                                | Field                                  | Page   |
|-------------------------------------|--|--|
| Trunk Group (ISDN-PRI)              | ■ All fields including Per Call CPN/BN | <a href="#">7-219</a>                                |
| ISDN Numbering —<br>Public/ Unknown | ■ All                                  | <a href="#">7-95</a>                                 |
| or                                  |  |  |
| ISDN Numbering —<br>Private         |  | <a href="#">7-93</a>                                 |
| Processor Channel<br>Assignment     | ■ All                                  | <a href="#">5-248</a><br>or<br><a href="#">5-252</a> |

On the Trunk Group (ISDN-PRI) form, assign all fields needed to provide an ISDN/PRI between the system and the adjunct. Set the `Per Call CPN/BN` field to **can-only**, **can-pref**, **bn-only**, or **bn-pref** as required to ensure that CPN/BN information is sent with a call-offered event report to the adjunct.

On the Processor Channel Form, assign all fields for one data link. The system can support only one interface.

All ISDN-PRI- and ACD-related forms must be administered as described in the [“ISDN Numbering — Private” on page 7-93](#) and [“Automatic Call Distribution” on page 9-25](#) sections in this book.

### Interactions

---

None.

## Calling Party Number Restriction

The Calling Party Number (CPN) Restriction feature provides the Per Call and Per Line CPN Restriction capabilities available to many public network users.

Stations may be administered on a Per Line CPN Restriction basis to specify how CPN primary information is delivered for locally originated calls. Also, this feature provides you with the capability to indicate whether the CPN primary indication is delivered for locally originated calls on a per call basis.

### How to administer CPN Restriction

#### Required forms

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature Access Code (FAC)         | ■ Per Call Calling Party Number (CPN) Blocking         | <a href="#">5-113</a> |
|                                   | ■ Per Call Calling Party Number (CPN) Unblocking       |                       |
| Station form                      | ■ Per Station CPN - Send Calling Number                | <a href="#">6-28</a>  |
| System-Parameters Customer-Option | ■ ISDN-PRI   | <a href="#">5-277</a> |
| Trunk Group                       | For each trunk group, administer the following fields: | <a href="#">7-115</a> |
| — Access                          |  |                       |
| — APLT                            | ■ Per Call CPN Blocking Code                           |                       |
| — CO                              | ■ Per Call CPN Unblocking Code                         |                       |
| — DIOD                            |  |                       |
| — FX                              |  |                       |
| — ISDN-BRI                        |  |                       |
| — ISDN-PRI                        |  |                       |
| — Tandem                          |  |                       |
| — Tie                             |  |                       |
| — WATS                            |  |                       |

- To use with ISDN-PRI, set `ISDN-PRI` field on System Parameters Customer-Options form to **y**.
- To use with ISDN-BRI, set `ISDN-BRI Trunks` field on System Parameters Customer-Options form to **y**.
- CPN Restriction works on any trunk supporting MFC signaling.

## Detailed description

### Per Line CPN Restriction

You may subscribe on a per-station basis where a default parameter is set to govern the privacy indication of the Calling Party Number when it originates calls. For ISDN calls, the CPN Presentation Indicator is encoded accordingly. For non-ISDN calls going to a public network that supports the CPN Restriction feature, the network specific Feature Activation Code passes to the network to interpret and activate the desired feature.

If Per Line CPN Restriction is administered for a station, it overrides any outgoing ISDN Trunk Group administrated for sending Calling Number.

### Per Call CPN Restriction

When this feature is activated with a Feature Access Code (FAC) or feature button, you may indicate whether the CPN indication will be delivered for locally originated calls. For ISDN calls, the CPN Presentation Indicator is encoded accordingly. For non-ISDN calls going to a public network that supports the CPN Restriction feature, the network-specific FAC is passed to the network to interpret and activate the desired feature.

If Per Call CPN Restriction is activated for an outgoing call, it overrides any Per Line CPN Restriction administration for the calling station, and overrides any ISDN Trunk Group administration for sending the Calling Number.

#### NOTE:

In the case of non-ISDN calls, it is the responsibility of PBX providers to provision calling number information associated for each line with the central office (CO).

The Per Line and Per Call features are *not* supported in the following cases:

- Local switch station-to-station calls
- Attendant and data module originated calls
- DCS calls (for instance, DCS Calling Number information is not affected by either Per Call or Per Line CPN Restriction features)
- Uniform Dial Plan (UDP) calls
- Trunk Access Code (TAC) calls where either the Per Line CPN Restriction field is **y** or **r**, or when the Per Call CPN Restriction FAC is dialed before the TAC
- Non-ISDN calls that must be tandemed
- The Per Call CPN Restriction over the Adjunct Switch Application Interface (ASAI) and CTI interfaces.

## CPN Restriction Precedence

DEFINITY ECS applies the following precedence, in descending order, when originating CPN Restriction indication:

- The Per Call CPN Restriction features (Blocking, Unblocking) overrides any Per Line CPN Restriction administration on the originating station, and overrides any administration for “sending calling number” on the Trunk Group that carries the call.
- The Per Line CPN Restriction overrides any administration for “sending calling number” on the Trunk Group that carries the call.
- The existing Trunk Group administration for “sending calling number” applies when neither Per Call nor Per Line CPN Restriction applies to an outgoing call.

DEFINITY ECS applies the following precedence, in descending order, in the tandem situation:

- For a tandemed ISDN call, the current DEFINITY ECS behavior stays unchanged and only the Tandem Trunk Group’s “sending calling number” administration applies.
- For a tandemed non-ISDN call, if received with either the CPN Blocking FAC or CPN Unblocking FAC as the first digits, the tandem node attempts to apply the CPN Blocking or CPN Unblocking feature to the call. It does this by prepending any network FAC for either CPN Blocking or CPN Unblocking administered for the outgoing trunk group to the called digit information.

## **CallVisor Adjunct-Switch Application Interface**

---

CallVisor Adjunct/Switch Applications Interface (ASAI) links DEFINITY ECS and adjunct applications. The interface allows adjunct applications to access switch features and supply routing information to the switch. CallVisor ASAI improves Automatic Call Distribution (ACD) agents' call handling efficiency by allowing an adjunct to monitor, initiate, control, and terminate calls on the switch. The CallVisor ASAI interface may be used for Inbound Call Management (ICM), Outbound Call Management (OCM), and office automation/messaging applications.

CallVisor ASAI is supported by two transport types: Integrated Services Digital Network (ISDN) Basic Rate Interface (BRI) transport (CallVisor ASAI-BRI) and LAN Gateway Transmission Control Protocol/Internet Protocol transport (DEFINITY LAN Gateway).

CallVisor ASAI messages and procedures are based on the ITU-T Q.932 international standard for supplementary services. The Q.932 Facilities Information Element (FIE) carries the CallVisor ASAI requests and responses across the interface. An application program can access CallVisor ASAI services by supporting the ASAI protocol or by using a third-party vendor application programming interface (API).

See [Figure 4-3](#) for a simple ASAI configuration example.

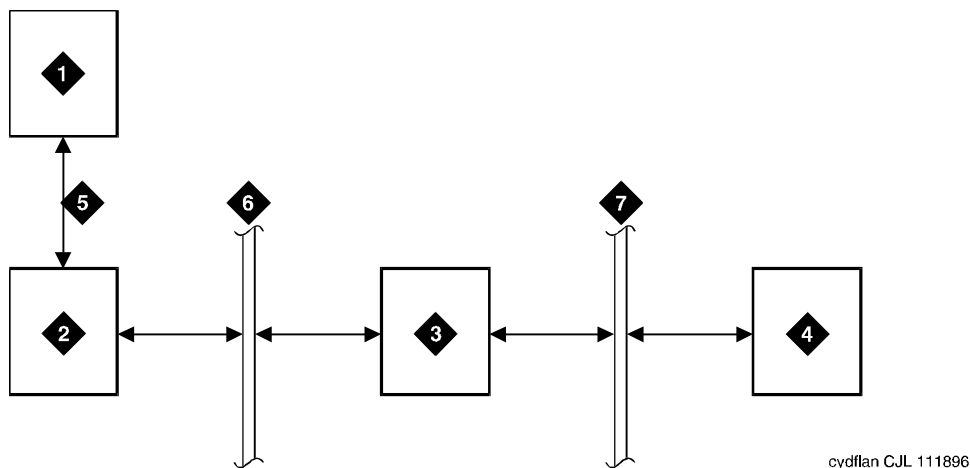

Figure Notes

- |                                       |               |
|---------------------------------------|---------------|
| 1. ASAI adjunct                       | 5. ISDN-BRI   |

|         | ■ Event Minimization |                     |

- Station form — A CallVisor ASAI endpoint must be administered with station type **ASAI** or **ASAI Proprietary Adjunct link**. Depending on the system, you can assign a maximum of 4 to 8 CallVisor ASAI endpoints.

## Detailed description

### ASAI Capabilities

[Table 4-71](#) shows which capabilities are available automatically when CallVisor ASAI is enabled.

**Table 4-71. Automatically Enabled CallVisor ASAI Capabilities**

| Capability                       | Call Control Group | Adjunct Routing Group | Domain Control Group | Event Notif. Group | Request Feature Group | Set Value Group |
|----------------------------------|--------------------|-----------------------|----------------------|--------------------|-----------------------|-----------------|
| Event Reports                    | X                  |                       | X                    | X                  |                       |                 |
| — Agent Login <sup>1</sup>       |                    |                       | X <sup>2</sup>       |                    |                       |                 |
| — Agent Logout                   |                    |                       | X <sup>2</sup>       |                    |                       |                 |
| — Alerting                       | X                  |                       | X                    | X                  |                       |                 |
| — Answered                       | X                  |                       | X                    |                    |                       |                 |
| — Busy/Unavailable               | X                  |                       | X                    | X                  |                       |                 |
| — Call Ended Event (FAC message) |                    |                       |                      | X                  |                       |                 |
| — Call Initiated                 |                    |                       | X                    |                    |                       |                 |
| — Call Offered to Domain         |                    |                       |                      | X                  |                       |                 |
| — Call Originated <sup>1</sup>   |                    |                       | X                    |                    |                       |                 |
| — Call Redirected                |                    |                       | X                    | X                  |                       |                 |
| — Call Conferenced               | X                  |                       | X                    | X                  |                       |                 |
| — Connected                      | X                  |                       | X                    | X                  |                       |                 |
| — Cut-Through                    | X                  |                       | X                    | X                  |                       |                 |
| — Denial/Reorder                 | X                  |                       | X                    | X                  |                       |                 |
| — Disconnect/Drop                | X                  |                       | X                    | X                  |                       |                 |
| — Hold                           | X                  |                       | X                    | X                  |                       |                 |
| — Queued                         | X                  |                       | X                    | X                  |                       |                 |
| — Reconnected                    | X                  |                       | X                    | X                  |                       |                 |
| — Call Transferred               | X                  |                       | X                    | X                  |                       |                 |
| — Trunk Seized                   | X                  |                       | X                    | X                  |                       |                 |

Table 4-71. Automatically Enabled CallVisor ASAI Capabilities — *Continued*

| Capability                       | Call Control Group | Adjunct Routing Group | Domain Control Group | Event Notif. Group | Request Feature Group | Set Value Group |
|----------------------------------|--------------------|-----------------------|----------------------|--------------------|-----------------------|-----------------|
| Third Party Take Control         | X                  |                       |                      |                    |                       |                 |
| Third Party Selective Disconnect | X                  |                       |                      |                    |                       |                 |
| Third Party Selective Reconnect  | X                  |                       |                      |                    |                       |                 |

- 
1. Available with Link Version 2 and above.
  2. Login and logout are provided only for domain control of ACD split; all other event reports are provided for domain control of stations.
- 

## Considerations

---

- If your system has an expansion cabinet (with or without duplication), ASAI resources should reside on the system's Processor Cabinet.

## Interactions

---

Unless noted, you can use system features with ASAI.

- **Abbreviated Dialing**  
An agent logged into an adjunct-controlled ACD split cannot use Abbreviated Dialing buttons or feature access codes (FACs). Abbreviated Dialing cannot be used through ASAI.
- **Add/Remove Skills**  
You cannot add or remove skills through ASAI.
- **Announcements**  
Split forced first or second announcements and vector announcements do not generate event reports for the ASAI adjunct. However, nonsplit announcements send event reports to the adjunct.  
  
Extensions assigned to integrated announcements cannot be domain-controlled.

## 4 Basic Features

### *CallVisor Adjunct-Switch Application Interface*

Page 4-257

- Answer Detection

CallVisor ASAI switch-classified calls, Answer Detection, and Answering Machine Detection share the same set of call-classifier ports.

- Attendant and attendant groups

Individual attendants can be parties on adjunct-monitored calls and are handled like voice-terminal users. Do not use attendant group 0 in CallVisor ASAI call control requests. Event reports are not provided for the attendant group.

Trunks seized for switch-classified calls cannot have Attendant Control activated.

- Authorization Codes

These are not supported for switch-classified calls.

- Automatic Call Distribution (ACD)

ACD agents and terminals can be domain-controlled. Vector-controlled or adjunct-controlled splits/skills cannot be monitored via Event Notification.

- Automatic Callback on Busy/Does Not Answer

You cannot activate Automatic Callback on Busy/Does Not Answer over CallVisor ASAI. A callback call appears as an incoming call to the domain controllers for a station.

- Automatic Route Selection (ARS) and Automatic Alternate Routing (AAR)

ASAI adjuncts can access ARS and AAR via Third Party Make Call, Auto\_dial and Route requests.

With ARS/AAR, the system does not inform the adjunct which trunk group was selected for a given call.

- Bridging

Direct agent calls (DACs) to an agent do not alert bridged users of the agent's extension. Monitored or controlled calls delivered to terminals with bridged call appearances send an Alerting Event Report for the principal and for every alerted bridged call appearance. A Connected Event Report is sent every time the principal or a bridged user connects to the call. Unless the complete bridge is dropped from the call, no event reports are provided when the principal or a bridged user disconnects from the call. The switch provides a Drop Event Report when the complete bridge disconnects.

Third-Party Make Calls delivered as non-ACD calls can alert bridging users, with appropriate events sent for each bridging user and principal. However, Third-Party Selective Hold, Third-Party Merge, Third-Party Reconnect, and Third-Party Selective Drop are not permitted on parties in the bridged state.

## 4 Basic Features

### *CallVisor Adjunct-Switch Application Interface*

Page 4-258

#### ■ Call Coverage

- Switch-classified calls to a destination on the system cannot go to coverage and remain alerting on the principal destination, even if coverage criteria are met. Switch-classified calls to the call originator can go to coverage (for the split or the voice terminal) if the coverage criteria are met.
- Direct agent calls placed through ASAI follow the agent's, not the split's, coverage path, like manually-dialed DACs.
- Calls redirected via ASAI Redirect Call Service continue on the coverage path if not answered.

#### ■ Call Forwarding

- Switch-classified calls to destinations with Call Forwarding remain at the destination. Switch-classified calls to originators with Call Forwarding are forwarded.
- You can activate Call Forwarding through ASAI for a physical extension or an Expert Agent Selection (EAS) agent.

#### ■ Call Park

When a call parks at a terminal that uses transfer, the system generates a Call Transferred Event Report. If the call parks using conference, the system generates a Call Conferenced Event Report.

#### ■ Call Pickup

You must use Call Pickup via the ASAI.

#### ■ Call Prompting

- Up to 24 digits collected from the last collect-digit vector command passes to the adjunct in the Call Offered to Domain Event Report and Route capability.
- ASAI switch-classified calls and Call Prompting contend for the same call-classifier ports.
- You can use a version of call prompting that does not require Call Vectoring through ASAI.

#### ■ Call Vectoring

- An adjunct can directly monitor vector directory numbers (VDNs), but not call vectors.
- While a converse step is being processed, you cannot use ASAI Send DTMF.

#### ■ CDR

Calls that the adjunct originates via Third Party Auto Dial or Third Party Make Call are marked with condition code B. Calls originated manually from a domain-controlled station are not marked with condition code B.

## 4 Basic Features

### *CallVisor Adjunct-Switch Application Interface*

Page 4-259

- Class of Restriction
  - Third Party Make Calls use the originator's voice terminal or split COR. The COR associated with the adjunct's link is not used.
  - For switch-classified calls, only the destination's COR is checked.
  - With adjunct routing, the COR of the associated VDN is checked for calling-party restriction.
- Conference/Transfer

When an agent is logged into an adjunct-controlled split, the agent must use his or her data terminal to conference and transfer calls because the voice terminal is locked.
- Coverage
  - Coverage timer. When Redirect Call redirects a call, the coverage timer for the principal is restarted. Redirect Call can be used while the coverage point is alerted.
  - Don't Answer Coverage timer. If an agent receiving a Direct Agent Call has this timer assigned and the call is redirected, the timer is cancelled.
  - Caller Response Interval (CRI). If a call is redirected from the principal via Redirect Call during the CRI, the CRI timer cancels.
  - Redirection Tone. Redirection tone is not given with Redirect Call.
- Data Call Setup

Data calls may not be set up through ASAI, unless they originate from a voice terminal.
- Directed Call Pickup

This feature cannot be activated through ASAI.
- Display Change Advice Information

This feature can be used through ASAI.
- Distributed Communication Systems (DCS)

Before using DCS with ASAI, it is recommended that you consult a Lucent Technologies representative.
- Do Not Disturb

Direct agent and switch-classified calls placed by ASAI are delivered to ACD agents even if this feature is activated.
- Drop Button Operation

You cannot use Drop Button through ASAI.

## 4 Basic Features

### CallVisor Adjunct-Switch Application Interface

Page 4-260

- Expansion Port Network (EPN)

The Expansion Interface (EI) board allows CallVisor ASAs to terminate on an EPN as well as the Primary Port Network (PPN).
- Forced Entry of Account Codes

You cannot make switch-classified calls to trunk groups with Forced Entry of Account Codes. Agents logged into adjunct-controlled splits cannot enter account codes from their voice terminals.
- Hold

Agents logged into an adjunct-controlled split can invoke Hold only via ASAI.
- Hot Line

Do not use a Third-Party Make Call request for a voice terminal that has Hot Line.
- Hunt Groups

Event-notification requests are not allowed for hunt groups (other than ACD splits).
- Interflow

When a call monitored or controlled by an adjunct interflows to another system, the system stops notifying the adjunct of events, except trunk events (for example, Trunk Seized or Drop).
- ISDN

Third Party Auto Dial calls follow ISDN rules for the originator's name and number. The Call Initiated Event Report is not sent for *en-bloc* BRI sets.
- ISDN Facilities
  - An incoming call over an ISDN facility can provide caller and called-party information, as well as other call-related information (UUI, CINFO, II-Digits) that is passed to the adjunct in event reports and Route Request capabilities.
  - An outgoing call over an ISDN facility provides call feedback events from the network (Cut-through, User Busy, Alerting, and/or Connected). A Trunk Seized Event Report is not sent for outgoing calls using ISDN facilities. Cause values for some SIT responses received will be interpreted.
  - Switch-classified calls use a call classifier on ISDN facilities and use both to classify the disposition of the outgoing call, whether or not the call is interworked, unless Call Classification After Answer system option is activated.
- Last Number Dialed

Do not invoke this feature through ASAI. Third-Party Make Call and Auto Dial save the dialed number in system memory.

## 4 Basic Features

### *CallVisor Adjunct-Switch Application Interface*

Page 4-261

- **Leave Word Calling**

The Message Waiting Lamp can be turned on and off through ASAI.
- **Lookahead Interflow**

For the receiving PBX, Lookahead Interflow information element passed in the ISDN message is included in all subsequent call-offered event report and Route capabilities for the call if the information exists. This information element includes ANI information and the originally-called VDN, but does not include digits collected at the original system.
- **MultiMedia Endpoints**

These cannot be monitored or controlled through ASAI.
- **Multiple Split Queuing**

When a call is queued in multiple split or skill hunt groups, a queued event is provided for each split/skill. When the call is removed from queue, the Alerting Event Report provides the split/skill hunt-group extension of the alerting agent.
- **Music on Hold**

These ports cannot be disconnected using `listen_disconnect` — callers still hear Music on Hold. Do use ASAI Send DTMF signals on a call with Music on Hold.
- **Priority Calling**

You can place Third-Party Make Call, Third-Party Auto Dial, and Route Select calls as priority calls. Priority Call Coverage and alerting rules apply.
- **Privacy-Manual Exclusion**

The system does not send event reports to the adjunct when a user activates Privacy-Manual Exclusion and causes other bridged users to be dropped from the call. You cannot use Third-Party Control capabilities (like Third-Party Answer or Third-Party Reconnect) to bridge users that are not allowed to bridge into an existing call as a result of Privacy-Manual Exclusion.
- **QSIG**

QSIG capabilities cannot be activated through ASAI.
- **R2-MFC Signaling**

ANI that is available from an R2-MFC trunk is passed on to ASAI adjuncts.
- **Redirection on No Answer**

When Redirect Call redirects a call from an agent with RONA active, the RONA timer is cancelled.

## 4 Basic Features

### *CallVisor Adjunct-Switch Application Interface*

Page 4-262

- Ringback Queuing

Calls originated via Third-Party Make Call or Third-Party Auto Dial to a trunk supporting Ringback Queuing or routing cannot queue.
- Russian Signaling — Intrusion on Incoming Toll Calls

Do not use this feature with ASAI.
- Send All Calls

You can activate Send All Calls via ASAI Request.
- Service Observing

You cannot initiate Service Observing through ASAI.
- Single-Line Voice Terminals

Through ASAI, you can conference up to 6 parties from a single-line voice terminal.
- Supervisor assistance

If an agent's voice terminal is locked under adjunct control, ASAI must be used to access supervisor assistance.
- Temporary bridged call appearances

These are not maintained after Redirect Call redirects a call.
- Terminating Extension Group (TEG)

A TEG is similar to bridging for purposes of CallVisor ASAI event reporting. All TEG members can be individually domain-controlled.
- Timed ACW/Agent Pause Between Calls

You cannot activate this feature through ASAI.
- Timed reminder

If an attendant makes calls that are monitored and controlled by an adjunct (including calls originated and routed with CallVisor ASAI), calls that are not answered are redirected to the attendant when the timed reminder interval expires.
- Trunk Groups

CallVisor ASAI event reporting with Personal Central Office Line (PCOL) is like bridging. Each PCOL member can be individually domain-controlled. Each member receives events as applicable to the controlled terminal.
- Voice message retrieval

An adjunct can activate the message-waiting indicator using Set Value. The voice terminal displays: "You have adjunct messages."
- Voice Terminal Display

Twenty-seven-character names are made available to ASAI.
- Wait-Answer Supervision Timer (WAST)

**4 Basic Features**

*CallVisor Adjunct-Switch Application Interface*

*Page 4-263*

If Redirect Call redirects an alerting call, the WAST is cancelled.

- World Class BRI

ASAI does not support these sets.

## Class of Restriction

---

Class of Restriction (COR) defines many different classes of call origination and termination privileges. Systems may have only a single COR, a COR with no restrictions, or as many CORs as necessary to effect the desired restrictions. Many different types of CORs can be assigned to many types of facility on the switch. For example, you can use a calling-party COR to prevent callers from accessing the public network.

### How to administer COR

---

#### Required forms

| Form                             | Field                | Page                  |
|----------------------------------|----------------------|-----------------------|
| Class of Restriction             | ■ All                | <a href="#">5-72</a>  |

| Vector Directory Number          | ■ COR                | <a href="#">9-214</a> |

### Detailed description

---

You must define a unique COR for each combination of Facility Restriction Levels (FRL), called-party restrictions, calling-party restrictions, miscellaneous restrictions, and CCSA/EPSCS off-network restrictions.

## Called-party and calling-party restrictions

Called-party and calling-party restrictions are the basis for all CORs. When no restrictions are needed, assign a single COR with called-party and calling-party restrictions set to none. This type of COR can be used for unrestricted voice terminals, trunk groups, terminating extension groups, Uniform Call Distribution (UCD) groups, Direct Department Calling (DDC) groups, data modules, attendant groups, and individual attendant extensions.

The called-party restriction is checked only at the called terminal, module, attendant console, zone, or group, even if a call redirects from one voice terminal to another. For example, if a called terminal (with no terminal restrictions) has Call Forwarding active to a restricted terminal, the call still completes.

You can administer the following called-party and calling-party restrictions:

- All-Toll
- Inward
- Manual terminating line
- Origination
- Outward
- Public
- TAC-Toll
- Termination

### Inward restrictions

You can use inward restrictions to permit users at specific voice terminals to receive only internal calls. Inward restrictions prohibit users at assigned voice terminals from receiving public-network, attendant-originated, and attendant-extended calls.

The COR of the originally-called extension is the only one checked unless you administer 3-way COR check on conference and transfer calls. Denied calls are routed to intercept tone, a recorded announcement, or the attendant for Direct Inward Dialing (DID) calls.

### Manual terminating line restrictions

You can use manual terminating line restrictions to allow users at specific voice terminals to receive calls only from an attendant or that were extended by an attendant. Calls can redirect to a manual terminating line-restricted voice terminal. The COR of the originally-called extension is the only one checked.

Local CO, foreign exchange (FX), and Wide Area Telecommunications Service (WATS) calls are routed to the attendant. DID calls are routed to an announcement or the attendant. Voice-terminal calls are routed to intercept treatment.

### Origination restrictions

You can use origination restrictions to prohibit specific voice-terminal users from originating calls. These users can still receive calls.

### Outward restrictions

You can use outward restrictions to prevent specific voice-terminal users from placing calls to the public network. These users can still place calls to other voice-terminal users, to the attendant, and over tie trunks. If necessary, an attendant or an unrestricted voice-terminal user can extend a call to an outside number for an outward-restricted voice-terminal user.

When outward restriction is applied to the `Calling Party Restriction` field on the Class of Restriction form, calls coming into a trunk with that COR will be denied if they make use of the AAR/ARS feature.

### Public restrictions

Public restrictions prohibit specific voice-terminal users from receiving public-network calls. Denied calls are routed to an intercept tone, a recorded announcement, or the attendant. Public restrictions still allow users to receive internal calls from other voice terminals or calls that were extended from the attendant.

### Termination restrictions

You can use termination restrictions to prohibit specific voice-terminal users from receiving any calls. These users can still originate calls. DID or Advanced Private-Line Termination calls route to a recorded announcement or the attendant.

### Fully restricted service restrictions

Fully restricted service restrictions prevent specific stations from accessing public-network calls. Fully-restricted station users cannot use authorization codes to deactivate this feature.

Calls from the public network to a fully-restricted station redirect to intercept treatment or to the attendant. If the call redirects to the attendant, the attendant's display indicates the call was redirected because of fully restricted service (FULL).

There are circumstances where a station with fully restricted service can access or be accessed by the public network. See ["Interactions" on page 4-274](#) for specific details.

## Miscellaneous terminal restrictions

You can use miscellaneous terminal restrictions to prohibit specific voice-terminal users from accessing other specific terminals. Restricted calls are routed to intercept tone.

## Miscellaneous trunk restrictions

You can use miscellaneous trunk restrictions to prohibit specific voice-terminal users from accessing specific trunk groups, such as WATS or CO trunk groups. Any or all trunk groups can be in a miscellaneous-trunk-restriction group. Restricted calls are routed to intercept tone.

## Toll and TAC-Toll restrictions

Toll restrictions prevent specific voice-terminal users from placing public-network calls to certain toll-call numbers. Toll restriction is *not* a COR; you assign Toll restrictions to outgoing trunk groups on the Trunk Group form. You disable TAC-toll restrictions for specific outgoing trunk groups on the Trunk Group form. For toll restriction settings, see “Toll Restricted” on page [7-131](#).

## Considerations

---

- Any number of CORs can have Fully Restricted Service set to **y**. Then, if a user attempts to call the public network, the call routes to intercept treatment.
- Miscellaneous restrictions are checked on initial call termination and on redirection.
- Miscellaneous restriction groups apply on a per-COR basis. However, you can assign the same COR to more than one facility. Facilities with the same COR may be like facilities (such as two voice terminals) or different facilities (such as a voice terminal and a trunk group).
- When a call is directed to a VDN extension, the COR of the caller and the VDN are compared to determine if the caller can access the associated call vector.
- You can enhance system security by assigning a separate COR to incoming and to outgoing trunk groups, then restricting calling between the two groups.
- A COR can be overridden by Class of Service (COS).

## Examples of Class of Restriction

---

The following examples illustrate some of the practical aspects of CORs.

## Example using calling-party and called-party restrictions and miscellaneous restrictions

To illustrate the use of calling-party and called-party restrictions and miscellaneous restrictions, assume that your system installation provides the following:

- Central-office trunks (outgoing)
- WATS
- FX trunks (outgoing)
- Voice terminals
- Data modules
- Terminating extension groups
- Loudspeaker Paging

Suppose you are given the following requirements:

- Only the attendant can access loudspeaker paging.
- Terminating Extension Groups can accept calls only from internal voice terminals.
- There are six classes of voice terminals:
  - Those that are toll restricted
  - Those that cannot call outside to a public network (outward restricted)
  - Those that can receive calls only from an attendant
  - Those that can call anywhere, any time
  - Those that cannot place FX or WATS calls
  - Those that cannot place WATS calls

### Method 1

Assign a COR to each facility or group of facilities. For simplicity, give each a unique COR:

- COR 40 — Local CO trunks
- COR 41 — WATS trunks
- COR 42 — FX trunks
- COR 43 — Attendant group
- COR 44 — Data modules
- COR 45 — Terminating extension groups
- COR 46 — Loudspeaker Paging access zones

4 Basic Features

Class of Restriction

Page 4-269

- COR 47 — Unrestricted voice terminals
- COR 48 — Toll-restricted voice terminals
- COR 49 — Outward-restricted voice terminals
- COR 50 — Voice terminals that can receive calls only from an attendant
- COR 51 — Voice terminals that cannot place FX or WATS calls
- COR 52 — Voice terminals that cannot place WATS calls

Now determine which CORs cannot call which other CORs:

- COR 40 (local CO trunks) — No restrictions
- COR 41 (WATS) — No restrictions as described above
- COR 42 (FX) — No restrictions
- COR 43 (attendant group) — No restrictions
- COR 44 (data modules) — No restrictions were stated
- COR 45 (TEG) — This COR can receive internal voice-terminal-originated calls only. Since no tie trunks are specified, use Inward Restriction to provide the desired restriction. Set Called Party Restriction to **inward**. If dial-repeating tie trunks are provided, Miscellaneous Restrictions could be used to deny trunk access to the group.
- COR 46 (Loudspeaker Paging Access zones) — Since this COR can be accessed only by an attendant, use Manual Terminating Line to provide the restriction. Set Called Party Restriction to **manual**.
- COR 47 (unrestricted voice terminals) — No restrictions
- COR 48 (toll restricted voice terminals) — Set Calling Party Restriction to **tac-toll**.
- COR 49 (outward restricted voice terminals) — Set Calling Party Restriction to **outward**.
- COR 50 (voice terminals that can receive calls only from an attendant) — Set Called Party Restriction to **manual**.
- COR 51 (voice terminals that cannot place WATS or FX calls) — None of the Calling Party Restrictions uniquely prohibit WATS and FX calls, so Miscellaneous Restrictions. Set COR 41 (WATS) and COR 42 (FX) in CALLING PERMISSION to **n**. Set Calling Party Restriction to **none**.
- COR 52 (voice terminals that cannot place WATS calls) — Set the COR 41 (WATS) in CALLING PERMISSION to **n**. Set Calling Party Restriction to **none**.

## Method 2

Alternatively, consider the restrictions to be assigned. This method is probably more difficult to use, but it minimizes the number of CORs established. This method requires 9 CORs to effect the same restrictions as 13 CORs with the previous method.

Assign the following:

- COR 20 — Manual terminating line restriction

**NOTE:**

A new Manual Terminating-Line Restriction for voice terminals was not established. COR 20 can be assigned.

- COR 21 — Inward restriction
- COR 22 — Toll restriction
- COR 23 — Outward restriction
- COR 24 — Unrestricted
- COR 25 — COR for WATS
- COR 26 — COR for FX
- COR 27 — Provides Miscellaneous Restrictions for WATS and FX. Set COR 25 and COR 26 for COR 27 to **n**.
- COR 28 — Provides Miscellaneous Restriction for WATS. Set COR 25 for COR 28 to **n**.

Now assign the appropriate COR to each physical or screening facility:

- Central-office trunks — COR 24 (unrestricted)
- WATS — COR 25 (WATS COR)
- FX — COR 26 (FX COR)
- Attendant group — COR 24 (unrestricted)
- Voice terminals — COR 22 (toll), COR 23 (outward), COR 20 (manual), COR 24 (unrestricted), COR 27 (WATS and FX miscellaneous), or COR 28 (WATS miscellaneous)
- Data modules — COR 24 (unrestricted)
- Terminating Extension Group — COR 21 (inward)
- Loudspeaker Paging trunks — COR 20 (manual)

### Example using Automatic Alternate Routing r Automatic Route Selection (AAR/ARS) FRL for control of call routing

Assume that your system provides ARS and authorization codes. You are asked to establish a group of users who must dial an authorization code to make outside calls.

Complete the following forms:

1. Feature-Related System Parameter Features form
  - a. Set Authorization Codes Enabled to **y**.
  - b. Set Authorization Code Length to **7**.
  - c. Set Authorization Code Cancellation Symbol to **#**.
  - d. Set Attendant Timeout Flag to **n**.

2. Station form

For unrestricted users, set COR to 1. For restricted users who must dial an authorization code to make outside calls, set COR to 49.

3. Authorization Codes form

For restricted users, set replacement COR to 1. Set an authorization code to their 7-digit phone number.

4. Class of Restriction form

Set originating FRLs for restricted and unrestricted users. For users with a COR of 1, set originating FRL to 7. For users with a COR of 49, set originating FRL to 0.

5. AAR/ARS Route Pattern form

For route pattern 1 and trunk group 40 (CO) set FRL to 1, NPA to 201, and Prefix Mark to 1. Assign first-choice, second-choice, and third-choice routes as follows:

| Trunk Grp | FRL | NPA | Prefix Mark | Toll List | Deleted Digits | Inserted Digits |
|-----------|-----|-----|-------------|-----------|----------------|-----------------|
| 40        | 1   | 201 | 1           |           |                |                 |
| 2         | 3   | 201 | 1           |           |                |                 |
| 32        | 3   | 201 | 1           |           |                | 9               |

For this example, trunk group 40 is a CO trunk, trunk group 2 is WATS, and trunk group 32 is a tie trunk to a System 85.

When a caller dials the ARS access code to call out, the FRL of the originating facility is compared with the FRL of the outgoing trunk group. If the FRL of the originating facility is less than the FRL of the trunk group, the restricted user is prompted (via recall dial tone) to enter an authorization code. After the

authorization code is entered, the call is routed to the CO for completion. If the FRL is insufficient to seize any trunk group in the route pattern, the user hears intercept tone.

Restricted callers are prompted for an authorization code. Unrestricted users simply dial the ARS code followed by the desired number.

## Examples using Miscellaneous Restrictions

Assume that your system installation provides the following:

- Central-office trunks
- WATS
- FX trunks
- Data modules
- Attendant service
- Voice terminals
- DID trunks
- Remote Access

In an unrestricted environment, each these could have the same COR. However, suppose the following requirements exist:

- Attendants cannot make data calls.
- Remote Access can be used only for data calls.
- DID cannot be used for data calls except through Remote Access.

(A dedicated Remote Access trunk group is not required, although one or more could be provided. This example assumes that all Remote Access is via DID.)

- There are three classes of voice terminals:
  - Those that can call anywhere, any time
  - Those that can place local CO and in-house calls only
  - Those that can place local CO, FX, and in-house calls only

Assign a COR to each facility or group of facilities. For simplicity, give each a unique COR:

- COR 30 — Local CO trunks
- COR 31 — WATS trunks
- COR 32 — FX trunks
- COR 33 — Data modules
- COR 34 — Attendant group

## 4 Basic Features

### Class of Restriction

Page 4-273

- COR 35 — Unrestricted voice terminals
- COR 36 — Voice terminals that can place in-house and local CO calls only (no FX or WATS calls)
- COR 37 — Voice terminals that can place in-house, local CO, and FX calls only (no WATS calls)
- COR 38 — DID trunk group
- COR 39 — One of the remote-access barrier codes (can be up to 10)

Now determine which CORs cannot call which other CORs:

- COR 30 (local CO trunks) — No restrictions
- COR 31 (WATS) — CORs that cannot use WATS are specified as they are encountered. WATS itself is an outgoing service without any calling capabilities. Thus, Miscellaneous Restrictions are not specified on this form. Set `Calling Party Restriction` to **none** (although this restriction has no meaning for an outgoing facility). Similarly, the `Called Party Restriction` applies to facilities capable of answering a call. Since this is not the case with WATS, set `Calling Party Restriction` to **none**.
- COR 32 (FX) — No restrictions for reasons cited above for WATS.
- COR 33 (data modules) — No restrictions for reasons cited above for WATS.
- COR 34 (attendant group) — The attendant group cannot call COR 33 (data modules). Set the `COR 33` in `CALLING PERMISSION` to **n**.
- COR 35 (unrestricted voice terminals) — No restrictions
- COR 36 (no FX or WATS calls) — This COR cannot call COR 32 (FX) or COR 31 (WATS). For CORs 32 and 31, set `CALLING PERMISSION` to **n**.
- COR 37 (no WATS calls) — This COR cannot call COR 31 (WATS). For COR 31, set `CALLING PERMISSION` to **n**.
- COR 38 (DID) — This COR cannot call COR 33 (data modules). For COR 33, set `CALLING PERMISSION` to **n**.
- COR 39 (Remote Access barrier code) — This COR can be used for data calls only. Thus, this COR can call COR 33, but not CORs 30 (local CO), 31 (WATS), 32 (FX), 34 (attendant group), 35, 36, or 37 (voice terminals). For CORs 30, 31, 32, 34, 35, 36, and 37, set `CALLING PERMISSION` to **n**. (The CORs listed in the `CALLING PERMISSION` field can be viewed as terminating or screening CORs that can or cannot be called by the originating COR.) Since COR 38 [DID] is neither a terminating nor a screening COR, you do not need to consider it when you assign the barrier-code COR.

## Interactions

---

- **AAR/ARS**

Originating FRLs are assigned via a COR. Termination and Miscellaneous Restrictions do not apply to ARS/AAR calls.
- **AAR/ARS Partitioning**

Partition Group Numbers are assigned via a COR.
- **Bridged Call Appearance**

The COR assigned to a voice terminal's primary extension also applies to calls originated from a bridged call appearance of that extension on another terminal.
- **Call Coverage**

Users who normally are restricted from calls can still receive calls directed to them via Call Coverage. When a call goes to coverage, the called party's (not the covering party's) restrictions are used.
- **Call Forwarding All Calls**

If a call is restricted between the forwarding and forwarded-to extensions, Call Forwarding is denied. Restrictions are always checked when Call Forwarding is activated, but not when a call is forwarded.
- **Controlled Restriction**

Restrictions assigned via Controlled Restriction override COR restriction.
- **Emergency Access to Attendant**

Emergency Access to Attendant calls are not restricted by COR.
- **Forced Entry of Account Code**

This feature is assigned via a COR.
- **Loudspeaker Paging**

The station number represents a loudspeaker paging zone. Each Loudspeaker Paging Access zone and each Code Calling Access zone is assigned a COR.
- **Private Network Access**

Access to the public network via a private network is allowed or denied via a COR (assuming that the private network provides the capability to access the public network).

### Interactions for called-party and calling-party restrictions

- **Controlled Restriction**

Controlled Restrictions are checked when the system authorizes a call.

## 4 Basic Features

### *Class of Restriction*

Page 4-275

- Night Service

Night Station Service overrides Inward, Manual Terminating Line, and Public Restrictions.

Night Station — Trunk Answer From Any Station overrides Inward, Manual Terminating Line and Public Restrictions.

- Tie-Trunk Access

Incoming dial-repeating tie-trunk calls can be completed directly to an inward-restricted or public-restricted extension but cannot be extended by an attendant to an inward-restricted voice terminal.

- Transfer

Incoming trunk calls cannot be transferred to an inward-restricted extension when a 3-way COR check is made.

Incoming trunk calls can be transferred from an unrestricted extension to an inward-restricted or public-restricted extension if the 3-way COR check on Conference is overridden.

### **Interactions for fully restricted service restrictions**

- Centralized Attendant Service

Since COR information is not passed over Release Link Trunks (RLT), fully restricted service allows all CAS calls. Therefore, CAS allows a public network call to complete to a fully-restricted station.

- Distributed Communication System

Fully Restricted Service allows all DCS calls because COR information is not transparent for DCS. DCS can allow a public network call to be completed to a Fully Restricted station.

- Emergency Transfer

All authorization features are bypassed when an Emergency Transfer station is connected to an Emergency Transfer trunk in the Emergency Transfer Mode.

- Hunt Group

Stations with Fully Restricted Service should not be assigned to Hunt Groups without Fully Restricted Service.

The COR assigned to the Hunt Group is checked on calls redirected by the DDC or UCD of the hunt group. Extensions in the hunt group that have Fully Restricted Service can receive calls from the public network (via the hunt group) if the COR of the Hunt Group does not have Fully Restricted Service.

- Personal Central Office Line

Stations with Fully Restricted Service should not be assigned PCOL.

- Remote Access

If a barrier code is entered during connection to remote access, the code's associated COR is used for authorization checks. If remote access does not require a barrier code, then the default barrier code's COR is used. Remote Access can require an authorization code instead of or in addition to the barrier code. If an authorization code is required, the authorization code's associated COR overrides the barrier code's COR.

Fully restricted service should not be assigned to a station with the following features or conditions:

- Abbreviated Dialing
- Bridged Call Appearance
- Attendant stations
- Night Service stations
- Stations that are Call Coverage or Send All Calls points
- Stations that are Call Forward destinations
- Stations that are Call Pickup points

### **Interactions for miscellaneous terminal and trunk restrictions**

- AAR/ARS

AAR and ARS access to a trunk group override miscellaneous trunk restrictions.

- Abbreviated Dialing Privileged Group Number List

A voice-terminal user with authorization to access an Abbreviated Dialing Privileged Group Number List can place calls to any number on that list. COR assignments are not checked.

- Privileged System Number List

A voice-terminal user with authorization to access a Privileged System Number List can place calls to any number on that list. COR assignments are not checked.

## Class of Service

---

Class of Service (COS) determines whether or not voice-terminal users can access the following features and functions.

- Features
  - Automatic Callback
  - Call Forwarding
  - Data Privacy
  - Priority Calling
  - Restrict Call Forwarding Off-Net
  - Call Forward Busy/Don't Answer
  - Personal Station Access
  - Extended Forwarding All
  - Extended Forwarding Busy/Don't Answer
  - Trunk-to-Trunk Transfer Restriction Override
- Functions
  - Console permission
  - Off-hook alert
  - Client room

## How to administer COS

---

### Required forms

---

| Form                 | Field              | Page                  |
|----------------------|--------------------|-----------------------|
| Class of Service     | All                | <a href="#">5-81</a>  |
| Attendant Console    | COS                | <a href="#">5-35</a>  |
| Console-Parameters   | COS                | <a href="#">5-86</a>  |
| Data Modules         | COS                | <a href="#">6-226</a> |
| Station              | COS                | <a href="#">6-28</a>  |
| Remote Access        | COS (Barrier Code) | <a href="#">5-258</a> |
| Packet Gateway Board | COS                | <a href="#">5-246</a> |

### Detailed description

---

Restriction groups and call origination/reception privileges are defined and assigned by a COR, not a COS.

There are 16 possible COS. Administer each desired allowed/denied combination of features and functions to a COS, and indicate that COS number when administering voice terminals.

### Console Permission

Console Permission allows multiappearance voice-terminal users to control the same features that the attendant controls. Console permission is usually provided to front-desk personnel in a hotel or motel. With console permission, you can:

- Activate Automatic Wakeup for another extension
- Activate and deactivate controlled restrictions for another extension or group of extensions
- Activate and deactivate Do Not Disturb for another extension or group of extensions
- Activate Call Forwarding for another extension
- Add and remove agent skills

### Off-Hook Alert

You can administer Off-Hook Alert only if Emergency Access to the Attendant is provided. Off-Hook Alert allows you to administer yes or no to each of the 16 COS parameters.

## **Client Room**

You can administer Client Room only when Hospitality Services are provided and you have a Property Management system interface. Client Room allows users to access Check-In, Check-Out, Room Change/Swap, and Maid status. In addition, Client Room is required at consoles or terminals that are to receive message-waiting notification.

## **Interactions**

---

- **Hunt Groups**

Because hunt groups have an implied COS of 1, be cautious when you assign restrictions to COS 1.

## Code Calling Access

---

Code Calling Access allows attendants, voice-terminal users, and tie-trunk users to page with coded chime signals.

### How to administer Code Calling Access

---

#### Required forms

---

| Form               | Field                               | Page                  |
|--------------------|-------------------------------------|-----------------------|
| Loudspeaker Paging | ■ Code Calling Playing Cycles (1–3) | <a href="#">5-209</a> |
|                    | ■ Port                              |                       |
|                    | ■ Code Calling TACs                 |                       |
|                    | ■ Code Calling CORs                 |                       |
| Code Calling IDs   | ■ All                               | <a href="#">5-84</a>  |

### Detailed description

---

A paging party dials the Code Calling Access code and the extension of the person to be paged. The paging party is automatically parked (through Call Park) on the paged party's extension. The system translates the number to a chime code and then plays the code over loudspeakers. The paged party, recognizing the chime code, can answer the call from any system voice terminal by dialing the Call Park Answer Back access code and his or her own extension.

You can provide up to 9 individual paging zones, such as conference rooms and warehouses. In addition, one zone can activate all zones simultaneously. Each paging zone requires a separate Code Calling Access code.

### Considerations

---

- With Code Calling Access, users do not have to be at their own voice terminal to answer calls. Users who are frequently away from their voice terminal or at a location where a ringing voice terminal might be disturbing can be assigned a chime code. Users can answer parked calls from any system voice terminal.
- You can provide as many as 125 3-digit chime codes. Only one extension can be assigned to a chime code. You can administer chime codes to play up to 3 times.

## Interactions

---

- Abbreviated Dialing  
If Abbreviated Dialing is used for Code Calling Access, do not use special characters. Otherwise, the call is denied.
- Call Park  
This feature is automatically provided with Code Calling Access.
- Conference — Attendant  
A call cannot be conferenced while the attendant is accessing paging equipment. The attendant can, however, release the call after paging the called party.
- Conference — Terminal  
A call cannot be conferenced while the attendant is accessing paging equipment.
- Controlled Restriction  
Controlled Restriction prohibits use of Code Calling Access.
- Loudspeaker Paging Access (PagePac Paging)  
It is not possible to use a PagePac paging system for Code Calling Access when multizone paging is desired. The PagePac paging systems expect a 2-digit code to access a particular zone. The system, however, immediately plays the chime code once a connection is established.
- Miscellaneous Trunk Restriction  
Voice terminals and tie trunks with this restriction cannot use Code Calling Access.
- Origination Restriction  
This restriction prohibits use of Code Calling Access.
- Transfer  
A call cannot be transferred while the attendant is accessing paging equipment.

## Conference — Attendant

---

Conference — Attendant allows the attendant to set up a conference call for as many as six conferees, including the attendant.

### How to administer Conference — Attendant

---

#### Required forms

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature-Related System-Parameters | ■ Public Network Trunks on Conference Call         | <a href="#">5-123</a> |
|                                   | ■ Conference Parties with Public Network Trunks    |                       |
|                                   | ■ Conference Parties without Public Network Trunks |                       |

---

### Detailed description

---

To set up a conference, the attendant dials the number of a conferee and presses the split key to add each party.

### Considerations

---

- Use this feature whenever an attendant needs to talk with more than one party at the same time, or to establish a conference call for parties outside the system.
- The attendant can set up only one conference call at a time. The attendant can hold a conference call on the console or release from it.
- The attendant cannot handle other calls while setting up a conference call.
- Only the attendant can add another party to the call, once the attendant is one of the conferees, no matter who established the call.

### Interactions

---

- Bridged Call Appearance  
A user can press the Bridged Appearance button and join a conference call if the call never had 6 parties.
- Call Vectoring  
A VDN can be included as a party in a conference call only after vector processing terminates for that call (for example, after a successful route-to command).

- Trunk-to-Trunk Transfer

If Trunk-to-Trunk Transfer is disabled and the attendant releases from a conference call involving only trunk conferees, the trunks disconnect.

When a multifunction station (BRI/Digital/Hybrid) user dials enough digits to route a call, but could route differently by dialing additional digits, the station does not recognize the Conference or Transfer buttons. The user delays dialing for 3-seconds or dials # to indicate the call route based on the digits already dialed. The Conference or Transfer buttons are then recognized and the switch completes the operation.

Attendant conferencing may not operate properly if the CO does not provide answer supervision. In this case, the Answer Supervision Timeout and Outgoing End of Dial fields are set to the same nonzero number, and the Receive Answer Supervision field is set to **n**.

If the CO *does* provide answer supervision, you can set Answer Supervision Timeout to **0** and Receive Answer Supervision to **y**.

## Conference — Terminal

---

Conference — Terminal allows multiappearance voice-terminal users to make 6-party conference calls without attendant assistance. This feature also allows single-line voice-terminal users to make 3-party conference calls without attendant assistance.

### How to administer Conference — Terminal

---

#### Required forms

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature-Related System Parameters | ■ Public Network Trunks on Conference Call         | <a href="#">5-123</a> |
|                                   | ■ Conference Parties With Public Network Trunks    |                       |
|                                   | ■ Conference Parties Without Public Network Trunks |                       |
|                                   | ■ Conference Tone                                  |                       |

---

### Considerations

---

- A single-line voice terminal can have up to 6 parties on a conference call, if each conferee adds another conferee. For example, one user can add a party, who then adds a third party, and so on.
- If you do not allow trunk-to-trunk connections and a voice terminal releases from a conference call (where all of the other parties were connected to the conference via trunks), then all parties are disconnected.
- If an analog single-line set has Call Wait active and creates a conference call, Call Wait is rendered inactive as long as the single-line set is on the call. For example, caller A on an analog set talks to caller B, flashes to talk to caller C, and flashes to conference B and C. Then, if caller D calls caller A, Call Wait is denied.

### Interactions

---

- Bridged Call Appearance  
A Bridged Appearance button can be used to make conference calls. A Bridged Appearance can bridge onto a conference call only if there were never 6 parties on the conference.

- Call Vectoring

A call to a VDN can be included as a party in a conference call only after vector processing terminates for that call (for example, after a successful route-to command).

- Class of Restriction

If `Restriction Override` is set to **all**, the COR of the party being added is always checked against the COR of the party controlling the add-on, but the new party's COR is not checked against any other conferee's CORs.

- Trunk-to-Trunk Transfer

When a multifunction station (BRI/Digital/Hybrid) dials sufficient digits to route a call, but could route differently if additional digits were dialed, the station does not recognize the Conference or Transfer buttons. The user must delay dialing for 3 seconds or dial # to indicate that the call can be routed based on the digits already dialed. The Conference or Transfer buttons are then recognized and the switch completes the call.

## Consult

---

Consult allows a covering user, after answering a coverage call, to call the principal (called party) for private consultation.

Activating Consult places the caller on hold and establishes a private connection between the principal and the covering user. The covering user can then add the caller to the conversation, transfer the call to the principal, or return to the caller.

### How to administer Consult

---

#### Required forms

---

| Form                      | Field  | Page                 |
|---------------------------|--|----------------------|
| Station (multiappearance) | ■ Button/Feature Button Assignments<br>— consult | <a href="#">6-28</a> |

---

### Considerations

---

- Using Consult allows a covering user to confer with the principal, and determine whether he or she wishes to speak with the called party.

### Interactions

---

- Bridged Call Appearance  
Bridged Call Appearances of the principal's extension are not alerted on a Consult call to the principal extension.
- Call Coverage  
Consult is used only in conjunction with Call Coverage. See "[Call Coverage](#)" on page 4-146 for details.
- Call Waiting Termination  
A Consult call acts as a priority call and waits at a single-line voice terminal, even if the terminal does not have Call Waiting Termination assigned.
- Temporary Bridged Appearance  
Consult calls use the Temporary Bridged Appearance maintained on the call. At the end of a Consult call, the bridged appearance is no longer maintained.

## Coverage Callback

---

Coverage Callback allows a covering user to leave a message for the principal (the called party) that a call has been received from a certain party.

### How to administer Coverage Callback

---

#### Required forms

---

| Form                      | Field  | Page                 |
|---------------------------|--|----------------------|
| Station (multiappearance) | ■ Button/Feature Button Assignments<br>— cov-cback | <a href="#">6-28</a> |

---

### Interactions

---

- Call Coverage

Coverage Callback is used only in conjunction with Call Coverage.

## Coverage Incoming Call Identification

Coverage Incoming Call Identification (ICI) allows a member of a Coverage Answer Group to identify an incoming call to that group even though the member does not have a display terminal.

When an incoming call is directed to a Coverage Answer Group, the Coverage Answer Group status lamp button lights. A second coverage call takes control of the Coverage ICI lamp. When the call is released it does not return control to the previous call.

The user presses the Incoming Call Identification (in-call-id) button to identify the hunt or coverage answer group associated with the current, incoming call.

### How to administer Coverage ICI

#### Required forms

| <u>Form</u>               | <u>Field</u>   | <u>Page</u>          |
|---------------------------|--|----------------------|
| Station (multiappearance) | ■ Button Assignment<br>— in-call-id (Type: __ Grp: __) | <a href="#">6-28</a> |

### Interactions

- Call Coverage

Coverage ICI is used only in conjunction with Call Coverage.

## Customer-Provided-Equipment Alarm

The Customer-Provided-Equipment (CPE) Alarm is a customer-provided device, such as a lamp or a bell, that indicates an alarm situation. This device lets you know that a system alarm has occurred and that the system has attempted to contact the appropriate service organization about the problem.

DEFINITY ECS activates the CPE Alarm when an event occurs that corresponds to, or is more severe than, the administered alarm level. You can administer the CPE Alarm for only one of the following levels.

- Major Alarm — A vital system hardware component has failed. An alarm of this level may seriously affect overall service.
- Minor Alarm — A hardware component that may affect service on a limited scale has failed.
- Warning Alarm — A problem may exist with a hardware component, but the problem does not affect service.

DEFINITY ECS automatically deactivates the CPE Alarm when the problem that caused the alarm is resolved. If there are multiple problems, the CPE Alarm remains active until all problems at or above the administered alarm-activation level are resolved.

For more information, see *DEFINITY Enterprise Communications Server Installation for Single-Carrier Cabinets* or *DEFINITY Enterprise Communications Server Installation for Multiple-Carrier Cabinets* manuals.

### How to administer CPE Alarm

#### Required forms

| Form                                  | Field                        | Page                  |
|---------------------------------------|------------------------------|-----------------------|
| Maintenance-Related System Parameters | ■ CPE Alarm Activation Level | <a href="#">5-212</a> |

### Interactions

- Power Failure Transfer

The CPE Alarm is always activated during a Power Failure Transfer regardless of the administered alarm-activation level. This is true even if the alarm is not administered at any level.

## Data Call Setup

---

Data Call Setup provides multiple methods to set up a data call:

- Data-terminal (keyboard) dialing
- Voice-terminal dialing
- Hayes AT command dialing
- Permanent-switched connections
- Administered connections
- Automatic-calling unit interface (MPD and HSC)
- Hotline dialing

### How to administer Data Call Setup

---

Assign ADU-type hunt groups that connect to terminal servers on a host computer as no keyboard dialing.

#### Required forms for data-terminal dialing

---

| Form             | Field                      | Page                  |
|------------------|----------------------------|-----------------------|
| Data Module      |                            |                       |
| — PDM/TDM        | ■ All                      | <a href="#">6-243</a> |
| — Data Line      | ■ All                      | <a href="#">6-234</a> |
| — 7500           | ■ All                      | <a href="#">6-252</a> |
| Modem Pool Group | ■ Circuit Pack Assignments | <a href="#">5-223</a> |

Use voice-terminal dialing to connect the data terminal to an analog modem or when a data terminal is not accessible for dialing.

#### Required forms for voice-terminal dialing

---

| Form                          | Field   | Page                  |
|-------------------------------|---|-----------------------|
| Feature Access Codes          | Data Origination Access Code                    | <a href="#">5-113</a> |
| Station<br>(multi-appearance) | Feature Button Assignments<br>— data-ext (Ext:) | <a href="#">6-28</a>  |
| Data Module                   |   |                       |
| — PDM/TDM                     | ■ All   | <a href="#">6-243</a> |
| — Data Line Data<br>Module    | ■ All   | <a href="#">6-234</a> |
| Modem Pool Group              | ■ Circuit Pack Assignments                      | <a href="#">5-223</a> |

Depending on the hardware used, assign ports to the following:

- Data modules
- BCTs/510Ds
- 7400D-series or CALLMASTER digital voice terminals
- 7500D-series voice terminals with ADM
- Analog modems (port is assigned using 2500 voice-terminal form)

### Detailed description

In addition to data-terminal and voice-terminal dialing, the system accepts calls from other devices, such as a modular-processor data modules (MPDM) equipped with an automatic-calling unit (ACU) interface module. Use this device to dial from a host computer.

### Data Call Setup for DCP and ISDN-BRI modules

In addition to the numeral, #, and \* characters found on a touch-tone pad, the following special characters can be dialed.

#### Special characters

| Character              | Use   |
|------------------------|---|
| SPACE, -, (, and)      | improves legibility. The switch ignores these characters during dialing.  |
| + character (wait)     | interrupts or suspends dialing until the user receives dial tone  |
| , (pause)              | inserts a 1.5-second pause  |
| % (mark)               | indicates digits for end-to-end signaling (touch-tone). This is required when the trunk is rotary. It is not required when the trunk is touch-tone. |
| UNDERLINE or BACKSPACE | corrects previously typed characters on the same line   |
| @                      | deletes the entire line and starts over with a new DIAL: prompt   |

Each line of dialing information can contain up to 42 characters (the + and % characters count as two each).

Examples of dialing are:

- DIAL: 3478
- DIAL: 9+(201) 555-1212

- DIAL: 8, 555-2368
- DIAL: 9+555-2368+%9999+123 (remote access)

Alphanumeric dialing allows a data-terminal user to make a data call by entering an alphanumeric name.

Basic-digit dialing is provided through an ADM or 7500B data module. The user can enter digits from 0 to 9, \*, and # from a 7500 series voice-terminal keypad or an EIA-terminal interface.

Call Forwarding All Calls allows incoming data calls to redirect to a user-designated extension. The attendant or a forwarding party activates the feature by dialing a FAC.

Default Dialing allows a data-terminal user to call a preadministered destination by pressing Enter. The user can call other destinations by entering the complete address.

Data Hotline is a security feature. The switch terminates calls to a preadministered hotline. The system discards any address string and routes the call as if the hotline-destination address were entered. This feature does not affect incoming calls. This feature is mutually exclusive with Default Dialing.

An AC is an end-to-end connection between two endpoints that is automatically established whenever the system restarts or when you administer the connection to be active.

After you administer the ADM as one endpoint of a connection, the switch establishes the connection at the scheduled time and maintains it for the specified length of time. After the call is accepted, the data set enters into continuous mode for the specified length of time. If the switch reboots during the connection, the connection reinitiates. If the connection drops, the switch reinitiates the connection.

The system handles all presently defined BRI bearer data-call requests. Some capabilities that are not supported by Lucent terminals are provided by non-Lucent terminals. If the switch does not support a capability, a proper cause value returns to the terminal.

BRI terminals receive a cause or reason code that identifies why a call is being cleared. The BRI data module converts certain cause values to text messages for display. In a passive-bus multipoint configuration, the system supports two BRI endpoints per port, thus doubling the capacity of the BRI circuit pack. When you change the configuration of a BRI from point-to-point to multipoint, the original endpoint does not need to reinitialize. Only endpoints that support SPID initialization can be administered in a multipoint configuration.

The following call-progress messages and their meanings are provided for DCP and ISDN-BRI modules.

**Call-progress messages**

| Message             | Application | Meaning  |
|---------------------|-------------|--|
| DIAL:               | DCP         | Equivalent to dial tone. Enter the desired number or FAC followed by Enter.  |
| CMD                 | BRI         | Equivalent to dial tone. Enter the desired number or FAC followed by Enter.  |
| RINGING             | DCP, BRI    | Equivalent to ringing tone. Called terminal is ringing.  |
| BUSY                | DCP, BRI    | Equivalent to busy tone. Called number is busy or out of service.  |
| ANSWERED            | DCP, BRI    | Call is answered.  |
| ANSWERED - NOT DATA | DCP         | Call is answered and a modem answer tone is not detected.  |
| TRY AGAIN           | DCP, BRI    | Equivalent to reorder tone. System facilities are currently not available.   |
| DENIED              | DCP, BRI    | Equivalent to intercept tone. Call cannot be placed as dialed.   |
| ABANDONED           | DCP, BRI    | Calling user has abandoned the call.   |
| NO TONE             | DCP, BRI    | Tone is not detected.  |
| CHECK OPTIONS       | DCP, BRI    | Data-module options are incompatible.  |
| XX IN QUEUE         | DCP, BRI    | Current position in queue.   |
| PROCESSING          | DCP, BRI    | Out of queue. Facility is available.   |
| TIMEOUT             | DCP, BRI    | Time is exceeded. Call terminates.   |
| FORWARDED           | DCP, BRI    | Equivalent to redirection-notification signal. Called terminal activates Call Forwarding and receives a call, and call is forwarded. |
| INCOMING CALL       | DCP, BRI    | Equivalent to ringing.   |
| INVALID ADDRESS     | DCP         | Entered name is not in alphanumeric-dialing table.   |
| WRONG ADDRESS       | BRI         | Entered name is not in alphanumeric-dialing table.   |

*Continued on next page*

**Call-progress messages — *Continued***

| Message           | Application | Meaning   |
|-------------------|-------------|---|
| PLEASE ANS-       | DCP, BRI    | Originating voice-terminal user transferred call to data module using One-Button Transfer to Data.        |
| TRANSFER          | DCP         | Data Call Return-to-Voice is occurring.   |
| CONFIRMED         | DCP, BRI    | Equivalent to confirmation tone. Feature request is accepted, or call has gone to a local coverage point. |
| OTHER END         | DCP, BRI    | Endpoint has terminated call.   |
| DISCONNECTED      | DCP, BRI    | Call is disconnected.   |
| WAIT              | DCP, BRI    | Normal processing continues.  |
| WAIT, XX IN QUEUE | DCP         | Call is in a local hunt-group queue.  |

**Data Call Setup for DCP modules**

**Data-terminal dialing**

DCP data-terminal dialing allows a user to set up and disconnect data calls directly from a data terminal as follows.

1. At the DIAL: prompt, the user types the data number. The message RINGING displays.
2. If the call is queued, the message WAIT, XX IN QUEUE displays. The queue position XX updates as the call moves up in queue.
3. To originate and disconnect a call, the user presses BREAK. If the terminal does not generate a 2-second continuous break signal, the user can press originate/disconnect on the data module.
4. The user can enter digits at the DIAL: prompt.

**Voice-terminal dialing**

DCP voice-terminal dialing allows voice-terminal users to originate and control data calls from a voice terminal. Use DCP voice-terminal dialing when a data terminal is not available.

Users can set up a call using any unrestricted voice terminal and then transfer the call to a data endpoint.

The primary way to make data calls is with multiappearance voice-terminal data-extension buttons. Assign any administrable feature button as a data-extension button. The data-extension button provides one-touch access to a data module.

The following options, either alone or combined, permit flexibility in making data calls from a voice terminal.

- One-Button Transfer to Data

A user can transfer a call to the associated data module by pressing the data-extension button after the endpoint answers.

- Return-to-Voice

A user can change the connection from data to voice. The user presses the data-extension button associated with the busy data module. If the user hangs up, the call disconnects. Return of a data call to the voice terminal implies that the same data call is continued in the voice mode, or transferred to another data endpoint.

- Data Call Preindication

A user, before dialing a data endpoint, can reserve the associated data module by pressing the data-extension button. This ensures that a conversion resource, if needed, and the data module are reserved for the call. Use of Data Call Preindication before 1-button transfer to data is recommended for data calls that use toll-network facilities. Data Call Preindication is in effect until the associated data-extension button is pressed again for a 1-button transfer; there is no time-out.

## Data Call Setup for ISDN-BRI modules

### Data-terminal dialing

A user can set up and disconnect data calls directly from a data terminal without using a voice terminal as follows:

1. The user presses Enter a few times. If the CMD: prompt does not appear, the user presses Break A + T at the same time, and then presses Enter.
2. At the CMD: prompt, the user types and presses Enter.
3. To disconnect, the user enters ++++. At the CMD: prompt, the user types end and presses Enter.

### Voice-terminal dialing

ISDN-BRI voice-terminal dialing allows ISDN-BRI voice-terminal users to originate a data call. The user presses the data button on the terminal, enters the number on the dial pad, and then presses the data button again.

The following data functions are not available on ISDN-BRI voice terminals:

- One-Button Transfer to Data
- Return-to-Voice
- Data Call Preindication
- Voice-Call Transfer to Data and Data-Call Transfer to Voice

## Considerations

---

- BRI has a voice-to-data restriction. A voice terminal cannot call a data terminal, and a data terminal cannot call a voice terminal.
- BRI voice terminals cannot have data-extension buttons. DCP sets have these buttons, but cannot have data-extension buttons for BRI.
- When a voice-terminal user places a data call with a modem, the user dials the data-origination access code assigned in the system before dialing the endpoint.
- The number of assigned data-extension buttons per voice terminal is not limited. Assign voice-terminal buttons that access the data module.
- Voice-terminal dialing is not available in ISDN-BRI applications because ISDN-BRI terminals do not support voice-call transfer to data or data-call transfer to voice.

## Interactions

---

- Abbreviated Dialing

Only 22 of the 24 (maximum) digits in an abbreviated-dialing number are available for keyboard dialing. The remaining two digits must contain the wait indicator for tone detection.
- Call Coverage

A hunt group made up of data endpoints cannot be assigned a coverage path.
- Call Detail Recording

CDR records the use of modem pools on trunk calls.
- Call Forwarding All Calls

Calls received by a data module can be forwarded. Activate Call Forwarding All Calls with data-terminal (keyboard) dialing. If the forwarded-to endpoint is an analog endpoint and the caller is a digital endpoint, modem pooling is activated automatically.
- Internal Automatic Answer

Data calls are not eligible for IAA.

- Modem Pooling

Modem Pooling is available on data calls. The system automatically inserts a modem if one is needed. Data Call Preindication or Data Origination can be used to indicate the need for a modem.

- UCD

UCD can provide a group of data modules or analog modems for answering calls to connected facilities (for example, computer ports).

- World-Class Tone Detection

Multiple-line data-terminal dialing is supported if the administered level of tone detection is precise. You can administer tone-detection options. The message that Data Call Setup sends to users varies according to the option.

If the option is not set to precise, and a data call is set up over an analog trunk, messages describing the status of the called endpoint (for example, RINGING, BUSY, TRY AGAIN) change according to which tone-detection option is selected.

## Data Hotline

---

Data Hotline provides for automatic-nondial placement of a data call preassigned to an endpoint when the originating switch goes off-hook. Use for security purposes.

### How to administer Data Hotline

---

#### Required forms

**Detailed description**

The system automatically places Data Hotline calls to preassigned extensions or off-premises numbers. Calling terminals are connected to the system by a data module. Users should store the destination number in the abbreviated dialing list for future reference.

**Considerations**

- Data Hotline offers fast and accurate call placement to data endpoints. Users who frequently call the same endpoint can automatically place the call by going off-hook.

## Interactions

---

- Call Forwarding — All Calls

A Data Hotline caller cannot activate both Call Forwarding and Data Hotline. Dialing the Call Forwarding feature access code (FAC) causes activation of the Data Hotline instead.

- Data Terminal (Keyboard) Dialing

Normal terminal-dialing text displays for Data Hotline calls except the initial-dial prompt normally given on off-hook for origination.

## Data Privacy

---

Data Privacy protects analog data calls from being disturbed by any of the system's overriding or ringing features.

### How to administer Data Privacy

---

#### Required forms

---

| Form                      | Field                      | Page                  |
|---------------------------|----------------------------|-----------------------|
| Feature Access Code (FAC) | ■ Data Privacy Access Code | <a href="#">5-113</a> |
| Class of Service          | ■ Data Privacy (0–15)      | <a href="#">5-81</a>  |
| Station                   | ■ COS (0–15)               | <a href="#">6-28</a>  |

### Detailed description

---

To activate this feature, the user dials the activation code at the beginning of the call.

### Considerations

---

- Connections involving one or more digital data endpoints (data module) are protected from receiving system-generated tones.
- Data Privacy applies to both voice and data calls. You can activate Data Privacy on Remote Access calls, but not on other incoming trunk calls. Data Privacy is canceled if a user transfers a call, is added to a conference call, is bridged onto a call, or disconnects from a call. You can activate Data Privacy on calls originated from attendant consoles.

### Interactions

---

- Attendant Call Waiting and Call Waiting Termination  
If Data Privacy is active, Call Waiting is denied.
- Bridged Call Appearance — Single-Line Voice Terminal  
If you activate Data Privacy or assign Data Restriction to a station involved in a bridged call and the primary terminal or bridging user attempts to bridge onto the call, this action overrides Data Privacy and Data Restriction.
- Busy Verification  
Busy Verification cannot be active when Data Privacy is active.

- **Intercom — Automatic and Dial**

An extension with Data Privacy or Data Restriction active cannot originate an intercom call. The user receives an intercept tone.

- **Music-on-Hold Access**

If a user places a call with Data Privacy on hold, The user must withhold Music-on-Hold to prevent the transmission of tones that a connected data service might falsely interpret as a data transmission.

- **Priority Calls**

If a user activates Data Privacy, Priority Calls are denied on analog voice terminals. However, Priority Calls appear on the next available line appearance on multiappearance voice terminals.

## Data Restriction

---

Data Restriction protects analog-data calls from being disturbed by any of the system's overriding or ringing features.

### How to administer Data Restriction

---

#### Required forms

---

| Form         | Field   | Page                  |
|--------------|---|-----------------------|
| Station      | <ul style="list-style-type: none"> <li>■ Data Restriction</li> <li>— prevent tones = y</li> </ul>       | <a href="#">6-28</a>  |
| Trunk Groups | <ul style="list-style-type: none"> <li>■ Data Restriction (all)</li> <li>— prevent tones = y</li> </ul> |                       |
| — Access     |   | <a href="#">7-150</a> |
| — APLT       |   | <a href="#">7-156</a> |
| — CO         |   | <a href="#">7-168</a> |
| — CPE        |   | <a href="#">7-174</a> |
| — DID        |   | <a href="#">7-178</a> |
| — FX         |   | <a href="#">7-193</a> |
| — ISDN-PRI   |   | <a href="#">7-219</a> |
| — RLT        |   | <a href="#">7-252</a> |
| — Tandem     |   | <a href="#">7-257</a> |
| — Tie        |   | <a href="#">7-262</a> |
| — WATS       |   | <a href="#">7-268</a> |

### Detailed description

---

When you administer Data Restriction to an extension or trunk group, the system cannot gain access to, or superimpose tones onto, the protected call.

Once you administer Data Restriction for an analog or multiappearance voice terminal or trunk group, the feature is active on all calls to or from the terminal or trunk group.

### Considerations

---

- Connections involving one or more digital-data endpoints (data modules) are already protected from receiving system-generated tones. Data Restriction is not needed for these connections.

- Data Restriction applies to both voice and data calls.
- Do not assign Data Restriction to attendant consoles.

## Interactions

---

- Attendant Call Waiting and Call Waiting Termination  
If Data Restriction is active, Call Waiting is denied.
- Busy Verification  
Busy Verification cannot be active when Data Restriction is active.
- Call Vectoring  
Music plays on calls from data-restricted extensions when the calls receive music as the result of a wait-time vector step.
- Intercom — Automatic and Dial  
An extension with Data Privacy or Data Restriction activated cannot originate an intercom call. The user receives an Intercept tone.
- Music-on-Hold Access  
If a user places a call with Data Restriction on hold, The user must withhold Music-on-Hold to prevent the transmission of tones that a connected data service might falsely interpret as a data transmission.
- Priority Calls  
Priority Calls are allowed if the analog station is idle. Call Waiting (including Priority Call Waiting) is denied if the station is busy. However, Priority Calls appear on the next available line appearance on multiappearance voice terminals.
- Service Observing  
A data-restricted call cannot be service observed.

## Data-Only Off-Premises Extensions

---

Data-Only Off-Premises Extensions allows users to establish data calls involving data communications equipment (DCE) or digital terminal equipment (DTE) located remotely from the system site using DATAPHONE digital service or other private-line data facilities.

### How to administer Data-Only Off-Premises Extensions

---

#### Required forms

---

| Form                        | Field | Page                  |
|-----------------------------|-------|-----------------------|
| Data Module Processor/Trunk | ■ All | <a href="#">6-243</a> |

---

### Detailed description

---

A Data-Only Off-Premises Extension uses an on-premises modular trunk data module (MTDM). The system communicates with remote data equipment through the private-line facility linking the on-premises MTDM and the remote data equipment.

The TDM and DCE or DTE constitute a digital-data endpoint. Place data calls to this type of data endpoint using Voice Terminal Dialing or Data Terminal (Keyboard) Dialing. Since there is no voice terminal at the remote site, originate data calls from the remote data terminal using Keyboard Dialing only. If you use computer-generated dialing, you must follow Keyboard Dialing protocol.

### Considerations

---

- Data-Only Off-Premises Extensions provides digital-data endpoints located off-premises through a TDM located on-premises. Communications to or from TDM (and off-premises equipment) must be through an on-premises Processor Data Module or Digital Terminal Data Module. The system does not support communications between two TDMs. Modem Pooling is similar to a TDM, it cannot be used on calls to or from a Data-Only Off-Premises Extension.

## Interactions

---

- Voice Terminal Dialing

An on-premises multiappearance voice terminal may have a Data Extension button associated with the TDM used for a Data-Only Off-Premises Extension. The voice-terminal user and the remote user share control of the data module. Actions of the user at the voice terminal may affect the remote user.

- 1-Button Transfer to Data

The voice-terminal user can transfer a call to the Data-Only Off-Premises Extension. The Data Extension button lamp on the voice terminal lights and the Call in Progress lamp on the data module lights during a data call.

- Data Call Preindication

The multiappearance voice-terminal user presses the idle associated Data Extension button to reserve a data module. The data module is busy to all other users. When the user reserves a data module, the lamp associated with the Data Extension button winks and lights at any other associated voice terminals. A remote user receives the BUSY message when attempting to originate a call.

- Return-to-Voice

To establish a data call, the voice-terminal user presses the associated busy Data Extension button to transfer the call to the voice terminal. The data module associated with the Data Extension button is disconnected from the call. The Call in Progress lamp on the data module goes dark.

## Default Dialing

---

Default Dialing provides data-terminal users who dial a specific number the majority of the time a very simple method of dialing that number. Normal data terminal dialing and alphanumeric dialing are unaffected.

### How to Administer Default Dialing

---

#### Required forms

---

| Form                     | Field                      | Page                  |

|                          | ■ AD Dial Code             |                       |

---

### Detailed description

---

Default Dialing enhances data terminal (keyboard) dialing by allowing a data-terminal user to place a data call to a preadministered destination by either pressing a Return at the DIAL: prompt (for data terminals using DCP data modules) or typing d and pressing Return at the CMD: prompt (for data terminals using ISDN-BRI data modules). The data-terminal user with a DCP data module can place calls to other destinations by entering the complete address after the DIAL: prompt (normal data terminal dialing or alphanumeric dialing). The data-terminal user with an ISDN-BRI data module can place calls to other destinations by typing d, a space, the complete address, and Return after the CMD: prompt.

#### NOTE:

DU-type hunt groups connecting the system to a terminal server on a host computer have hunt-group extensions set to no keyboard dialing.

For the AT command interface supported by the 7400A/7400B/8400B data module, to dial the default destination, enter the ATD command (rather than press return).

## Interactions

---

- Data Call Setup

Default Dialing enhances data terminal (keyboard) dialing by allowing data-terminal users to place data calls to a preadministered destination. Users either press Return at the DIAL: prompt (for DCP) or type d and press Return at the CMD: prompt (for ISDN-BRI).

## Demand Print

---

Demand Print allows voice-terminal users to print their own undelivered messages without calling the message center.

### How to administer Demand Print

## Dial Access to Attendant

---

Dial Access to Attendant allows voice-terminal users to reach an attendant by dialing an attendant-access code. Attendants can then extend the call to a trunk or to another voice terminal.

### How to administer Dial Access to Attendant

---

#### Required forms

---

| Form             | Field               | Page                 |
|------------------|---------------------|----------------------|
| Dial Plan Record | ■ First Digit Table | <a href="#">5-99</a> |

### Detailed description

---

The attendant-access code length is administrable and may be any 1 or 2 digit number; the default is 0. To assign a digit other than 0, enter **attd** in the appropriate row of the First Digit Table, in the Length=1 column. To assign a 2-digit code, enter **misc** in the appropriate row of the First Digit Table on the Dial Plan form. Then complete the Second Digit form for this number. See [“Dial Plan” on page 4-311](#) for more information.

### Interactions

---

- Class of Restriction  
If a voice terminal's COR restricts the user from originating calls, this prohibits the placement of any calls, including Dial Access to Attendant.
- Conference  
If a voice-terminal user calls the attendant by dial access, the attendant cannot add that user to an existing conference.

## Dial Plan

---

This is the system's guide to digit translation. When the system receives dialed digits, it must know what to expect next based on the digits received so far. For example, if a voice-terminal user dials 4, the system must know how many more digits to expect before the call is processed.

A feature access code (FAC) extension or trunk access code (TAC) cannot be assigned to a feature if it is not consistent with the dial plan.

### How to administer Dial Plan

### Detailed description

---

The dial plan provides information to the switch on what to do with dialed digits. Tables define the intended use of a code beginning with a specific first digit or pair of digits. These digits tell the system how many digits to collect before processing the full digit string.

For example, a digit string beginning with 8 may tell the system to wait for 4 more digits because this is the first digit of a 5-digit internal extension. The choices of a first digit are 0–9, \*, and #. Permissible codes and the allowable number of digits are listed below.

- Attendant (ATTD)
- Users can access the attendant group by dialing the single digit 0. Or you can set the Dial Plan Record form so that some other digit is used to access the attendant (for example, 9 is common in Italy). Dial-access numbers to the attendant can range from 0 to 9 with a length of one or more digits. In addition, the system provides for Individual Attendant Access by assigning each attendant an individual extension.
- Dial Access Codes (DAC) — TAC or FAC

TACs or FACs can be from 1 to 4 digits and any number from 1 to 9. For example, 9 could be used for local trunks, 8 for WATS trunks, and 7 for tie trunks. The \* and # can be used as the first digit for TACs. TACs for DCS trunk groups and trunk groups controlled by DCS can be a maximum of 3 digits.
- Extensions (EXT)

Flexible numbering allows 1-, 2-, 3-, 4-, or 5-digit extensions.
- Feature Access Codes (FAC) only

You can use 1 to 4 digits for FACs. If you use \* or # as part of a FAC, they must be the first digit. For example, \* 2 could be used to activate Call Forwarding All Calls and # 2 could be used to deactivate Call Forwarding All Calls. However, you cannot use 2\* or 2#.
- Miscellaneous Code (MISC)

The 1-digit Miscellaneous Code indicates that any dialed digit string starting with the first digit uses the second digit table for interpretation. The associated entry on the second digit table can be a FAC, trunk access code, attendant access code, or extension.
- Prefixed Extensions (PEXT)

The dial plan does not route on the first digit prefix (0 to 9), but routes on the rest of the digits.

You can also administer a Uniform Dial Plan (UDP) as part of the dial plan to be shared among a group of switches. If you establish a UDP, make all extensions the same length (4 or 5 digits). So that calls route to the desired switch, a UDP requires the following information:

- A PBX code, which represents the first 1 to 5 digits of a 4-digit or 5-digit extension and can range from 0 to 9xxxx with a maximum of 50,000 PBX codes on R5r and later or 20,000 PBX codes on R5si/csi and later.
- An RNX, which is associated with the PBX code and is used to select an AAR pattern for the call. This information is required for each PBX code. The 3-digit RNX can be an AAR location code or, for ENP calls, an ENP code.
- A PBX ID (1 to 63), which represents a specific switch (optional).
- Whether or not the PBX code is local to this system (optional).

## Interactions

---

All dial-access features and services provided by the system require the dial plan.

- ISDN-BRI

When an ISDN-BRI station dials sufficient digits to route a call, but the call could route differently if additional digits were dialed, the station does not recognize the Conference or Transfer buttons. The user must delay dialing for 3 seconds or dial # to indicate that the call can be routed based on the digits already dialed. The Conference or Transfer buttons then are recognized and the switch completes the operation.

- MF Signaling

Flexible numbering is supported in countries using R2-MFC trunk signaling without Group II tones. Different-length extensions can exist as long as the extensions have different first digits.

## Distinctive Ringing

Distinctive Ringing provides several ringing cycles to help voice terminal users and attendants distinguish between incoming call types.

### How to administer Distinctive Ringing

#### Required forms

| Form                              | Field                             | Page                  |
|-----------------------------------|-----------------------------------|-----------------------|
| Feature-Related System Parameters | ■ Internal                        | <a href="#">5-123</a> |
|                                   | ■ External                        |                       |
|                                   | ■ Priority                        |                       |
|                                   | ■ Attendant Originating Calls     |                       |
|                                   | ■ Update Transferred Ring Pattern |                       |
| Station (single-line)             | ■ Distinctive Audible Alert       | <a href="#">6-4</a>   |

### Detailed description

You can administer system-wide distinctive-ringing cycles for the three basic call types. Most installations use 1-burst for internal calls, 2-burst for external calls, and 3-burst for priority calls. There are also non-administrable ringing signals for Automatic and Dial Intercom calls, Manual Signaling, and Redirect Notification.

**Table 4-72. Distinctive Ringing Defaults for Country Code 1**

| Default Ringing Cycle                        | Call Type  | User                        |
|--|--|-----------------------------|
| 1-burst ringing (1.2 on, 4.0 off repetitive) | Internal voice terminal, internal tie trunk, and Remote Access | All voice terminals         |
|  | Intercom   | Single-line voice terminals |

*Continued on next page*

**Table 4-72. Distinctive Ringing Defaults for Country Code 1 — Continued**

| Default Ringing Cycle  | Call Type  | User                            |
|--|--|---------------------------------|
| 2-burst ringing (0.2 on, 0.4 off; 0.6 on, 4.0off repetitive)                   | Attendant-extended, attendant-originated, and incoming trunk, including external tie trunk | All voice terminals             |
| 3-burst ringing (0.2 on, 0.1 off; 0.2 on, 0.1 off; 0.6 on, 4.0 off repetitive) | Automatic Callback, Priority Calling, and Ringback Queuing callback                        | Single-line voice terminals     |
| 3-burst ringing (0.1 on, 0.1 off; 0.1 on, 0.3 off; 0.6 on, 4.0 off repetitive) | Automatic Callback, Priority Calling, and Ringback Queuing callback                        | Multiappearance voice terminals |

**Table 4-73. Non-Administrable Signals**

| Default Ringing Cycle                           | Call Type             | User                            |
|---|-----------------------|---------------------------------|
| Unmodulated tone (0.6 on, 4.6 off repetitive)   | Intercom              | Multiappearance voice terminals |
| Single unmodulated tone (0.2 on non-repetitive) | Manual Signaling      | Multiappearance voice terminals |
| Single ring (0.2 on non-repetitive)             | Redirect Notification | All voice terminals             |

**Table 4-74. Non-Administrable Cycles at an Attendant Console for Country Code 1**

| Default Ringing Cycle:                         | Call Type  |
|--|--|
| Low-pitched tone (0.4 on, 1.2 off repetitive)  | Incoming call  |
| High-pitched tone (0.4 on, 1.2 off repetitive) | Attendant recall and anytime a call associated with a timed reminder interval returns to the console |
| Low-pitched tone (0.25 on, 0.8 off repetitive) | Waiting in queue   |

## **Considerations**

---

- The 2- and 3-burst ringing is optional only on single-line voice terminals. If Distinctive Ringing is disabled, the system generates a 1-burst repetitive tone for all incoming calls. This is useful for equipment interfaced by analog lines, especially if you use off-premises station.
- A single distinctive ring cycle is used for each new incoming call to an off-hook voice terminal or headset. The system alerts a CALLMASTER terminal with a single ring cycle whenever either the headset or the handset is plugged into the headset jack.

## **Interactions**

---

- **Personalized Ringing**  
The called party hears the user-selected ringing pattern for the distinctive ring cycles.

## Dual DCP I-Channels

---

Dual Digital Communications Protocol (DCP) I-channels support the use of dual DCP I-channels for AUDIX networking. In this case, networking refers to the ability to send data files between AUDIX systems, not to communications with the switch.

### How to administer Dual DCP I-Channels

---

#### Required forms

---

| Form              | Field | Page                  |
|-------------------|-------|-----------------------|
| Data Module (PDM) | ■ All | <a href="#">6-243</a> |

### Detailed description

---

Each AUDIX has 2 DCP connections and 2 external (EIA 232C) connections that can be used for networking. Each external connection is capable of running one communications session. Data support for both I-channels increases the simultaneous AUDIX networking capacity from 4 ports to 6 ports.

You administer Dual DCP I-Channel data modules as processor data modules (PDMs) with both the primary and secondary data module having the same port location but different extensions.

If the primary data module is a TTI port, the secondary data module cannot be administered because TTI cannot be used on a secondary data module. Similarly, if you already administered the secondary data module, TTI cannot be administered on the primary data module.

### Interactions

---

None

## Emergency Access to the Attendant

Emergency Access to the Attendant alerts an attendant if a station remains off-hook for more than the administered period of time. It also enables a user to place an emergency call to an attendant.

### How to administer Emergency Access to the Attendant

#### Required forms

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Class of Service                  | ■ Off-Hook Alert  | <a href="#">5-81</a>  |

| Attendant Console                 | Feature Button Assignments <ul style="list-style-type: none"> <li>■ — em-acc-att</li> </ul>   | <a href="#">5-35</a>  |
| Feature Access Code (FAC)         | ■ Emergency Access To Attendant Access Code   | <a href="#">5-113</a> |

### Detailed description

Emergency calls can be placed automatically by the system or dialed by system users. Such calls can receive priority handling by the attendant.

Place emergency calls to the attendant in the following ways:

- Automatically by the system

Assign a voice terminal the Off-Hook Alert option via COS. If the terminal is left off-hook until intercept timeout, the (administrable) off-hook alerting timer starts. If the terminal is still off-hook when the timer expires, an emergency call is automatically placed to the attendant.

## 4 Basic Features

### *Emergency Access to the Attendant*

Page 4-319

- Dial access by a system user

A user can place an emergency call to the attendant by dialing the Emergency Access to the Attendant feature-access code.

When an emergency call is placed, one of the available attendants receives visual and audible notification of the call. If all attendants are busy, the call enters a queue for emergency calls. Calls can be administered to redirect to another extension if the queue is full.

An emergency call causes the following to occur:

1. The system selects the first available attendant to receive the call.
2. The attendant hears the emergency tone and sees the lamp associated with the Emergency button, if assigned, light. If the console does not have emergency-tone capability, the attendant hears normal ringing and sees the display flash.
3. The attendant display shows:
  - Calling-party identification
  - Calling-party extension
  - How many emergency calls remain in queue

An attendant can place a normal call on hold to handle an emergency call.

An audit record is created for each emergency call. This record includes:

- Extension where the call originated
- The attendant or attendant group that answered the call
- Time of the call
- The following known call results:
  - Call Completed — Call answered at attendant or LDN night extension.
  - Queue Full — Emergency-access queue is full; tries to redirect the call to an emergency-access redirection extension.
  - No Attd — No active attendants are available to receive the call; tries to redirect the call to an emergency-access redirection extension.
  - Redirected Answered — Call is answered by the emergency-access redirection extension.
  - No Redirection Ext. — Could not redirect the call to the emergency-access redirection extension because none are administered.
  - Attd Night Service — System is in night service. Will try to redirect the call to attendant night service.

## 4 Basic Features

### *Emergency Access to the Attendant*

Page 4-320

- Failed — Caller drops the call before it can be answered. Call was either waiting in the attendant emergency queue, ringing at an attendant console, or ringing at the LDN night extension.
- Redirected Abandoned — Caller drops the call before it can be answered. Call had been redirected to the emergency-access redirection extension.

You can generate an Emergency Access Summary Report of the emergency audit records. Schedule the report for printing once a day at a designated printer. If the switch has a journal printer Emergency Access to the Attendant audit records print as the calls occur.

You can monitor emergency-access calls by displaying them at the administration terminal. The command for listing emergency call events is **list emergency**. You can use a from and to time option with the command. For example, if the command **list emergency 8:00am 12:00pm** was entered, those emergency call events display on the management terminal.

## Considerations

- The Emergency tone cannot be silenced except by answering the emergency call.
- The system should have at least one day and one night attendant (or night service station) for this feature to be useful at all times.

## Interactions

- Centralized Attendant Service

For a branch with CAS in effect, an emergency call reroutes to the branch attendant group. If the branch does not have an attendant or if the branch is not in CAS Backup Service, the call is denied.

If the branch PBX is in CAS Backup Service, an emergency call routes to the backup position and is handled as any other nonemergency call.

- COR

An Emergency Access to the Attendant call overrides all restrictions on the COR.

- Individual Attendant Access

An emergency call cannot be placed to an individual attendant.

Emergency calls have priority over other calls to an individual attendant, only if they are assigned a higher priority on the Console Parameters form.

- Intercept Treatment

Intercept With Off-Hook Alert automatically activates Emergency Access to the Attendant.

## 4 Basic Features

### *Emergency Access to the Attendant*

Page 4-321

- Inter-PBX Attendant Service

For branches with Inter-PBX Attendant Service in effect, an emergency call reroutes to the local attendant group. If the branch does not have an attendant or if the attendant is not on duty, the call is denied.

- Night Service

When Night Service is in effect, emergency calls route to the night destination. Such calls are included on the Emergency Audit Record, and the call is designated as Emergency Night in the audit trail.

When an attendant is in night service, you must assign either a night station or a redirect extension. Otherwise emergency calls to the night attendant hear a busy tone.

- Priority Queue

You can change the priority of emergency calls to equal or lower than that of other types of calls.

- Remote Access

An emergency call cannot be placed through Remote Access.

- Restriction — Controlled

An emergency call overrides any controlled restriction.

## Enhanced Voice Terminal Display

---

The Enhanced Voice Terminal Display feature allows you to choose the character set that you want to see in DEFINITY ECS softkeys and display terminals. In addition to the standard Roman character set, you can choose either Katakana or European characters.

The feature supports two groups of enhanced character display sets. The set that you use is determined by the terminal type, and not by administration.

- Group1 (default) contains the Roman alphabet, numerals, and special characters found on the standard US English keyboard.
- Group2 contains one of two alternate character sets:
  - Group2a contains Katakana characters as well as some European characters and other symbols.
  - Group2b contains characters required to display many European languages.

### How to administer Enhanced Voice Terminal Display

---

You activate this feature on a system-wide basis as described below.

#### Task 1

To administer voice terminal displays in Group 2 characters, A Lucent Technologies employee must enter **y** in the following field.

#### Required forms

| Form                                 | Field                             | Page                  |
|--------------------------------------|-----------------------------------|-----------------------|
| System Parameters<br>Country-Options | ■ Enhanced 84xx Terminal Display? | <a href="#">5-271</a> |

#### Task 2

You can now enter the Roman characters that produce the corresponding Group2 characters on the terminal display.

The system accepts entries as Roman characters preceded by a tilde (~), and maps them to corresponding Katakana or European characters. (You can still enter Roman characters after you have activated this feature, just as you normally would.)

Once you have activated the feature, add or update the fields that you want to display using the Group 2 character set.

1. Retrieve the appropriate form.
2. Move to the display field that you want to add or change.
3. Enter a tilde (~) where you want to start the display in Group2 characters. See [Table 4-75](#), [Table 4-76](#), and [Table 4-77](#) for Group1 to Group2 character-map information. Use the character map on the following pages to determine the Roman characters that correspond to the Group2 characters you want.
4. Type the Roman characters in the display field.
5. If you want to end the display of Group2 characters and continue with Roman characters, type another tilde, then continue using the Roman set. If you want the entire field to display in Group2 characters, you can omit the tilde from the end of the field.
6. Submit the form.

### How to combine Katakana characters

The Katakana characters that combine symbols do not appear as single characters in the terminal-display set. To display these characters, you must use a combination of characters.

[Table 4-75](#) shows a few examples of what you enter to display these characters.

**Table 4-75. Examples of how to combine characters**

| When you enter these characters | This displays on the voice terminal |
|---------------------------------|-------------------------------------|
| ~2<@^                           | ÒÃàP                                |
| ~2<@^~, Max                     | ÒÃàP, Max                           |
| ~N_                             | îß                                  |
| Pe~n~a                          | Peña                                |
| Fr~a~ulein                      | Fräulein                            |

Characters appear on the display terminal in the order in which you enter them. If you want the display to read right to left, enter the characters in reverse order on the form.

### Considerations

If you turn the feature off at the system level after Group2 display has been administered, you must change the display field values back to the appropriate Group1 characters.

## What terminal types can you use?

Whether your system displays Group2a or Group2b depends on the terminal types attached to the ECS. Each character set for Enhanced Voice Terminal Display requires specific firmware in the terminal, based on the Group2 character set that you want to display.

### NOTE:

It is very important to use terminals with the same firmware type across your entire system. That is, use only Group2a *or* Group2b terminals. Otherwise, the displays will not appear as expected. Your Lucent Technologies representative can ensure that you have the firmware types appropriate for your system.

## Trouble Shooting

| Symptom   | Cause and Solution  |
|---|---|
| Characters that display are not what you thought you entered.                           | This feature is case sensitive. Check the table to make sure that you entered the right case.   |
| You entered “~c”, and “*” appears on the display instead.                               | Lower-case “c” has a specific meaning in the DEFINITY system, and therefore cannot be mapped to any other character. An asterisk “*” appears in its place.  |
| You entered “~->” or “~<-” and nothing appears on the display.                          | These characters do not exist as single keys on the standard US-English keyboard. Therefore the system is not programmed to handle them.  |
| Enhanced display characters appear in fields that you did not update.                   | If an existing display field contains a tilde (~) followed by Roman characters, and you update and submit that form after this feature is activated, that field will display the enhanced character set.                        |
| Nothing displays on the terminal at all.  | Some unsupported terminals do not display anything if a special character is presented. Check the model of display terminal that you are using.   |
| You entered a character with a descender and part of it appears cut off in the display. | Some of the unused characters in Group2a have descenders that do not appear entirely within the display area. These characters are not included in the character map. For these characters (g,j,p,q,y), use Group1 equivalents. |

## Interactions

---

### Internal feature interactions

- Data Call Setup

Not supported.

- Directory

The Enhanced Voice Terminal Display feature interacts with the Directory feature to include names administered with enhanced display characters in the directory. Terminal users can select directory entries displayed in the Group2 character set by using the Directory and Next buttons on their display terminals, and can use the "\*" to indicate special characters in a directory search. However, they cannot input directory entries using the voice terminal because of the special characters used.

- ISDN

The system supports enhanced display characters for ISDN calls. These characters display correctly for calls between properly administered DEFINITY switches with the same terminal types at both ends.

- Leave Word Calling — Adjunct

Not supported

- Message Retrieval — Print Messages (Demand Print)

Not supported

- OSSI

OSSI displays the literal value of the display field, not the Group2 characters.

- Voice Terminal Display

If the terminal hardware is compatible, all features that display administered data are supported for enhanced display.

### External feature interactions

- Adjunct Switch Applications Interface (ASAI)

Information sent from the DEFINITY ECS to any adjunct is the literal value of the field as administered, not the enhanced display format. Because the adjunct has no way to interpret this into special fonts, the resulting display appears as a string of random characters — for example, as "2<@^."

The ASAI-Query Names Database and ASAI-Accessed BCMS Data features also receive names as described above.

## 4 Basic Features

### Enhanced Voice Terminal Display

Page 4-326

#### ■ AUDIX

The following AUDIX products operate normally with Enhanced Voice Terminal Display enabled:

- Basic R1 AUDIX
- Embedded DCIU AUDIX
- Embedded DCP AUDIX (requires R3.2 or greater)

#### ■ AUDIX Voice Power/AUDIX Voice Power Lodging

Not supported

#### ■ DCS

This feature is supported in a DCS environment. All switches in the network must have the enhanced character set enabled *and must have* the same software load installed on each server and terminals with the same firmware type.

#### ■ ECMA and QSIG Networking

If two DEFINITY servers are administered for enhanced display for terminals using the same character group, this feature is supported. It is not supported between a DEFINITY ECS and a non-DEFINITY switch.

#### ■ Look Ahead Interflow

This feature can use the enhanced character set, but terminal firmware must match the administered display group.

#### ■ Monitor 1 and OneVision

Monitor 1 and OneVision receives ASCII characters as administered.

#### ■ Novell Telephony Services

Not supported

## Extended User Administration of Redirected Calls

---

Extended User Administration of Redirected Calls allows system users to change their lead-coverage path or their call forwarding from any local (on-site) or remote (off-site) location.

### How to administer Extended User Administration of Redirected Calls

---

#### Required forms for allowing a change to Call Forwarding

### Detailed description

---

This feature does not change Call Coverage, nor does it change Call Forwarding All Calls or the Call Forwarding Busy/Don't Answer. It merely allows users to select between one of two previously administered coverage paths or to change their forwarding from any on-site or off-site location.

4 Basic Features

Extended User Administration of Redirected Calls

**Telecommuting access extension**

The telecommuting access extension allows users to use Extended User Administration of Redirected Calls from off-site. If you want to quickly disable the feature for *all* users, change the Telecommuting Access Extension to blank.

If you are operating in a DCS environment, you need to assign a different telecommuting-access extension to each switch and tell your users which extension they should use. Users can use Extended User Administration of Redirected Calls from any of the DCS nodes, but they need to dial the telecommuting-access extension of the node on which their station is defined before using the feature access code.

**Extended User Administration of Redirected Calls and COS and COR**

[Table 4-78](#) shows the relationship between COS and a user's ability to use call forwarding at the user's station without a security code or from any on-site or off-site location with a security code.

**Table 4-78. COS and Extended User Administration of Redirected Calls of Call Forwarding**

| If the user's COS are set to these values |                   |                                    |   | Then the user's call forwarding capability is                      |  |
|---|-------------------|------------------------------------|---|--|--|
| Call Fwd All COS                          | Call Fwd B/DA COS | Extended Call Fwd Activate All COS | Extended Call Fwd Activate Busy D/A COS | Users can forward calls from their station without a security code | Users can forward calls from their station or from another location with a security code |
| Yes                                       | Yes               | Yes                                | Yes                                     | Yes  | Yes  |
| No  | No                | Yes                                | Yes                                     | No   | Yes  |
| Yes                                       | Yes               | No                                 | No                                      | Yes  | No   |

**COR**

COR controls the use of the change coverage option of Extended User Administration of Redirected Calls. This means that, if the *Can Change Coverage* field on the COR form is set to **y**, users with that COR can use the Change Coverage FAC to change their coverage option. If the field is set to **n**, the user cannot use the Change Coverage FAC.

**End-user procedures**

These user procedures describe both on- and off-site use of the feature.

**Table 4-79. How to use Extended User Administration of Redirected Calls to change Call Coverage or activate Call Forwarding from an on-site location**

| User entry   | System response  | Explanation   |
|--|--|---|
| 1. Change Coverage FAC, Extended Call Fwd Activate Busy D/A FAC, or Extended Call Fwd Activate All FAC | <ul style="list-style-type: none"> <li>■ Dial tone</li> <li>■ Intercept tone</li> </ul>  | <p>The system is prompting for the extension.</p> <p>The user entered an FAC not defined in the system or not allowed for this user.</p>  |
| 2. Extension followed by #, or only a #  | <ul style="list-style-type: none"> <li>■ No response</li> </ul>  | The single # refers to the extension at which the user is entering data.  |
| 3. SSC for the extension entered in step 2, followed by #  | <ul style="list-style-type: none"> <li>■ Dial tone</li> <li>■ Intercept tone</li> </ul> <p>(Note: If the user has a display voice terminal, it does display the SSC or the #.)</p> | <p>The system is prompting for more information.</p> <ul style="list-style-type: none"> <li>■ The user requested an extension that does not allow extended forwarding or does not allow change coverage in its COS.</li> <li>■ The user has entered an invalid or untranslated extension. This is logged as an invalid attempt.</li> <li>■ The user entered an extension that has an inaccessible tenant partition number for the tenant partition number of the dialing station.</li> <li>■ SSC is invalid for the extension. This is logged as an invalid attempt.</li> <li>■ Interdigit timeout has occurred.</li> </ul> |
| 4. The forwarded-to extension  | <ul style="list-style-type: none"> <li>■ Confirmation tone</li> <li>■ Intercept tone</li> </ul>  | <p>Forwarding is successful.</p> <p>The extension is not valid.</p>   |
| 5. The digit 1 or 2 for the first or second coverage option  | <ul style="list-style-type: none"> <li>■ Confirmation tone</li> <li>■ Intercept tone</li> </ul>  | <p>The request is successful — the coverage option changed.</p> <p>The user did not enter 1 or 2.</p>   |

**Table 4-80. How to use Extended User Administration of Redirected Calls to deactivate Call Forwarding from an on-site location**

| User entry  | System response   | Explanation   |
|---|---|---|
| 1. The Extended Call Fwd Deactivation FAC                 | <ul style="list-style-type: none"> <li>■ Dial tone</li> <li>■ Intercept tone</li> </ul> | <p>The system is prompting for the extension.</p> <p>The user entered an FAC not defined in the system or not allowed for this user.</p>  |
| 2. Extension followed by #, or only a #                   | <ul style="list-style-type: none"> <li>■ No response</li> </ul>                         | <p>The single # refers to the extension at which the user is entering information.</p> <p>If the user is at a voice terminal with a display, the # is the last character that the user sees until the command sequence is complete, unless the station is a BRI station. If it is a BRI station, all characters are visible.</p>  |
| 3. SSC for the extension entered in step 2, followed by # | <ul style="list-style-type: none"> <li>■ Dial tone</li> <li>■ Intercept tone</li> </ul> | <p>Call Forwarding is cancelled.</p> <ul style="list-style-type: none"> <li>■ The user has requested an extension that does not allow extended forwarding in its COS.</li> <li>■ The user has entered an invalid or untranslated extension. This is logged as an invalid attempt.</li> <li>■ The user entered an extension that has an inaccessible tenant partition number for the tenant partition number of the dialing station.</li> <li>■ SSC is invalid for the extension. This is logged as an invalid attempt.</li> <li>■ Interdigit timeout has occurred.</li> </ul> |

### Using this feature from an attendant or console-permissions station

This operation is the same as that described for a user, except that console-permissions stations and attendants do not need to enter a station security code, nor do they need to press the pound key (#).

## How to use Extended User Administration of Redirected Calls FAC from an off-site location

To use Extended User Administration of Redirected Calls from off-site, a user must first access the telecommuting-access extension. If the user is making the request via DID, the user must precede the extension with the correct public-network prefix. If the user is making the request via a trunk group dedicated to remote access of this feature, the user must dial the public-network number for the trunk group.

The system provides dial tone after the user accesses the telecommuting access extension. At that point the user can enter only one of the four FACs associated with this feature. The four FACs associated with Extended User Administration of Redirected Calls are:

- Extended Call Fwd All Activate
- Extended Call Fwd Busy D/A Activate
- Extended Call Fwd Deactivation
- Change Coverage

When the system provides dial tone, the user can proceed with the steps outlined for on-site use of the feature in [Table 4-335](#).

## How to interrupt the command sequence

To interrupt the command sequence and begin again, the user can enter an asterisk (\*) at any point before the second pound sign. The system provides dial tone, and the user can begin the command sequence at the point of entering the user's extension. (The user should not enter the FAC again.) The interrupted command sequence is not recorded as an invalid attempt.

## Security

---

### SECURITY ALERT:

*Invalid extensions and invalid station security codes are logged as security violations. The extension or incoming trunk from which the command sequence was dialed, the FAC, and the dialed command string appear on the Monitor Security-Violations Station Security Codes screen or report if Security Violation Notification is enabled.*

To track security violations, see [“Security Violation Notification” on page 4-531](#) for administration information.

## Considerations

---

- The Station Status screen shows the station's active lead-coverage path (1 or 2).

## Interactions

---

- Administered without Hardware  
Extended User Administration of Redirected Calls is allowed for AWOH extensions.
- Bridged Appearance  
When the pound key (#) is pressed from a bridged appearance immediately following any of this feature's four FACs, the system assumes that the currently active bridged extension will be administered. The station security code of the currently active bridged extension must be entered after the initial # to successfully complete the command sequence.  
  
If the station has only bridged appearances, the station's extension must be dialed after the FAC to successfully complete the command sequence, since the station's extension is not associated with any appearances.
- Call Coverage  
Extended User Administration of Redirected Calls interacts with this feature only in that system users can change their lead-coverage path.  
  
An attempt to activate Send All Calls is denied if the currently active coverage path does not allow Send All Calls in its coverage criteria. However, if users activate Send All Calls when it is allowed, and then change their coverage path to one that does not allow Send All Calls, the Send All Calls button remains lit and Send All Calls automatically resumes if the user changes back to the coverage path that allows it.
- Call Forwarding  
When Call Forwarding is active, the status lamps for the active features for that extension are lit. When Call Forwarding is deactivated, the status lamps for both Call Forward All and Call Forward Busy/DA buttons for that extension are extinguished. Off-net forward destinations are not allowed.
- Distributed Communications System  
Assign a different telecommuting access extension for each switch. System users can use Extended User Administration of Redirected Calls from any of the DCS nodes, but they dial the extension of the node on which their station is defined before dialing the FAC.

**4 Basic Features**

*Extended User Administration of Redirected Calls*

*Page 4-339*

- **Security Violation Notification**

Extended User Administration of Redirected Calls security violations are tracked and reported by SVN for station security codes, if it is enabled.

- **Tenant Partitioning**

The telecommuting access extension is always automatically assigned to Tenant Partition 1, so that it can be accessed by all tenants.

The tenant number of the extension being administered must be accessible by the tenant number from which the Extended User Administration of Redirected Calls FAC is being dialed or the request is denied. If the FAC is being dialed on site, the tenant number of the station or attendant must have access to the tenant number of the extension being administered. If the FAC is being dialed off site, the tenant number of the incoming trunk must have access to the tenant number of the extension being administered.

## External Device Alarming

---

External Device Alarming allows you to assign analog ports to alarm interfaces for external devices. You can specify a port location, information to identify the external device, and the alarm level to report when a contact closure occurs.

You can designate the alarm condition for an external device as major, minor, or warning. External Device Alarming is supported on all analog-line circuit packs that are supported by DEFINITY ECS.

For more information, see *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6r* or *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6vs/si* or *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6csi* for your system type.

None

## Facility Busy Indication

---

Facility Busy Indication provides multiappearance voice-terminal users with a visual indication of the busy or idle status of one of the following system resources:

- An extension number
- A trunk group
- A terminating extension group
- A hunt group (either DDC or UCD)
- Any loudspeaker paging zone, including all zones

The Facility Busy Indication button provides the attendant or user with direct access to the extension number, trunk group, or paging zone.

You can store extension numbers, trunk group access codes, and Loudspeaker Paging access codes in a Facility Busy Indication button.

---

### Detailed description

---

An attendant or a voice-terminal user can have one or more Facility Busy Indication buttons. The Facility Busy Indication buttons can be used in two ways:

- When users need to know the status of a resource, they press the appropriate Facility Busy Indication button. The system then automatically selects an idle call appearance and places a call to the resource. If the resource is idle, the lamp remains lit until you disconnect from the resource.
- If a user has not pressed the Facility Busy Indication button and the lamp lights, the resource is busy. If the lamp flashes, the resource is placing a call to the attendant or voice terminal who is tracking the resource. The attendant, and more than one voice terminal, can track the same resource.

An attendant can store extension numbers, trunk group access codes, and Loudspeaker Paging Access codes in a Facility Busy Indication button.

4 Basic Features

*Facility Busy Indication*

Page 4-342

The system updates the status of the tracked resource within five seconds of detecting the change.

The Facility Busy lamp indication for a VDN does not light when the VDN is being used. The associated button may be used to place a call to a VDN.

## Considerations

---

- It is possible that an incoming call that causes the lamp to flash may go unanswered. Here is the situation in which that can occur. If the lamp represents the status of a trunk group, and all trunks in the trunk group become busy before the flashing call is answered, the system lights the lamp steadily to indicate that all trunks are busy. When a trunk in that trunk group becomes idle, the system turns off the busy indication and the lamp goes dark. In this situation, the call has not been answered or dropped, even though the lamp flashed, lit steadily, and went out.
- A voice terminal user cannot use this feature to monitor the status of the attendant console.

## Interactions

---

None

## Facility Test Calls

---

You can place Facility Test Calls from a voice terminal to test specific trunks, DTMF receivers, time slots, and system tones. Lucent Technologies remote maintenance personnel can make test calls from remote locations. Four types of Facility Test Calls are available:

- Trunk — To test specific tie or CO trunks. You cannot test DID trunks with this feature. Your Class of Restriction (COR) must allow you to use the Facility Access Trunk Test option.
- DTMF receiver — To test the DTMF receivers located on a tone detector or call classifier/tone detection circuit pack.
- Time slot — To test a specific time slot on the time division multiplex buses or out-of-service time slots.
- System tone — To test a specific system tone.

*DEFINITY Enterprise Communications Server Release 5 Maintenance for R5vs/si, DEFINITY Enterprise Communications Server Release 5 Maintenance for R5r, and DEFINITY Enterprise Communications Server Console Operations* contain more information.

### How to administer Facility Test Calls

---

#### Required forms

| Form                      | Field  | Page                  |
|---------------------------|--|-----------------------|
| Feature Access Code (FAC) | ■ Facility Test Calls Access Code            | <a href="#">5-113</a> |
| Class of Restriction      | ■ Facility Access Trunk Test                 | <a href="#">5-72</a>  |
| Station (multiappearance) | ■ Feature Button Assignments<br>— trk-ac-alm | <a href="#">6-14</a>  |

### Security

---

Proper administration of Facility Test Calls minimizes the ability of unauthorized persons to gain access to the network. However, it is your responsibility to properly implement the feature, evaluate and administer the various restriction levels, protect access codes, and distribute the codes only to individuals who have been advised of the sensitive nature of the access information. Each authorized user should be instructed in the proper use and handling of access codes.

In rare instances, unauthorized individuals use Facility Test Calls to connect to the public switched network. Applicable tariffs require that the customer pay all network charges for such calls. Lucent Technologies, Inc., cannot be responsible

for charges incurred by such calls, and will not make any allowance or give any credit for charges that result from unauthorized access.

To help secure this feature from unauthorized use, take the following steps:

- Remove the access code when not in use.
- Change the access code from the factory default.
- Secure records of the access code.
- Use COR to restrict which users can use the access code.

You can set Logoff Notification to notify you at logoff if Facility Test Calls is still enabled. This notification guards against inadvertently leaving Facility Test Calls active. It can also alert the you to unauthorized feature activation.

Consult the *BCS Products Security Handbook* for additional steps to secure your system.

## Considerations

---

You must use a touch-tone phone that resides on the local switch to make test calls.

## Interactions

---

- Service Observing  
You cannot use Facility Test Calls for Service Observing.

## Flexible Billing

---

Flexible Billing allows DEFINITY ECS or an adjunct to communicate with the public network using ISDN PRI messages to change the billing rate for an incoming 900-type call. Rate-change requests to specify a new billing rate can be made anytime after a call is answered and before it disconnects.

Flexible Billing is available in the U.S. for use with AT&T MultiQuest<sup>®</sup> 900 Vari-A-Bill<sup>™</sup> Service. Flexible billing requires a CallVisor Adjunct-Switch Application Interface (ASAI) and customer-supplied application software.

### How to administer Flexible Billing

---

Display the System-Parameters Customer-Options form and ensure that Flexible Billing and ISDN-PRI are set to **y**.

### Detailed description

---

All change requests are initiated by an adjunct processor (CPE host or VRU) connected to the DEFINITY ECS. The customer-provided application on the adjunct processor tells the adjunct when to request a rate change. The billing rate can be changed to any of the following:

- New rate
- Flat rate (not dependent on length of call)
- Premium charge (a flat charge in addition to the existing rate)
- Premium credit (a flat negative charge in addition to the existing rate)
- Free call

There is never a negative charge for calls. During provisioning process, a maximum rate is set for each 900 number.

You might want to change the billing rate for a call in progress when you want:

- A new rate for valuable services such as requests for limited-access information, conversion of text mail to speech, or technical support.
- A flat rate for consultant support, warranty registration, maintenance contracts, or recovery of a fixed-cost service or product.
- A premium charge for callers who need specialized delivery of information such as overnight mail or FAX, or to recover the cost of a sample product, account summary, or transcript.
- A premium credit applied for promotional discounts, first-time callers, contest winners, or those who use low-overhead resources such as electronic media rather than human agents.

Flexible Billing operates as follows:

- An incoming PRI call from the network contains a message that a call can or cannot use the AT&T MultiQuest 900 Vari-A-Bill Service.
- This information is passed to the adjunct processor using ASAI messaging or to the PRI VRU adjunct.
- The adjunct is informed of the Flexible Billing capability of a call only if the called VDN, split, or agent is included in a monitored domain for which notification has been requested by that adjunct processor.
- Success and failure results from the request are returned to the adjunct.

Subsequent change requests can be made for a call that has already had a rate change. In this case:

- If the original and subsequent requests were flat charge or new rate, the previous change is overwritten.
- If the original request was premium charge or premium credit, the subsequent request must be either premium charge or premium credit.

In any case, the new rate is effective from the time the original change took effect.

The system can handle a limited number of change requests. See the *DEFINITY Enterprise Communications Server System Description Pocket Reference* for capacities information.

## Considerations

---

Cellular end offices and some other end offices (NPA-NXX) do not have the necessary billing software to accept rate changes. If you receive a large percentage of calls from specific exchanges, geographical areas, or cellular callers, do a careful analysis before using Flexible Billing.

Before changing the caller rate, you must inform callers of the new rate and get their agreement.

## Interactions

---

- Call Detail Recording  
If the User Data item is being recorded, the count for this item increases when you use Flexible Billing.
- Call Vectoring  
Incoming Flexible Billing calls can use Call Vectoring for routing.  
If a VDN Return Destination is assigned and Flexible Billing is active for a call, the return destination is ignored and the call disconnects.

- Conference

If a call arriving on a trunk that supports Flexible Billing is conferenced with a call from a trunk that does not support Flexible Billing, the switch sends billing change requests to the trunk that supports Flexible Billing. If calls are conferenced from trunks that both support Flexible Billing, only one trunk is sent billing change requests.

**NOTE:**

Do not conference calls from two or more incoming Flexible Billing trunks.

- Transfer

If a call is answered by a party on the local switch and is transferred to a second switch, the second switch does not receive an indication that the call has Flexible Billing. However, Flexible Billing is available when a call is transferred to another monitored domain on the same switch.

## Go to Cover

---

Go to Cover allows users who call another internal extension to send the call directly to coverage.

### NOTE:

Go to Cover cannot be activated for calls placed to a Vector Directory Number extension. Go to Cover can be used to force a call to cover to a VDN if the called principal has a VDN as a coverage point.

Go to Cover can be used only if the called party is assigned a call-coverage path. The called party must have alternate answering positions assigned.

To activate Go to Cover, press the Go to Cover button after the call is ringing. Intercom — Automatic, Intercom — Dial, and Priority Calling redirect to coverage when the caller presses the Go to Cover button.

## How to administer Go To Cover

---

### Required forms

---

| Form                       | Field   | Page                 |
|----------------------------|---|----------------------|
| Station (multi-appearance) | ■ Button/Feature Button Assignments -goto-cover | <a href="#">6-14</a> |

---

## Group Listen

---

Group Listen allows voice terminal users to talk and listen to another party with the handset or headset while the 2-way speakerphone is in the listen-only mode. Others in the room can listen, but cannot speak to the other party via the speakerphone. The person talking on the handset acts as the spokesperson for the group. Group Listen provides reduced background noise and improves clarity during a conference call when a group needs to discuss what is being communicated to another party.

### How to administer Group Listen

---

1. On the first page of the 6400 Station form, enter **grp listen** in the *Speakerphone* field.
2. Submit the change.

### Detailed description

---

Group Listen works with 6408+, 6408D+, 6216D+, and 6424D+ voice terminals. To activate Group Listen, the user picks up the handset, places the call, and while actively talking/listening, presses the speaker button. Users with a headset plugged into their terminal (and a handset on-hook) activate Group Listen the same way. The headset is then in the talk/listen mode and the speakerphone is in the listen-only mode.

**Table 4-81. User interactions with Group Listen**

| Action while in Group Listen                               | Result  |
|--|---|
| Press speaker button while using a headset or handset only | Speakerphone is turned off and handset or headset remains in talk/listen mode |
| Hang up handset before 10 seconds pass                     | Call remains active and speakerphone goes into talk/listen mode               |
| Hang up handset after 10 seconds                           | Call terminates and speakerphone is turned off                                |
| Press Drop button anytime                                  | Call terminates, handset and speakerphone hear dialtone                       |
| Plug in headset when handset is active                     | Ignored   |

---

*Continued on next page*

**Table 4-81. User interactions with Group Listen — Continued**

| Action while in Group Listen            | Result  |
|---|---|
| Unplug headset while handset is active  | Ignored   |
| Unplug headset while handset is on-hook | Group Listen is deactivated and speakerphone goes into talk/listen mode |
| Off-hook alerting messages              | Ignored   |

See *6400-Series Single-Line Telephone User's Guide* (555-230-738) and *6400-Series Multi-Line Telephone User's Guide* (555-230-739) for more information about user interactions.

### To transition from Group Listen to 2-way speakerphone

- For Handset

If users are active on a call in Group Listen with the handset off-hook, and, after 10 seconds want to use the speakerphone for 2-way communication without dropping the call, they:

1. Press the speaker button, causing the handset to be in talk/listen mode and the speakerphone disabled
2. Press the Speaker button, causing Group Listen to activate
3. Within 10 seconds, hang up the handset, causing the handset to deactivate and the speakerphone to be 2-way

- For Headset

If users are active on a call in Group Listen with the handset on-hook, and, after 10 seconds want to use the speakerphone for 2-way communication without dropping the call, they:

1. Press the Speaker button, causing the headset to be in talk/listen mode and the speakerphone disabled
2. Press the Speaker button, causing Group Listen to activate
3. Within 10 seconds, press the Headset button, causing the headset to deactivate and the speakerphone to be 2-way

## Considerations

---

### **SECURITY ALERT:**

*To avoid legal issues in some states or countries, Group Listen users should alert the other party when others are listening to a conversation.*

## Interactions

---

- Conference/ Transfer/Hold

If the user pushes the Conference, Transfer or Hold button while in Group Listen mode, the group that is listening hears what the handset user is hearing.

## Group Paging

---

Group Paging allows a user to make announcements to groups of stations. The announcements are broadcast and they automatically turn on a station's speakerphone. This feature is especially useful when real-time announcements need to be made to several members of a group. A user dials a paging extension and the speakerphones of all idle members of a group are activated with a listen-only capability. The user delivers a message to the group and the group members hear the message. Group members cannot respond to the user during a page.

### How to administer Group Paging

---

1. At the system administration terminal (SAT), enter **add group-page x** (where **x** is the number of the page group to be added).  
You receive the form, Group Paging Using Speakerphone.
2. In the `Group Extension` field, enter the extension to be dialed when using the page group.
3. In the `Group Name` field, enter the name that the display will show when calling the page group.
4. In the `COR` field, enter the class of restriction.
5. Submit your changes.

Paging can now be used. If you wish to view all or some of the page groups, at the SAT, enter **list group-page**.

The maximum number of paging groups in a system is 32 and the maximum number of members allowed in a paging group is 32.

#### NOTE:

You can administer a group paging button to any DCP terminal. The `Number` field represents the extension of the page group, not the group paging number (1 - 32). You can enter the entire group paging extension or assign a range of extensions that relate to a group paging extension. For example, extensions 4001 - 4032 are group page extensions for groups 1 - 32. You can enter 40 in the `Number:` field so that you only need to recall the last two representative digits of the page group (01, 02, 03, etc.).

## Detailed description

---

You use a new form, Group Paging Using Speakerphone, to administer a paging group. You can add a station to multiple paging groups.

An extension in a paging group does not hear the announcement if the paging group member:

- Is active on an appearance and using the speakerphone
- Is active on an appearance and using the handset
- Has a ringing call appearance
- Is using Send All Calls
- Is using Do Not Disturb
- Is off-hook

### NOTE:

When a group member does not hear the announcement for any of these reasons, the caller is not notified. Therefore, if it is important for everyone to hear your announcement, you should check with the people in the group to make sure that they received it. If none of the group members hear the announcement for any of these reasons, the caller receives a busy signal.

The people being paged can only listen to the page over the speakerphone or handset and cannot respond to the person making the page. A paging group member can drop the call by disconnecting.

The ability to initiate a group page is restricted on a per-station basis via the COR feature. All DEFINITY features that use the COR are subject to this restriction. This includes, but is not limited to: trunks, digital stations, analog stations, and BRI stations. Any station that wishes to initiate a page group must have permission to call the COR of the page group. Otherwise, the ability to page that group is denied.

Pages can be made to the following phones with speaker capability: 6400-series, 7406D, 7406+, 7407D, 7407+, 7410+, 7444, 8403B, 8405B/B+, 8405D/D+, 8410B, 8410D, 8411B, 8411D, and 8434D.

### NOTE:

See *6400-Series Single-Line Telephone User's Guide* (555-230-738) and *6400-Series Multi-Line Telephone User's Guide* (555-230-739) for more information about user interactions.

## Considerations

---

### Security Considerations

Because of the nature of this feature, use caution when disseminating sensitive information. The page initiator is responsible for the range of people who could inadvertently listen to the page on a neighboring phone.

Enter class of restrictions (CORs) on the VDN and Trunk Group forms as needed for your protection. This enables/disables VDNs and trunk groups from making page calls.

### Interactions

---

- Attendant Intrusion

The attendant cannot intrude onto an ongoing group page call. If the attendant attempts to intrude onto a page group, the attendant receives intercept tone. If the attendant tries to intrude onto the paging originator, the intrusion attempt succeeds. However, all group page members are able to hear both the paging originator and the attendant.

- Auto Exclusion and Manual Exclusion

Bridged appearances are not allowed on the page. Therefore, the Auto Exclusion and Manual Exclusion features are disabled. If the manual exclusion button is pressed, it is ignored. Auto Exclusion does not activate because there are no bridged appearances alerted when the page terminates.

- Auto Hold

Auto Hold does not put a group page call on hold. The group page call is dropped and the incoming call is answered.

- Automatic Callback

Automatic Callback is disabled when calling an active page group. Auto Callback functions normally when calling a single member of the page group or the page originator. Automatic Callback functions normally when a page member activates Auto Callback and subsequently receives a group page call. The origination of a page results in either a successful page or a busy signal. If the page originator presses the automatic callback button when calling a busy page group, reorder tone is received.

Automatic Callback functions normally if the target extension is a single member of the page group or the page originator. If the target extension is a member of the page group, when the page is disconnected from that particular station, the callback works normally.

- Bridging

Bridging is disabled on this feature. A bridged appearance of a group member does not receive any indication of a call when the page arrives. The bridged appearance cannot bridge onto the page. If the bridged appearance attempts to bridge onto the page, intercept tone is received.
- Call Coverage

A page call does not follow a coverage path on a paged member. A page group cannot be a coverage point. The group page does not go to coverage if the group member is not there. For that group member, the page either terminates at the station or does not terminate at all.
- Call Park

Group members who receive a page cannot park the call. If the call park button is pressed by a page group member while listening to a page, the button press is ignored and the page continues normally.
- Call Pickup/Direct Call Pickup

Group pages cannot be picked up by other extensions. Another extension cannot pick up a group page. The group page either terminates at the target extension or does not terminate at all. Any other station does not have the opportunity to perform Call Pickup.
- Call Forwarding

The group page cannot be call forwarded. A page call does not follow a page group member's call forward path. No station including the attendant can set the group page to be forwarded to another number. If a page call terminates to a station with call forwarding active, the page does not follow the call forwarding path. The page terminates at the station as in the normal page case.
- Conference

Group members who receive the page and the originator of the page cannot conference the page to other extensions. Group members are prevented from putting the page on hold.
- Distributed Communications System (DCS)

Page groups cannot be administered across DCS switches. DCS is not supported.
- Direct Inward Dialing

Direct Inward Dialing works normally, but can be restricted from originating group pages by changing the COR.
- Go to Cover

The Go to Cover feature is disabled. Page originators cannot send a page call to cover. The page call does not have a coverage path to follow. If the page originator presses the go to cover button, the button press is ignored.

- Hold

Group members cannot put a group page on hold. The originator can put the group page on hold. If a page group member attempts to put the page on hold, the button press is ignored and the page continues normally. The group member pressing the button receives broken flutter on the call appearance lights.
- Leave Word Calling

The Leave Word Calling (LWC) feature is disabled. A page group cannot receive messages. If the LWC calling button is pressed when calling a busy page group, intercept tone is received.
- Manual Signaling

The Manual Signaling feature cannot be assigned to a page group.
- Send All Calls

If a page group member activates Send All Calls (SAC), that member does not receive pages.
- Service Observing

A group page member or originator cannot be service observed while active on a page. If a service observer tries to activate Service Observing on a party involved on an ongoing page, intercept tone is received.
- Tenant Partitioning

Tenant Partitioning is unaffected. The page group extension is forced into tenant partition 1. Regardless of the partition in which the page group members are located, the COR restrictions always apply.
- Transfer

Group members cannot transfer the page. A station can transfer another extension to a group page number. Once a group page originator is active on a page call, they can't transfer the page group to another extension.
- Trunks

Trunks cannot be a page group member. If the user attempts to add a trunk to a page group, they are denied access with the standard error message. Trunks may initiate pages if COR permissions allow for this. Trunk access can be restricted by the COR.

- Vectoring

Paging groups cannot be explicitly added to a vector path. If a user attempts to add a page group to a vector path, they are denied access and receive the error message “Cannot route to a group page group.”

**NOTE:**

If a vector has a collect digits step and a route-to digits step, a person who uses the vector can enter a page group extension. Ensure that the COR of the vector restricts the vector from calling the page group if this action is not desired.

## Hold

---

Hold allows voice-terminal users to disconnect from a call temporarily, use the voice-terminal for other call purposes, and then return to the original call.

### How to administer Hold

---

#### Required Forms

---

| Form                      | Field   | Page                  |
|---------------------------|---|-----------------------|
| Feature Access Code (FAC) | ■ Answer Hold-Unhold                          | <a href="#">5-113</a> |
| Station                   | ■ Button/Feature Button Assignments<br>— hold | <a href="#">6-28</a>  |

---

### Detailed description

---

#### Multiappearance Voice-terminal Hold

Multiappearance voice-terminals have a Hold button for activating Hold.

To hold an active call, press the Hold button. The call is held at the call appearance used for the call. Multiappearance voice-terminal users can hold a call on each call appearance.

#### Single-Line Voice-terminal Hold

Two types of Hold (Soft Hold and Hard Hold) are provided for single-line voice-terminal users.

##### Soft Hold

Soft Hold is used to conference or transfer a call that includes the held call. The user can hold the current call, consult with another party, activate or deactivate a feature, and return to the soft-held call.

- To activate Soft Hold:
  1. Press the Recall button or flash the switchhook while on an active call.
- To conference a call:
  1. Activate Soft Hold.
  2. Dial another party.
  3. Press the Recall button or flash the switchhook a second time.

The held call is conferenced with the user and the other party.

- To transfer a call:

1. Complete a conference call.
2. Hang up.

The held call is conferenced with the other party. The system ignores any subsequent presses of the Recall button or flashing of the switchhook.

- To drop the last party added to a conference call:

1. Complete a conference call.
2. Press the Recall button or flash the switchhook.

This function can be performed only by the controller of the conference call.

## Hard Hold

Hard Hold is used to perform operations that do not include the held call. The user can hold the current call, then call another party, answer a waiting call and transfer or conference that call, activate or deactivate features, and so on.

- To activate Hard Hold

1. Press the Recall button or flash the switchhook while on an active call.
2. Dial the Answer Hold-Unhold access code.

The user can then perform any operation that does not involve the held call.

- To return to the hard-held call:

1. Hang up.

The held call rings the voice-terminal and can then be answered.

or

1. Press the Recall button or flash the switchhook.
2. Dial the Answer Hold-Unhold access code.

The active call is held while the hard-held call becomes active.

### NOTE:

When a user has a call waiting and activates Hard Hold on a current call, an incoming call is answered automatically.

## Considerations

---

- Use Hold to temporarily disconnect from one call and handle another call. For example, a user can place one call on hold and either answer another call or make another call to obtain information for the calling party.
- To drop a call dialed by a single-line voice-terminal within the first 10 seconds (after dialing is completed), flash the switchhook.
- A single-line voice-terminal user cannot hold a call involving an attendant. A multiappearance voice-terminal user can hold a call involving an attendant, unless the user attempts to conference or transfer the call.

## Interactions

---

- Automatic Callback  
A single-line voice-terminal user cannot receive an Automatic Callback call while a call is on hold.
- Bridged Call Appearance  
Any user who is active on a bridged call, can place the call on hold. If no other users with a bridged call appearance of the same extension are connected to the call, the status lamp at the Bridged Appearance button indicates that the call is on hold. If the primary extension or another bridged appearance is connected to the call, the status lamp at all bridged appearances indicates an active status for the call.
- Leave Word Calling (LWC)  
A held multiappearance voice-terminal user can activate LWC toward the holding user.  
A single-line voice-terminal user cannot activate LWC toward another user while a call is on Soft Hold.
- Music-on-Hold  
One party on hold can hear music.
- Personal Central-Office Line (PCOL)  
When a user who is active on a PCOL call puts the call on Hold, the lamp flutters or winks. The status lamp associated with the PCOL button lamp does not track the busy/idle status of the PCOL.
- Priority Calling  
It is possible to receive priority ringing and have a call on soft hold.

## Hold — Automatic

---

Automatic Hold allows attendants and multifunction voice-terminal users to alternate between multiple calls.

### How to administer Automatic Hold

---

#### Required forms

---

| Form                              | Field       | Page                  |
|-----------------------------------|-------------|-----------------------|
| Feature-Related System Parameters | ■ Auto Hold | <a href="#">5-123</a> |

### Detailed description

---

To put an active call on hold (without pressing the HOLD button), press a second call-appearance button. The second call appearance becomes active.

Automatic Hold is the equivalent of pressing the HOLD button. A call placed in Automatic Hold is in Hard Hold.

If Automatic Hold is disabled (the default), the active call appearance drops when a second call-appearance button is pushed. Default (n) in the `Auto Hold` field enables Automatic Drop.

Automatic Hold is enabled and disabled on a system-wide basis. The user of a multibutton voice-terminal may place on Automatic Hold as many calls as the number of call-appearances minus one.

The controlling station can have only one soft auto-held call at a time. A soft hold is the state of a line after the conference or transfer button has been pressed but before either process is completed. The controlling station is guaranteed the ability to reenter any auto-held call later unless the auto-held party or parties disconnect or the auto-held tone times out.

### Considerations

---

- Automatic Hold prevents dropping of active calls.
- When Automatic Hold is enabled and there is a call on active-call appearance, if the user selects an inactive call-appearance the active call is put on hard hold. This is the same as when the multifunction voice-terminal user presses the HOLD button and selects a call appearance. When Automatic Hold is disabled and there is an active call, if the user selects an inactive call appearance, the active call is dropped.
- When only Automatic Hold is involved and the attendant on an active loop presses a second loop, the active call is placed in Hard-Hold.

## 4 Basic Features

### Hold — Automatic

Page 4-362

- Held Call Timed Reminder does not apply to conference calls and is not initiated when a conference is placed on hold.
- Automatic Hold operates in conjunction with the START key or Automatic Start feature of an attendant console. The START key and the Automatic Start operation have precedence over Automatic Hold and place active loop call on Soft Hold.

## Interactions

---

- Centralized Attendant Service  
Automatic Hold operates transparently with CAS.
- Distributed Communications System  
Automatic Hold operates transparently with DCS and is administered separately for each node in a DCS network.
- Hold  
Automatic Hold operates identically to the Hold feature and its interactions. See [“Hold” on page 4-358](#) for details.

## Hot Line Service

---

Hot Line Service allows single-line voice terminal users, by simply lifting the handset, to automatically place a call to a preassigned destination (extension, public or private network telephone number, or feature access code).

### How to administer Hot Line Service

---

#### Required forms

### Detailed description

---

The Hot Line Service destination number is stored in an Abbreviated Dialing List. When the Hot Line Service user lifts the handset, the system automatically routes the call to the stored number and the call completes as if it had been manually dialed. If the appropriate feature access code is prefixed to the stored number,

AAR, ARS, Data Privacy, or Priority Calling can be used on the call. If the Public or Private Network Access code is the stored number, the voice-terminal user is connected to an outgoing trunk and can dial the outside number.

Call reception is not affected by Hot Line Service. A Hot Line Service voice terminal receives calls allowed by its Class of Restriction (COR). The Hot Line Service destination is not affected by Hot Line Service.

A Direct Department Calling (DDC), a Uniform Call Distribution (UCD), a Terminating Extension Group (TEG) extension, or any individual extension within a group can be a Hot Line Service destination. Also, any extension within a DDC group, UDC group, or TEG can have Hot Line Service assigned.

## Considerations

---

- Use Hot Line Service when very fast service is required and when you use a voice terminal only for accessing a certain facility.
- Any number of voice terminals can be assigned Hot Line Service with the same or different destinations. The limitation is the number of entries that can be stored in the Abbreviated Dialing lists.
- A Hot Line Service user cannot activate any feature unless the access code is the destination number or is part of the destination number.

## Interactions

---

- Bridged Call Appearance — Single-Line Voice Terminal  
If a single-line voice terminal is administered for Hot Line Service, a bridged appearance extension also places a hot line call automatically when a user goes off-hook on that bridged appearance.
- Loudspeaker Paging Access  
Loudspeaker Paging Access can be used with Hot Line Service to provide automatic access to paging equipment.
- Ringback Queuing  
If a Hot Line Service call accesses a trunk group with Ringback Queuing, the call can queue unless the voice terminal is Termination Restricted by its COR. Queuing, when applicable, is automatic on single-line voice terminals. Dialing is not required.

## Hunt Groups

---

A hunt group is a group of extensions that can handle multiple calls simultaneously to a single phone number. For each call to the phone number, the system hunts for an available extension in the group and connects the call to that extension.

A hunt group is especially useful when you expect a high number of calls to a particular phone number. A hunt group might consist of people trained to handle calls on specific topics. For example, the group might be:

- A benefits department within your company
- A service department for products you sell
- A travel reservations service
- A pool of attendants

In addition, a hunt group might consist of a group of shared telecommunications facilities. For example, the group might be:

- A modem pool
- A group of data-line circuit ports
- A group of data modules

**NOTE:**

You may also assign Automatic Call Distribution (ACD) to a hunt group. In this case, the hunt group is known as an ACD split. See [“Automatic Call Distribution” on page 9-25](#) for more details about ACD splits.

### How to administer Hunt Groups

---

**Required forms**

| Form                            | Field                                | Page                  |

## Detailed description

---

The following sections describe how a hunt group works.

### Hunting methods

The system uses one of two types of hunting method to distribute calls:

|                           |   |
|---------------------------|---|
| Direct department calling | The system hunts for an available extension in the hunt group, always starting with the first extension in the group. If the first extension is busy, the system checks the second extension. If the second extension is busy, the system checks the third, and so on. When an extension is available, the system rings that extension to connect the call. |
| Uniform call distribution | The system hunts for the extension that has been available for the longest time. The system then rings that extension to connect the call. This type of hunting provides the most equitable distribution of calls. <i>Also, this type of hunting is required for a modem pool, data-line circuit ports, and data modules.</i>                               |

#### NOTE:

With Expert Agent Selection, the hunting method is different. See [“Expert Agent Selection” on page 9-72](#).

### Hunt group queues

You can set up a queue for a hunt group. When all extensions in the group are busy, calls wait in queue for the next available extension. You determine how many calls can wait in queue by setting the queue length.

If all hunt-group members are unavailable or the queue is full, the system treats the call as follows:

- If the call is internal or is carried on a DID, DS1, or tie trunk, the caller hears busy tone.
- If the call is on a central office trunk, the caller hears ringing, but gets no answer.
- If the hunt group has call coverage, the system sends the call to a coverage point.

See [“How hunt group extensions become unavailable” on page 4-368](#).

## Queue warning level

You can set up a queue warning level and an associated queue warning indicator lamp. When the queue reaches this level, the lamp lights and remains lit until the queue drops below this level. You can have one lamp for each hunt-group queue. Install the lamp the hunt group can see it.

## Call coverage

You can set up call coverage for a hunt group. Then, if a hunt-group queue is full, the system sends new calls to the coverage point.

If a call goes into a hunt group queue, it stays in queue for the Coverage Don't Answer interval, then redirects to the coverage point. A call coverage point can be another hunt group.

## Announcements

You can record and assign one delay announcement to each hunt-group queue. An announcement can be shared among hunt groups. Normally, the announcement should tell the caller to wait and say that the call will be answered in the order in which it was received.

A call that connects to a delay announcement remains in queue while the announcement plays. If the call has not been answered by the time the announcement completes, the caller hears music (if provided) or silence. When the call begins ringing a member of the hunt group, the caller hears ringing.

**Delay announcement interval.** You also define for each hunt group a delay announcement interval. When a call enters the queue, the interval starts. This interval (0 to 99 seconds) indicates how long a call remains in queue before the call connects to a recorded announcement. If Call Coverage is provided, the Don't Answer interval (one to 99 ringing cycles) may also begin when the call enters the queue. After these intervals begin, one of the following occurs:

- If the Don't Answer interval expires before the delay announcement interval expires, the call redirects to coverage.
- If no coverage point is available to handle the call, the call remains in queue and may connect to the delay announcement.
- If the delay announcement interval expires before the Don't Answer interval, the call connects to a delay announcement. If the announcement is already in use, the delay announcement interval is reset.

This process continues until the call is answered, goes to coverage, connects to an announcement, or ends because the caller hangs up.

If you set the delay announcement interval to 0 seconds, a call automatically connects to the announcement. The result is a "forced first announcement." In this case, the call does not connect to a hunt-group member until after the announcement. The caller does not hear music.

If a call redirects to another hunt group via Call Coverage, the caller does not hear either hunt group's forced first announcement. However, the caller may hear the first or second announcement of the covering hunt group.

**Analog, aux-trunk, or integrated announcements.** Delay announcements may be analog, aux-trunk, or integrated (digital). For an analog or aux-trunk announcement, callers who enter the queue hear the associated announcement the next time the system plays it. Callers who enter the queue after the announcement begins do not hear it until it starts again. For an integrated announcement, multiple callers can be connected to the same announcement at different times, depending on the availability of ports. See ["Recorded Announcement" on page 4-500](#) for more information.

### Example

Assume that a hunt group has the following parameters.

- Queue length is 10 calls.
- Queue warning level is 5 calls.
- Recorded announcement delay is 20 seconds.

All hunt-group members are busy. A call enters the queue as the fifth call, which causes the queue warning level lamp to light. Hunt-group members see the lamp and try to quickly complete their present calls. Meanwhile, the call waits in the queue for 20 seconds and hears the recorded announcement. When a hunt-group member becomes available, the first call in queue connects to that group member. The queue warning-level lamp turns off because the number of calls in queue fell to four.

## How hunt group extensions become unavailable

An extension in a hunt group becomes unavailable to receive calls if the hunt group member is already handling a call. This rule is true even if the call is not a hunt-group call and even if the extension's voice terminal is a multiappearance terminal.

An extension also becomes unavailable if the member presses one of the following buttons:

- Hunt Group Busy
- Send All Calls
- Call Forwarding All Calls

### NOTE:

If a member is also an ACD agent, pressing the AUX work button also makes the member unavailable. On the other hand, if an agent presses the ACW (after call work) button, the system considers the agent be available and will still queue calls.

## Hunt Group Busy

If you turn on the Hunt Group Busy option, a hunt group member can dial the Hunt Group Busy code followed by the hunt group number. The extension is unavailable for calls until the group member dials the Hunt Group Busy cancellation code or presses the button again.

If the last available member of a hunt group tries to activate the Hunt Group Busy option, the following occurs:

- New calls to the hunt group receive busy tone or go to coverage.
- Calls already in the queue continue to route to the last available extension.
- When the queue is empty, Hunt Group Busy is activated. At the last available extension, the status lamp associated with the Auxiliary Work button, if provided, flashes until the queue is empty. When no more calls remain in the queue, Hunt Group Busy is activated and the status lamp, if provided, lights steadily.

### NOTE:

If an extension is an ACD split agent as well as a hunt-group member, the split agent normally has an AUX-work button that also activates/deactivates Hunt Group Busy. If an agent is the last available member and he/she pushes AUX-work, the button's light flashes until the queue is empty. This means that the agent is still available. When the queue finally empties, the button lights steadily and Hunt Group Busy takes effect.

## Send All Calls

Normally, if a hunt-group member presses the Send All Calls button, the system still sends calls to that member, but the calls go to coverage. Therefore, members should not normally use Send All Calls to become unavailable.

### NOTE:

If an extension is an ACD split agent as well as a hunt-group member, the split agent normally has an AUX-work button that also activates/deactivates Hunt Group Busy. If an agent presses the Send All Calls button, the agent becomes unavailable for hunt-group calls. The agent can then become available for calls again by pressing the Send All Calls button again.

## Call Forwarding All Calls

With Call Forwarding All Calls active, an extension within a hunt group is unavailable for hunt-group calls. Callers hear the hunt group's forced first announcement, if administered, before the system forwards the call.

## Considerations

---

- Members assigned to multiple hunt groups

An extension can be a member of more than one hunt-group. However, a voice terminal, even a multiappearance terminal, can receive only one hunt group call at a time. On a multiappearance terminal, all appearances must be idle to receive a hunt-group call.

You can assign a Coverage Incoming Call Indicator (ICI) button to a multiappearance voice terminal or attendant console. When a member receives a call for the hunt group associated with the ICI button, the button's status lamp lights.
- ACD agents as hunt group members

Do not include ACD split agents in non-ACD hunt groups if they also receive ACD split calls. The system distributes all ACD calls to split agents before it distributes hunt-group calls.

When you change an ACD split to a non-ACD hunt group, each split agent must enter the Hunt Group Busy deactivation code in order to receive calls in that hunt group. If the agent has an AUX-work button, the button lamp lights when you make the change. The agent can then press the button to become available for hunt-group calls.
- Hunt group for communications devices

Members of a hunt group used for shared data communications must be of the same type. Thus, you can put data modules or analog modems in a hunt group, but not both. Option settings must be the same for all group members.

A caller can still use the Data Extension button to access the associated data module, even if the module is in a hunt group. Individual data modules or modems can originate and receive calls.
- Access restrictions

You can restrict, via the Class of Restrictions, any extension in a hunt group from receiving calls other than those to its assigned hunt group. You can also restrict extensions on your switch from calling the hunt group's extension.
- System limits

The size of your system determines how many hunt groups you can set up and how many extensions you can assign to each group.
- Trunk signaling

A hunt group always has its own extension. Therefore, a caller with a phone on the switch can call the hunt group by dialing only that extension. If a trunk group has the ability to pass digits from the CO to the switch (for

example, a DS1 trunk group with immediate signaling), a caller can also call the hunt group by dialing a 7-digit phone number that consists of a specified prefix and the hunt group's extension.

If a trunk group cannot pass digits from the CO to the switch, incoming calls on that trunk group can connect to a hunt group only if the trunk group has the hunt-group extension as its primary destination. This includes trunk groups for incoming LDN calls, international exchange calls, 800 service calls, and automatic tie-trunk calls. The hunt group's phone number can be completely different from the hunt group's extension.

- Answer supervision

The switch sends answer supervision to the central office when a call connects to an extension in the hunt group or an announcement. Charging for the call, if applicable, then begins.

## Interactions

- Attendant Call Waiting

Attendant Call Waiting does not work for calls that the attendant sends to a hunt group. It does work for calls to individual hunt-group members.

- Attendant Return Call

Attendant Return Call does not work for calls that the attendant sends to a hunt group.

- Automatic Callback

Automatic Callback does not work on calls to a hunt group.

- Call Detail Recording

For each call, the system can record the associated hunt-group extension or member extension that answered.

- Internal Automatic Answer

Internal calls to a hunt-group member are eligible for IAA.

- Leave Word Calling

A hunt group can receive and store LWC messages. The following people can retrieve LWC messages:

- One member of the hunt group
- A covering user of the group
- A system-wide message retriever

The message retriever must have a voice-terminal display and proper authorization. If the message retriever is a member of the hunt group, you can assign to that member a remote Automatic Message Waiting lamp to indicate when the hunt group has an LWC message.

- Night Service — Hunt Group

When Night Service is active for a hunt group and the night service destination is another hunt group, the caller hears the forced announcement of the first hunt group, if administered. The system then redirects the call to the night-service hunt group.

- Priority Calling

The system treats a priority call to a hunt group the same as a nonpriority call, except that the extension receives a distinctive 3-burst ring.

- Terminating Extension Group

A Terminating Extension Group cannot be a member of a hunt group.

## Incoming Call Line Identification on Analog Trunks

Incoming Call Line Identification (ICLID) provides you with the calling party name and number received from the central office (CO). This occurs on a CO loop-start trunk in the U.S. and on a CO loop-start, DID, or DIOD trunk in Japan.

### How to administer ICLID

#### Required forms

| Form                                  | Field                             | Page                  |
|---------------------------------------|-----------------------------------|-----------------------|
| System-Parameters<br>Customer-Options | ■ G3 Version                      | <a href="#">5-277</a> |
|                                       | ■ Analog Trunk Incoming Call ID   |                       |
| Trunk Group                           | ■ Country                         | <a href="#">7-115</a> |
|                                       | ■ Group Type                      |                       |
|                                       | ■ Answer Supervision Timeout      |                       |
|                                       | ■ Receive Analog Incoming Call ID |                       |
| Administrable Timer                   | ■ Incoming Seizure (msec)         | <a href="#">7-115</a> |

On System-Parameters Customer-Options form, set

- G3 Version field to **V6** or greater.
- Analog Trunk Incoming Call ID field to **y**.

On Trunk Group form, set

- Group Type field to **co**, **did**, or **diod**.
- Receive Analog Incoming Call ID field to **Bellcore** (for U.S.) or **NTT** (for Japan).
- Direction field is **incoming** or **two-way**.

On Administrable Timer form, set

- Incoming Seizure (msec) to **120**.

To turn off ICLID, set

- Receive Analog Incoming Call ID field on System-Parameters Customer-Options form to **disable**.
- Analog Trunk Incoming Call ID on Trunk Group form to **n**.

## 4 Basic Features

### Incoming Call Line Identification on Analog Trunks

Page 4-374

## Hardware requirement

TN429D CO Trunk circuit pack or later configuration

## Detailed description

In the US, the CO sends both calling party name and number, if they are available; in Japan, the CO sends only the calling party number.

Display of calling party information works with all DEFINITY ECS digital voice terminals (DCP and BRI) equipped with a 40-character or 32-character alphanumeric display. The analog voice terminals supported are the 7315H and 7317H series (System 25/MERLIN sets supported by DEFINITY).

For the ICLID on analog trunks, DEFINITY ECS stores and displays 15 characters of name and number information. If a name/number is longer than 15 characters, the name/number truncates to 15 characters.

In the absence of caller ID information, or in the case of a CO transmission error, the trunk group name and trunk access code display.

## Interactions

### ■ Attendant Display Features

A redirected call to either the attendant or attendant queue causes the display on the attendant's station to read similar to that of the connected party station display.

### ■ Automatic Display of Incoming Call Identification

If a new call comes in while the station user is off-hook and connected to a call, the display automatically shows the new incoming call identity for 30 seconds. After 30 seconds, the display returns to the selected call. If the call redirects after a few rings, the display returns to the selected call. If an incoming call drops and that call currently displays, the display returns to the selected call.

### ■ Bridged Call

Incoming call identity displays on both the primary station and the bridged station.

### ■ Call Forwarding

Forwarded-From Station Display — no information displays on the called principal's station.

Forwarded-To Station Display — shows the identity of the calling and called party and the reason (R) code. If the forwarded-to station is on a different switch, the called party information does not forward.

## 4 Basic Features

### *Incoming Call Line Identification on Analog Trunks*

Page 4-375

#### ■ Call Pickup

Called Party Station Display — shows the calling party's identity.

Answering Party Station Display — If Call Pick-Up answers an ICLID call, the display shows both the calling party and the called principal's identities.

#### ■ Call Coverage

Called Principal's Display — The called principal's display shows the calling party's identity until the coverage party answers the call. If the coverage party answers the call, the principal's station display becomes blank. If the called principal temporarily bridges in after the coverage party answers the call, then the coverage party and the called principal's displays change to indicate a conference call.

Coverage User Station Display — The coverage user's station display shows the same display as the connected party station display.

#### ■ Call Vector Routing

When an ICLID call coming from analog trunks transfers to a Vector Directory Number (VDN), the incoming calling number is directed to VDN so call vector routing can be based on the ICLID information.

The ANI received for the incoming call (via inband or ISDN) forwards with a route-to step over a trunk that supports ANI delivery (inband or ISDN).

#### ■ DCS Feature Interaction

If the DEFINITY ECS has both DCS and ISDN display features, the ICLID information displays in DCS formats.

#### ■ Hold

When activated, the display becomes blank. The party activating the Hold reads the newly connected party's identity. The held station's display remains unchanged. When the party unholds, the display refreshes to indicate the call's current state.

#### ■ Malicious Call Trace

When activated for a particular call, MCT displays incoming calling numbers to controller stations.

#### ■ Tandem Operations

The calling party name/number passes to the terminating switch over ISDN trunks with DCS+.

#### ■ Transfer

When an ICLID call transfers, the display of the transferred-from station becomes blank. The transferred-to station displays the identity of the transferred-from party if the transfer is not yet completed. Once the transfer completes, the transferred-to station displays the identity of the calling party.

## Individual Attendant Access

---

Individual Attendant Access allows you to access a specific attendant console and assign each attendant console an individual extension.

### How to administer Individual Attendant Access

---

#### Required forms

---

| Form               | Field                                   | Page                 |
|--------------------|---|----------------------|
| Dial Plan Record   | ■ First Digit Table                     | <a href="#">5-99</a> |
| Attendant Console  | ■ Extension<br>■ Name<br>■ COR<br>■ COS | <a href="#">5-35</a> |
| Console Parameters | ■ All                                   | <a href="#">5-86</a> |

### Detailed description

---

A user can access an individual attendant by dialing the extension assigned to the attendant. You can also assign an individual attendant extension to a users' abbreviated-dialing button for fast access to the attendant.

An individual attendant, when called, can extend the call to another trunk or extension.

Each attendant has a queue for incoming calls.

Whenever a call is in an attendant's queue, the top lamp of the Forced Release button (basic console) or the Personal lamp (enhanced console) light. Console Call Waiting tones are provided only on calls to the attendant group, not on calls to individual attendants.

An attendant can be a part of a hunt group. The hunt group can be a DDC group or a UCD group. Calls to individual attendants and calls to the attendant group have priority over hunt-group calls to individual attendants.

Any call made from an attendant console that is assigned an individual extension is considered to be made from the individual attendant, not the attendant group.

## Considerations

---

- Individual attendant extensions allow attendants to use features that an attendant group cannot use — for example, extensions can be members of a DDC or UCD group. An individual attendant extension can have its own Class of Restriction and Class of Service.
- The Position Available lamp on the attendant console indicates whether or not attendant-group calls can be accepted. The lamp does not indicate whether or not individual attendant calls can be accepted.
- Each attendant console has one position-busy button. When the button lamp lights, the attendant does not receive attendant group calls but can still receive individual attendant calls.
- Because hunt groups offer queuing and make-busy features, you may wish to assign an individual attendant as the only member of a hunt group.

## Interactions

---

- Abbreviated Dialing  
Individual attendant extensions can be in Abbreviated Dialing lists. Individual attendants, however, cannot have their own Abbreviated Dialing lists.
- Attendant Display  
For calls to or from individual attendants, attendant names (when specified) display instead of their extensions.
- Attendant Priority Queue  
Calls queue according to the priority assigned in Attendant Priority Queuing.
- Bridged Call Appearance  
Do not assign individual attendant extensions to a bridged call appearance.
- Busy Verification of Terminals and Trunks  
An individual attendant extension cannot be busy-verified.
- Call Coverage  
Individual attendant extensions can be points in a coverage path but cannot be members of a coverage answer group.
- Call Park  
Individual attendants can park calls on their own extensions or other individual attendant extensions.
- Call Pickup  
Individual attendant extensions cannot be in Call Pickup groups.

## 4 Basic Features

### *Individual Attendant Access*

Page 4-378

- **Centralized Attendant Service**

Access individual attendants when CAS is in effect.
- **COR and COS**

Each individual attendant extension has its own COR and COS. Assign an individual attendant and the group with which the attendant is associated to the same COR.
- **Hunt Groups**

Assign individual attendant extensions to DDC and UCD groups. Unlike voice-terminal users, individual attendants can answer DDC and UCD calls as long as there is an idle call appearance and no other DDC or UCD call is on the console.
- **Facility Busy Indication**

Store an individual attendant extension in a Facility Busy Indication button.
- **Integrated Directory**

Store the names and extensions of individual attendants in the Integrated Directory.
- **Leave Word Calling**

A message from an attendant indicates whether it is from the attendant group or an attendant with an individual extension.
- **Night Service — Night Console Service**

This feature affects only calls to the attendant group. Allow calls to individual attendant extensions when night service is active. A night-only attendant console with an individual extension can receive individual attendant calls when night service is active.
- **Privacy — Attendant Lockout**

This feature applies only to attendant-group calls. It does not affect individual attendant calls.
- **Voice Terminal Display**

For calls from individual attendants, attendant names (when specified) display instead of their extensions.

## Integrated Directory

---

Integrated Directory allows users with display-equipped terminals to access the system directory, use the touch-tone buttons to key in a name, and retrieve an extension from the directory. The directory contains the names and extensions assigned to all voice terminals administered in the system.

The use of Vector Directory Number names and extensions is not supported for this feature.

### How to administer [Integrated Directory](#)

---

#### Required forms

---

### Detailed description

---

Administer the names in the directory on the Individual Voice Terminal forms. Names cannot exceed 27 characters (including spaces and commas). Enter names in one of the following formats:

- Last name, comma, first name, space, middle name or initial (if desired).  
 For example:
  - Jones, Betty Ann
  - Smith, A E
  - Thomas, John J
  - Abbott, Lynn

## 4 Basic Features

### Integrated Directory

Page 4-380

- First name, space, second name or initial, space, and last name. For example:
  - Betty Ann Jones
  - A E Smith
  - John J Thomas
  - Lynn Abbott
- A single entry is also acceptable. For example:
  - Cafeteria
  - 1J409
  - 2F816
  - Purchasing

Characters allowed in the directory database are the alphanumeric characters (A–Z, a–z) and digits (0–9) as well as space ( ) and comma (,) for delimiters. In addition, the following special characters are allowed: hyphen (-), apostrophe ('), period (.), slash (/), and ampersand (&).

Use touch-tone buttons to key in the numbers and letters labeled on them. The following exceptions apply:

- **7** (PRS) is also used for a Q.
- **9** (WXY) is also used for a Z.
- **\*** is used for a space or comma.
- **#** is not used.

To activate the directory, the user presses the Integrated Directory button. This puts the voice terminal in Integrated Directory mode and turns off the tones that are normally generated when touch-tone buttons are pressed. The touch-tone buttons now are used exclusively for keying in names and not for dialing.

After the Integrated Directory button is pressed, the alphanumeric display shows `DIRECTORY – PLEASE ENTER NAME`. Names are always keyed in the following order: last name, comma, first name or initial. If a character outside the allowed set is entered as the name of a station or data module, the directory search for that name fails.

When a button is pressed, the display shows the first name that matches the first letter on the button. The user can continue to enter letters to narrow the search. When the desired name and extension are displayed, the user can automatically place a call to that person by pressing the Call Display button.

If the user enters a name that cannot be found in the directory, the display shows `NO MATCH – TRY AGAIN`.

To exit Integrated Directory mode, the user presses another mode button, such as the Normal mode button.

## Considerations

---

- Integrated Directory saves users time looking up names and extensions. Instead of searching through lists or directories, a user simply keys in the desired name and the display shows the name and extension.
- If more than the maximum number of users try to activate the feature at the same time, the Integrated Directory button lights and the display shows *Directory unavailable — Try Later*.
- The entire directory cannot be searched by pressing just one key, such as 2. Pressing 2 and then continually pressing Next Message displays, one by one, all entries beginning with A, B, C, and 2. If all entries have been displayed and Next Message is pressed again, the display repeats from the first entry in the listing associated with 2.
- When the voice terminal is in Integrated Directory mode, it cannot be used to make calls or access features by dial code. It can, however, still be used to activate other features or to place calls for which dialing is not required. Also, a user can enter Integrated Directory mode while active on a call, and can receive calls while Integrated Directory mode is active.

## Interactions

---

- Attendant Display and Voice Terminal Display  
If prefixed extensions are used in the system's dial plan, the prefix is not displayed when the extension is displayed. The Call Display button can be used to dial prefixed extensions because the system dials the prefix, even though it is not displayed.
- Distributed Communications Systems  
This is not a DCS feature. Integrated Directory does not work between DCS nodes.
- Merlin<sup>®</sup>/System 25 Voice Terminal Support — 731xH Series Support  
The Merlin/System 25 7309H, 7313H, 7314H, 7315H, 7316H, and 7317H voice terminals do not support Integrated Directory displays.
- Touch-Tone Dialing  
Call origination and feature access by dial code are not allowed when Integrated Directory is active.

## **Integrated Services Digital Network — Basic Rate Interface Endpoints**

---

The Integrated Services Digital Network (ISDN) eliminates the need for multiple, separate access arrangements for voice, data, facsimile, and video services and networks. Using the same pair of wires that now carry simple telephone calls, ISDN delivers voice, data, and video services in a digital format.

ISDN is a global access standard established by the Consultative Committee for International Telephone and Telegraph (CCITT). ISDN uses a layered protocol that conforms to layers one (physical), two (link), and three (network) of the 7-layer Open Systems Interconnect (OSI) Reference Model of the International Standards Organization (ISO).

DEFINITY ECS supports the two major interfaces specified in the ISDN standards: Primary Rate Interface (PRI) and Basic Rate Interface (BRI).

- ISDN-PRI connects premises equipment such as switches to the network, and acts as a powerful interface between intelligent equipment such as switches and computers.
- ISDN-BRI connects telephones, personal computers, and other desktop devices to higher-order equipment, such as a switch. It can also connect ISDN-BRI trunks. (See [“ISDN-BRI trunk group” on page 7-198.](#))

Both PRI and BRI are based on the same common building blocks — the use of a common interface to a transmission path that is divided into channels. Both PRI and BRI use 2 types of channels for communication:

- Bearer channels (B-channels) are the communications links in ISDN. They provide 64-Kpbs digital communications service for voice, data, video, and other information transmission.
- Data channels (D-channels) are the signaling links in ISDN. They carry call-control and call-related information, such as caller ID, between ISDN endpoints. An endpoint may be a BRI voice terminal, BRI data module, or integrated BRI voice and data terminal.

ISDN-BRI is a 192-Kpbs interface that carries two 64-Kpbs B-channels and one 16-Kpbs D-channel. Although ISDN-BRI supports data transmission on the D-channel, DEFINITY ECS does not support this capability, and provides only signaling on this channel. ISDN-BRI provides much of the same functionality provided with the Digital Communications Protocol (DCP).

## How to administer ISDN-BRI

---

### Required forms

---

| Form                  | Field | Page                  |
|-----------------------|-------|-----------------------|
| Station (7500 series) | ■ All | <a href="#">6-130</a> |
| Station (8500 series) | ■ All | <a href="#">6-130</a> |
| 7500 Data Module      | ■ All | <a href="#">6-252</a> |

## Detailed description

---

DEFINITY ECS supports the following transmissions across ISDN-BRI to an endpoint:

- A single voice call
- A single data call
- A voice call and a data call simultaneously
- Two simultaneous data calls

ISDN-BRI offers two possible configurations: multipoint and point-to-point.

### Multipoint configuration

In this configuration, the system supports two ISDN-BRI endpoints per port. Endpoints can be:

- Both voice-only
- Both data-only
- One voice-only and one data-only

Both endpoints on a port connect to the switch by the same wire. One endpoint uses the B1-channel and the other uses the B2-channel. Each endpoint has its own ISDN-BRI and its own extension. The system distinguishes between the 2 endpoints by means of each endpoint's unique Service Order Profile Identifier (SPID).

If two endpoints can each support only one call, then you can administer both endpoints on the same BRI port so as to provide a multipoint configuration. In this case, 2 calls potentially can use the two B-channels simultaneously.

## Point-to-point configurations

In this configuration, the system supports one ISDN-BRI endpoint per port. The endpoint can be:

- Voice-only
- Data-only
- Integrated voice and data

When one endpoint can support two simultaneous B-channel calls, you must configure the endpoint as point-to-point. This is because the two services potentially can use both B-channels simultaneously.

Even though an integrated voice and data endpoint supports both voice and data calls, the integrated endpoint does not use a multipoint configuration because it uses only one endpoint.

## Service Profile Identifier

When more than one endpoint is connected to a BRI port (for example, a multipoint configuration), the switch uses the SPID to associate endpoints with the administered station or data-module extensions. The SPID enables the switch to differentiate between the endpoints connected to the same BRI port.

You first must administer the SPID on the Station or Data Module forms. Then you can program the SPID in the BRI endpoint using the procedure in the endpoint's user manual. During initialization, the endpoint sends the SPID to the switch. The SPID you administered on the Station or Data Module forms must match the SPID programmed into the endpoint. Otherwise, the system restricts service to that endpoint.

A multipoint configuration requires SPID administration and programming. However, SPID administration is optional in a point-to-point configuration because only one endpoint is connected to the BRI port. If you administer the SPID in a point-to-point configuration, the SPID must match the SPID programmed into the endpoint. If you do not administer the SPID, the switch uses the port to associate the endpoint to the administered station or data module extension.

## Terminal Equipment Identifier

The terminal equipment identifier (TEI) initiates communication between the switch and an endpoint. DEFINITY ECS supports two types of TEIs: fixed and automatic.

A fixed TEI endpoint supports one fixed TEI value (0 to 63), which is encoded into the terminal equipment and the fixed TEI initialization procedure. When you administer a fixed TEI endpoint, you must assign the endpoint's fixed TEI value to the Station form or Data Module form for that endpoint. If the endpoint's fixed TEI

## 4 Basic Features

value differs from the TEI that is assigned to the Station form or Data Module form for that endpoint, communication is not established between the switch and the endpoint. As a result, the endpoint is incapable of providing services. Normally, the manufacturer specifies the fixed TEI value that is encoded into the terminal or provides procedures for modifying the fixed TEI value.

An automatic TEI endpoint supports automatic TEI initialization procedures. It receives a TEI from the system during initialization. With automatic TEI endpoints, you do not enter any TEI values to the Station form or Data Module form. In multipoint configurations, you can use only the automatic TEI endpoints. Currently, all supported BRI endpoints are automatic TEI endpoints.

### **ISDN-BRI voice/data terminal equipment**

Voice transmission on ISDN-BRI is provided by the 7505, 7506, 7507, 8503T, 8510, and 8520 voice terminals. All tests and services available to DCP (Digital Communications Protocol) users are also available to BRI users.

Data transmission on ISDN-BRI is provided by the 7500 Data Module (or a compatible stand-alone data module) and the Asynchronous Data Module (ADM). The 7500 Data Module is a stand-alone unit that supports asynchronous or synchronous Data Communications Equipment (DCE) and asynchronous Data Terminal Equipment (DTE):

- In asynchronous mode, the 7500 supports packet-switched or circuit-switched data communications. You control the 7500 via the front panel or the keyboard of a connected terminal.
- In synchronous mode, the 7500 supports circuit-switched or nailed-up data communications. In this mode, the 7500 requires either the Multipurpose Enhancement Board or the High-Speed Synchronous Enhancement Board. You control the 7500 via the front panel only.

The Asynchronous Data Module (ADM) may be used with asynchronous DTE as a data stand for 7500-series ISDN-BRI voice terminals. The ADM consists of a board located inside the ISDN-BRI voice terminal. It allows the transmission of integrated voice and data through one voice terminal. (Separate extensions are used for the voice and data calls.) The ADM supports the Hayes command set for compatibility with PC communications packages.

The PC/ISDN Platform provides both voice and data transmission and is part of the AT&T PC Interface package, Group 3. You can use the PC/ISDN Platform in a stand-alone (no associated voice terminal) configuration. When used in a stand-alone configuration or with a handset or headset, rather than with one of the 7500 series voice terminals, PC/ISDN Platform does not support Management Information Messages (MIMs). Therefore, these stations do not perform an initialization procedure with the switch. They also do not require a SPID and do not initiate or respond to MIMs. Even when the platform is used with

a 7500 series voice terminal, you should still administer the endpoint (combined PC and phone) as a noninitializing terminal that does not support MIMs.

**⇒ NOTE:**

When more than one PC/ISDN interface card is used on the same PC, each card provides a separate interface and is translated on the switch with its own Equipment Line Location (ELL) as a separate station.

### Endpoint initialization

To be fully operative, BRI endpoints must successfully complete endpoint initialization. Initialization usually occurs at installation time or as part of reconfiguration.

### Multipoint configurations on BRI ports

Passive-bus multipoint configuration, supports two BRI endpoints per port. When you change from point-to-point to multipoint configuration, you need not reinitialize the original endpoint. However, in a multipoint configuration, you can administer only endpoints that support SPID initialization.

### Exchange of user information

The BRI protocol allows users to exchange up to 128 octets of user information end-to-end. The information is passed in user-to-user information elements (IE) without being interpreted by the switch.

## ISDN-BRI data service

### Basic digit dialing

Regular digit dialing is provided through the ADM. System users enter digits 0 to 9, \*, and #. They can dial from either the set keypad or the EIA (Electronic Industries Association) terminal interface.

### Default Dialing

Default Dialing is an enhancement to Data Call Setup. If you administer Default Dialing and users either type **d** or press the data button twice, the switch terminates the call to the default address. If you do not administer Default Dialing, the call disconnects. Default Dialing and Data Hotline are mutually exclusive.

### Data Hotline

Data Hotline is a security feature that allows a user to enter a `Dial` command, with no address specified. The switch terminates the call to a pre-administered hotline destination. If a user enters an address, either intentionally or unintentionally, the system routes the call as if the user had entered the hotline destination address. This service does not impose any restriction on incoming calls received at the endpoint. Data Hotline and Default Dialing are mutually exclusive.

## Administered Connections

Administered Connection (AC) causes the system to establish an end-to-end connection between two access endpoints or data endpoints automatically when the system is restarted or AC is administered and active. You define the attributes of these connections on the Administered Connection form via the G3-MT.

Once you have administered the ADM as one endpoint of an AC, the system waits for the scheduled time to initiate the connection. At the scheduled time, the system establishes the connection and maintains it for the specified length of time. Once the call is accepted, the set enters into the continuous mode for the specified length of time. If the switch is rebooted during the continuous connection, the connection re-initiates call setup. If the connection drops, the switch re-initiates call setup.

## Call request

DEFINITY ECS handles all currently defined BRI bearer data-call requests. Capabilities that Lucent terminals do not support may be supported by non-Lucent terminals. For those capabilities the switch does not support, a proper cause value is returned to the terminal.

Cause values identify why a call is cleared. The BRI data modules convert certain cause values to text messages for display.

## Considerations

---

- The system supports up to 60 simultaneous voice calls on a BRI. You can administer two 7507 terminals on a BRI port, each of which supports up to 30 call appearances/bridged appearances.
- DEFINITY ECS supports BRI data endpoints that perform layer 2 disconnect. Administer these endpoints as non-MIM-supporting data-only endpoints.
- DEFINITY ECS supports BRI voice and data terminals that perform enbloc sending with any one of the following formats:
  - A SETUP message with all the digits in the Keypad IE and a Sending Complete IE
  - A SETUP message with all the digits in the Called Party Number IE and a Sending Complete IE
  - A SETUP message with all the digits in the Called Party Number IE and no Sending Complete IE
- The following features are *not* provided to BRI users:
  - Because the ISDN-BRI protocol requires that the bearer capability must be specified when sending the SETUP message and cannot be changed during the call, some functions cannot be provided to

## 4 Basic Features

### *Integrated Services Digital Network — Basic Rate Interface Endpoints*

Page 4-388

BRI voice users. The following functions require a change in the bearer capability after a call is established and so are not available to BRI voice users:

- One-button voice-call setup transfer to data
  - One-button data-call setup transfer to voice
  - Pre-indication of a data call
  - Voice-call transfer to data and data-call transfer to voice
- Features using the switchhook and Recall button (for example, Call Waiting and Analog Conference/Transfer/Hold/Drop) are available on analog voice terminals only.
- If users with 7506D or 7507D terminals make calls that require additional digits, the terminal inserts a comma in the displayed dial sequence to separate the called number from subsequent information.
  - Separate extensions numbers are used for voice and data calls to the same endpoint.
  - Two simultaneous data calls to a single endpoint use the same extension number.

## Interactions

- **Busy Tone Forward Disconnect**

BRI terminals require that Busy Tone Forward Disconnect (BTFD) be turned off. With BTFD off, an agent with Malicious Call Trace is able to change states after a call.
- **Data button**

Besides the call appearance and feature buttons, BRI voice/data terminals have a fixed, dedicated data button (button 7 on the 7505D and 7506D voice terminals, and button 31 on the 7507D voice terminal) that is used for data-call setup. In general, feature buttons such as Call Forwarding or Send All Calls buttons are always associated with voice features, and cannot be used in conjunction with the data button. For example, the user cannot activate Call Forwarding for the associated data endpoint by using the data button followed by the Call Forwarding button and the designated extension.
- **Interworking**

The same off-premises call types are permitted as for DCP, with the exception of voice-to-data and data-to-voice transfer.
- **Modem Pooling**

Modem Pooling provides the necessary protocol conversion between Mode 2 digital data endpoints and analog data facilities. A modem pool resource needs to be inserted during call setup for both call origination

## 4 Basic Features

### *Integrated Services Digital Network — Basic Rate Interface Endpoints*

Page 4-389

and call answering. This resource translates data between Digital Multiplexed Interface (DMI) Mode 2 protocol used by BRI data endpoints and the modulated signal used by the modem.

- Preselection

When the user of an ISDN-BRI station assigned with the `Select Last Used Appearance` field set to `y` completes a transfer while off-hook using the handset, the user hears a dial tone on the last-used appearance, rather than silence.

- Voice Terminal Display

BRI terminals control their displays. For example, when a user dials state (BRI terminal is in the `Overlap Sending` state), any display information sent to the terminal from the switch is buffered. When the state changes, the information displays.

The 7506 BRI voice terminal, which has a 2-line, 24-character display, splits a message when it recognizes a blank closest to the 24th character. This is left to the discretion of the terminal. As a result, the switch has no control over it.

## Intercept Treatment

---

Intercept Treatment provides an intercept tone or a recorded announcement or routes the call to an attendant for assistance when calls cannot be completed or when use of a feature is denied.

A Vector Directory Number (VDN) extension cannot be administered to receive intercept treatment.

### How to administer Intercept Treatment

---

#### Required forms

---

| Form                              | Field                              | Page                  |
|-----------------------------------|------------------------------------|-----------------------|
| Feature-Related System Parameters | ■ DID/Tie/ISDN Intercept Treatment | <a href="#">5-123</a> |
|                                   | ■ Controlled Restrictions          |                       |
| Announcements/Audio Sources       | ■ Port                             | <a href="#">5-26</a>  |

---

### Detailed description

---

#### Intercept Treatment — Tone

Intercept Treatment — Tone provides a siren-type tone to internal calls that cannot be completed as dialed.

Users hear the tone when they lift the handset and do not dial within 10 seconds, pause longer than 10 seconds between digits during the dialing process, or remain connected to Loudspeaker Paging Access for longer than an administered interval.

If a voice terminal is assigned a Class of Service (COS) with Off-hook Alert, and the user of that voice terminal receives a tone for a specified period of time and does not hang up, an emergency call is placed to the attendant.

On Direct Inward Dialing (DID) calls, if Multifrequency Compelled Signaling (MFC) Intercept Treatment is set to provide a tone, this tone is sent to the central office (CO) to indicate that the called number is not valid.

On DOD calls using MFC signaling, if the PBX receives MFC intercept tone from the CO indicating that the dialed number called is not valid, the PBX sends an intercept signal to the calling station.

## Intercept Treatment — Recorded Announcement

Intercept Treatment — Recorded Announcement provides a recorded announcement to DID and incoming Private Network Access calls that cannot be completed as dialed or that are transferred to incomplete or restricted stations. You select and record the message.

Toll charges do not apply to DID and Private Network Access calls routed to Intercept Treatment — Recorded Announcement.

## Intercept Treatment — Attendant

Intercept Treatment — Attendant allows attendants to provide information and assistance to callers on all DID or incoming Private Network Access calls that cannot be completed as dialed or that are transferred to incomplete or restricted stations. Normal toll charges apply to these calls.

## Intercept Treatment — Station

Intercept Treatment — Station allows a voice terminal to receive certain calls that cannot be completed because of a controlled restriction or because the called party has activated Do Not Disturb. Controlled restrictions that can be administered to send calls to station intercept are Outward, Termination, and Station-to-Station.

The calling party receives no indication that the call is receiving Intercept Treatment.

## Considerations

---

- Only one person can be connected to an analog or auxiliary trunk announcements at any given time. The caller is always connected to the beginning of the announcement.
- Integrated announcement boards have 16 channels and each channel can play the same announcement from the beginning. Therefore, up to 16 calls can be listening to the intercept announcement.

## Interactions

---

- MF Signaling

For DID MF signaling calls, whether the corresponding B.x signal or the intercept tone should be sent to the CO is administrable. The default is to send the standard DID/TIE/ISDN Intercept Treatment described in this section. If the option to send the B.x signal is set, then:

- For Group II calls, the B.x signal for the intercept is sent to the CO.
- For non-Group II calls, if the CO dials an invalid number, the trunk is locked (regardless of this option). If the CO dials a number that is valid but not assigned, intercept tone is sent to the CO.

- Recorded Announcement

Attendant Intercept and Recorded Announcement Intercept (both optional) cannot be used together. DID calls and private-network calls cannot be assigned Intercept Treatment — Tone.

## Intercom — Automatic

---

Intercom — Automatic provides a talking path between two voice-terminal users. Calling users press the Automatic Intercom button and lift the handset, or vice versa. Called users receive a unique intercom alerting signal, and the status lamp associated with the Automatic Intercom button, if provided, flashes.

### How to administer [Intercom — Automatic](#)

---

#### Required forms

---

| Form                      | Field  | Page                  |
|---------------------------|--|-----------------------|
| Intercom Group            | ■ All  | <a href="#">5-175</a> |
| Station (multiappearance) | ■ Button/Feature Button Assignments — auto-icom (Grp:__ DC:__) | <a href="#">6-14</a>  |

### Considerations

---

- Users who frequently call each other can do so by pressing one button instead of dialing an extension number.
- Single-line voice-terminal users can receive Automatic Intercom calls, but cannot originate them.
- A combination of Intercom — Automatic and Intercom — Dial can be used between terminals so that Intercom—Automatic applies in one direction and Intercom — Dial applies in the other.
- Two terminals with Intercom — Automatic to and from each other, or terminals with combined Intercom — Automatic and Intercom — Dial to each other, must be in the same Intercom group.

### Interactions

---

- Call Appearance
 

A station with Intercom — Automatic must have at least one Call Appearance translated. Intercom calls terminate to this call appearance and cause the appropriate feature button (auto-icom) to flash. Intercom calls cannot terminate to a bridged appearance.
- Call Coverage
 

Intercom calls are redirected only if the caller activates Go to Cover.
- Call Pickup/Directed Call Pickup
 

If on the Feature-Related System Parameters form, Call Pickup on Intercom Calls is set to **y**, Call Pickup and Directed Call Pickup can be used to answer an Automatic Intercom call. If the field is set to **n**,

## 4 Basic Features

### *Intercom — Automatic*

Page 4-394

Automatic Intercom calls cannot be picked up using Call Pickup or Directed Call Pickup. The calls are not included in the call-pickup alerting count.

- Class of Restrictions (COR)

You can administer COR so that station A cannot call Station B. In this case, Station A receives intercept tone when attempting a call. However, the same Station A can have Intercom — Automatic capability to Station B. In this case, A could call B via automatic intercom. Therefore, you need to use both station restrictions and Intercom groups to restrict a station from calling other stations.

- Data Privacy and Data Restriction

An extension with Data Privacy or Data Restriction activated cannot originate an intercom call. Intercept tone is received when the ICOM button is pressed under this condition.

- Intercom — Dial

This feature must be provided. Users assigned an Automatic Intercom button must be a member of the same Dial Intercom group as the destination extension.

- Single-Digit Dialing and Mixed Station Numbering

Prefixed extensions longer than five digits (including prefix) cannot be assigned to intercom lists.

## Intercom — Dial

---

Intercom — Dial allows multiappearance voice-terminal users to gain rapid access to other voice-terminal users within an administered group. Calling voice-terminal users lift the handset, press the Dial Intercom button, and dial the 1-digit or 2-digit code assigned to the desired party. The called user receives alerting tone, and the status lamp associated with the Intercom button, if provided, flashes.

### How to administer Intercom — Dial

---

#### Required forms

---

| Form                      | Field  | Page                  |
|---------------------------|--|-----------------------|
| Intercom Groups           | ■ All  | <a href="#">5-175</a> |
| Station (multiappearance) | ■ Button/Feature Button Assignments<br>— dial-icom (Grp: __) | <a href="#">6-14</a>  |

---

### Considerations

---

- A group of users who frequently call each other can do so by pressing a Dial Intercom button and dialing a code instead of an extension.
- Single-line voice terminals can receive Intercom — Dial calls, but cannot originate them.
- A combination of Intercom — Dial and Intercom — Automatic can be used between terminals so that Intercom — Dial applies in one direction and Intercom — Automatic applies in the other.
- A Intercom — Dial user can place an intercom call to all members in the group, including Intercom — Automatic members.
- Two terminals with Intercom — Dial to and from each other, or two terminals with combined Intercom — Dial and Intercom — Automatic to and from each other, must be in the same Intercom group.

### Interactions

---

- Call Appearance

A station with Intercom — Dial must have at least one Call Appearance translated. Intercom calls terminate to this call appearance and cause the appropriate feature button (dial-icom) to flash. Intercom calls cannot terminate to a bridged appearance.

- Call Coverage

Intercom calls are redirected to Call Coverage only if the caller activates Go to Cover.
- Call Pickup and Directed Call Pickup

If on the Feature-Related System Parameters form, `Call Pickup on Intercom Calls` is set to **y**, Call Pickup and Directed Call Pickup can be used to answer an Automatic Intercom call. If the field is set to **n**, Automatic Intercom calls cannot be picked up using Call Pickup or Directed Call Pickup. The calls are not included in the call-pickup alerting count.
- Data Privacy and Data Restriction

An extension with Data Privacy or Data Restriction activated cannot originate an intercom call. Intercept tone is received when the ICOM button is pressed under this condition.
- Intercom — Automatic

Users who are assigned this feature must be a member of a Dial Intercom group.
- Single-Digit Dialing and Mixed Station Numbering

Prefixed extensions longer than five digits (including prefix) cannot be assigned to intercom lists.

## Internal Automatic Answer

---

Internal Automatic Answer (IAA) provides convenient hands-free answering of internal calls to some voice-terminal users on most multifunction stations with a speakerphone or a headphone.

### How to administer IAA

---

#### Required forms

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature-Related System Parameters | <ul style="list-style-type: none"> <li>■ Internal Automatic Answer for Attendant Extended Calls</li> </ul> | <a href="#">5-123</a> |
| Station (multi-appearance)        | <ul style="list-style-type: none"> <li>■ All</li> </ul>  | <a href="#">6-28</a>  |

### Detailed description

---

An eligible call can be answered automatically via IAA if the user activates IAA at the answering voice terminal and the terminal is not active (on-hook and able to accept an incoming call). A voice terminal is active if it is off-hook, is in the process of dialing digits, or has a call on hold.

The following internal calls are eligible for IAA:

- Station-to-station voice calls, with both voice terminals on the same switch (includes redirected intraswitch calls)
- Internal call from another switch node in a DCS configuration when the origin of the call is known to be an internal, non-attendant voice terminal on that switch (includes redirected inter-DCS calls)
- Attendant-extended external calls if you enable `Internal Automatic Answer for Attendant Extended Calls`

The following calls are *not* eligible for IAA:

- Calls from public-network trunks (including PCOL)
- Calls from non-DCS tie trunks
- Automatic Callback calls
- Automatic Circuit Assurance calls
- Data calls
- Attendant-extended external calls if `Internal Automatic Answer for Attendant Extended Calls` is disabled

## 4 Basic Features

### Internal Automatic Answer

Page 4-398

- Calls that the system redirects because of a queue overflow of Emergency Access to the Attendant calls
- Calls when the receiving station's `Active Station Ringing` is set to **continuous**

## IAA Feature Operations

With IAA, you can assign a single programmable feature button (IAA) to voice terminals. When the user presses the IAA feature button, the button lamp lights and the system activates IAA. Pressing the same button again deactivates IAA and turns off the status lamp. (Pressing the feature button has no effect on a currently-active call or a ringing call.) The IAA button may be toggled on or off at any time, regardless of the state of the voice terminal. Using the speakerphone to place calls does not affect the state of IAA.

The calling voice terminal receives a tone when its call is answered automatically by a voice terminal with IAA. The called voice terminal receives a tone (a ring ping) and then goes off-hook when automatically answering an IAA-eligible call. The answering voice-terminal's speaker and microphone are both turned on.

If a voice-terminal user has IAA active and is currently busy on a call or is in the process of dialing digits, subsequent incoming calls are treated as if IAA were not activated.

## Considerations

---

- Voice-terminal users should always deactivate IAA when leaving the work area. Otherwise, incoming calls are unintentionally answered by the unattended station, and do not go to coverage.
- A 602A terminal is off-hook when the headset or speakerphone is connected. Therefore IAA answers a call if all other call appearances are idle.

## Interactions

---

- Attendant Console  
IAA is not available with Attendant Console.
- Automatic Answer  
You cannot administer both IAA and Automatic Answer simultaneously on the same voice terminal.
- Automatic Call Distribution  
IAA applies internal calls as an ACD agent extension in call.

## 4 Basic Features

### Internal Automatic Answer

Page 4-399

- Automatic Callback

Callback calls via Automatic Callback are not answered automatically by IAA.

- Automatic Circuit Assurance

Calls generated by ACA are not eligible for IAA.

- Bridged Call Appearance — Multiappearance Voice Terminal

Calls terminating on a bridged call appearance are not eligible for IAA at the bridged station, even if the bridged station has IAA active. (IAA can be used by the principal station to answer the call.)

- Bridged Call Appearance — Single-Line Voice Terminal

Calls terminating to a bridged call appearance are not eligible for IAA at the bridged station, even if the bridged station has IAA active.

- Call Coverage

If an internal call is redirected to another voice terminal by Call Coverage redirection criteria, then that call is eligible for IAA at the redirected voice terminal.

IAA does not apply to calls to the original called extension when:

- The called voice terminal has activated Send All Calls
- The calling voice terminal has selected Go to Cover before placing the call

Calls directed to a coverage answering group are not eligible for IAA.

 **NOTE:**

If you set the coverage path for a station to All Calls and that station activates IAA, the first coverage point hears a ring, the principal station automatically answers, and the coverage-simulated bridge is dropped. The coverage station rings, but is not able to answer the call because the coverage-simulated bridge has been dropped.

- Call Forwarding

Calls to a station with IAA and Call Forwarding active are forwarded and are not answered by the station dialed.

 **NOTE:**

If the forwarded-to station is internal and has IAA active, it automatically answers the redirected call.

- Call Park

If you are using Deluxe Paging and Call Park times out, the call returns to the originating station that parked the call and is eligible for IAA.

## 4 Basic Features

### *Internal Automatic Answer*

Page 4-400

- Call Pickup

Internal calls to a voice terminal in a Call Pickup group are eligible for IAA. If the called extension in a Call Pickup group has IAA-active, the call is automatically answered. A voice terminal with IAA active is not able to automatically answer calls to other voice terminals in its Call Pickup group.

- Conference

Internal conference calls can be answered automatically via IAA. If more than one party has joined a conference call through automatic answer, the parties remain connected until they disconnect or the controlling party drops the call.

- Data Call Setup

Data calls are not eligible for IAA.

- Direct Department Calling and Uniform Call Distribution

Internal calls to a DDC or UCD group member are eligible for IAA.

- Distributed Communications System

If a call is from an internal voice terminal on another switch in a DCS configuration, then that call is considered internal and is eligible for automatic answer.

- Do Not Disturb

Do Not Disturb preempts IAA at the called voice terminal.

- Go to Cover

IAA does not apply to calls to the original called extension when the calling voice terminal has selected Go to Cover before placing a call.

- ISDN-BRI

IAA is not available with ISDN-BRI terminals.

- Loudspeaker Paging — Deluxe Paging

When you are using Deluxe Paging and Call Park times out, the call returns to the originating station that parked the call and is eligible for IAA.

- Ringback Queuing

Automatic calls generated by Ringback Queuing are not eligible for IAA.

- Send All Calls

IAA does not apply to calls to extensions with Send All Calls is active.

- Terminating Extension Group

Calls to a Terminating Extension Group extension are not eligible for IAA. However, calls placed to an individual extension are eligible.

- Transfer

Transferred calls are eligible to be automatically answered via IAA.

## International Operator Access

---

International Operator Access allows DEFINITY ECS users in Mexico to make international calls to a central office (CO) operator directory assistance operator using administrable feature buttons on any digital communications system (DCP) telephone and attendant console using R2 multifrequency-compelled (MFC) signaling. This capability is also available in Hong Kong using dual-tone multifrequency (DTMF) signaling. It is possible for users in other countries to use this feature if their DEFINITY ECS is using R2 MFC or DTMF signaling. On R2 MFC signaling, pressing the mf-op-intl and mf-da-intl button causes I.11 and I.12 signals, respectively, to be sent out. On DTMF signaling, pressing the mf-op-intl and mf-da-intl button causes B and C signals, respectively, to be sent out.

### How to administer International Operator Access

---

1. On the third page of the station form, add **mf-op-intl** or **mf-da-intl** to the Feature Button Assignments field.

These are shown when you press the help button to view the administrable feature button choices.

2. Submit the change.

**NOTE:**

On the ARS Digit Analysis form, the pressing of one of these feature buttons is counted as one digit and the Mn and Mx fields should reflect this pressing of the feature button.

#### Required forms

---

| Form               | Field                        | Page                  |
|--------------------|------------------------------|-----------------------|
| Station            | ■ Feature Button Assignments | <a href="#">5-123</a> |
|                    | — mf-op-intl                 |                       |
|                    | — mf-da-intl                 |                       |
| ARS Digit Analysis | ■ Mn                         |                       |
|                    | ■ Mx                         |                       |

---

### Detailed description

---

- International calls to CO operators

A DEFINITY ECS user:

1. Dials the ARS access code
2. Dials the international access code

## 4 Basic Features

### *International Operator Access*

Page 4-402

3. Dials the country code
4. Presses the mf-op-intl button

Ringback, busy, or congestion tone is returned.

- International calls to directory assistance operators

A DEFINITY ECS user:

1. Dials the ARS access code
2. Dials the international access code
3. Dials the country code
4. Presses the mf-da-intl button

Ringback, busy, or congestion tone is returned

## **Considerations**

---

No more digits can be dialed after pressing the mf-op-intl or mf-da-intl feature buttons.

## **Interactions**

---

- Abbreviated Dialing

The mf-op-intl and mf-da-intl feature buttons cannot be programmed and embedded in abbreviated dialing strings.

- Authorization Code

The Authorization Code feature can be used with this feature.

## Last Number Dialed

---

Last Number Dialed allows a user to automatically redial the last number dialed.

The system saves the first 24 digits of the last number dialed, whether the call was dialed manually or with Abbreviated Dialing. When users press the Last Number Dialed button or dial the Last Number Dialed feature-access code, the system places the call again.

### How to administer Last Number Dialed

---

#### Required forms

---

| Form                      | Field  | Page                  |
|---------------------------|--|-----------------------|
| Feature Access Code (FAC) | ■ Last Number Dialed Access Code                   | <a href="#">5-113</a> |
| Station (multiappearance) | ■ Button/Feature Button Assignments<br>— last-numb | <a href="#">6-14</a>  |
| Attendant Console         | ■ Feature Button Assignments<br>— last-numb        | <a href="#">5-35</a>  |

---

### Considerations

---

- Any special characters (Pause, Wait, Mark, or Suppress) that are stored in an Abbreviated Dialing button are outpulsed when the number is redialed.
- Any delays in manual dialing are not reflected when the number is redialed.
- The system does not save Last Number Dialed information to disk, tape, or flash card. The system never saves manually-dialed end-to-end, signaling digits.
- A user can enter a partial number, hang up, and use Last Number Dialed, and manually enter the remaining digits. If the user calls from a display terminal, the manually-entered digits do not display during the dialing sequence, but the system successfully completes the call.

### Interactions

---

- Abbreviated Dialing  
If the previously-called number was in an Abbreviated Dialing privileged list and the user's COR normally prevents the user from dialing the number, the system uses Intercept Treatment when the user presses Last Number Dialed. To redial the number, the user must again use the Abbreviated Dialing privileged list.

4 Basic Features

*Last Number Dialed*

Page 4-404

- Automatic Callback

Users can use Automatic Callback after they use Last Number Dialed on a call to an internal voice terminal.

- Bridged Call Appearance

Last Number Dialed causes the last number dialed from the voice terminal to be redialed, regardless of which extension number is used (primary or bridged call appearance).

- Centralized Attendant Service

Last Number Dialed does not work with CAS. Therefore, if a CAS attendant attempts to extend a call via Last Number Dialed, the call does not complete.

## Leave Word Calling

---

Leave Word Calling (LWC) allows internal system users to leave a short preprogrammed message for other internal users. When the message is stored, the Automatic Message Waiting lamp on the called voice terminal lights. Users can retrieve LWC messages using a telephone display, Voice Messaging Retrieval, or AUDIX. Messages may be retrieved in English, French, Italian, Spanish, or a user-defined language.

DEFINITY ECS also provides voice synthesis (either English or Italian) for LWC, depending on which voice-synthesis circuit pack is installed in the system.

### How to administer LWC

---

#### Required forms

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature-Related System Parameters | <ul style="list-style-type: none"> <li>■ Max. Number Of Messages Per Station</li> </ul>                    | <a href="#">5-123</a> |
|                                   | <ul style="list-style-type: none"> <li>■ Message Waiting Lamp Indicates Status For</li> </ul>              |                       |

|                                   | <ul style="list-style-type: none"> <li>— call-disp</li> </ul>  |                       |
|                                   | <ul style="list-style-type: none"> <li>— msg-retr</li> </ul>   |                       |
| Attendant Console                 | <ul style="list-style-type: none"> <li>■ Feature Button Assignments</li> </ul>                             | <a href="#">5-35</a>  |
|                                   | <ul style="list-style-type: none"> <li>— lwc-store</li> </ul>  |                       |
|                                   | <ul style="list-style-type: none"> <li>— lwc-cancel</li> </ul>   |                       |
|                                   | <ul style="list-style-type: none"> <li>— delete-msg</li> </ul>   |                       |
|                                   | <ul style="list-style-type: none"> <li>— next</li> </ul>   |                       |
|                                   | <ul style="list-style-type: none"> <li>— call-disp</li> </ul>  |                       |
|                                   | <ul style="list-style-type: none"> <li>— aut-msg-wt (Ext:___)</li> </ul>                                   |                       |

### Required forms — *Continued*

| Form                      | Field                          | Page                  |
|---------------------------|--------------------------------|-----------------------|
| Feature Access Code (FAC) | ■ LWC Message Retrieval Lock   | <a href="#">5-113</a> |
|                           | ■ LWC Message Retrieval Unlock |                       |
|                           | ■ LWC Send A Message           |                       |
|                           | ■ LWC Cancel A Message         |                       |

### Detailed description

LWC electronically stores a standard message — for example, CARTER, ANN 2/7 10:45a 2 CALL 3124. This message means that Ann Carter called two times, the last time on the morning of February 7, and wants a return call to extension 3124.

When the system receives identical messages, only the date, time, and number of messages are updated. If nine or more identical messages accumulate, the count remains at nine, and only the date and time are updated.

Messages can be stored by calling users, called users, and covering users as follows:

- Calling user
  - Before dialing the desired extension number, press the LWC button or dial the LWC access code. Then dial the desired number.
  - Before the call is answered, if you are a multiappearance voice-terminal user, press LWC. If you are a single-line voice-terminal user, press Recall and dial the access code.
  - After the call is answered, press LWC or Recall and dial the access code.
- Called user
  - After answering the call, the called user presses LWC to leave a message for the calling user to return their call. (A called user can store an LWC message by dialing the LWC access code only if the called user has an analog voice terminal.)

## 4 Basic Features

### Leave Word Calling

Page 4-407

- Covering user
  - A covering user can be through Call Coverage, Call Pickup, or Call Forwarding All Calls.
  - After answering the call, the covering user presses Coverage Callback to store a message for the called user that tells them to return a call the calling user.
  - After answering the call, the covering user presses LWC to leave a call-me message for the originally called user.

In addition, a user that was placed on hold can activate LWC and leave a message for the holding user to place a return call.

A caller who leaves an LWC message can cancel that message, if it has not already been retrieved. To cancel the message, the calling user lifts the handset, presses LWC Cancel or dials the access code, and then dials the extension of the called party.

The system can indicate that one voice terminal received a LWC message on a second voice terminal. The system lights a remote Automatic Message Waiting lamp at the remote voice terminal and the Automatic Message Waiting lamp lights at the called voice terminal. The Remote Automatic Message Waiting lamp is a status lamp associated with a button assigned for this purpose. Thus, an assistant's voice terminal could light when an executive receives a LWC message. If the executive calls to retrieve messages, the assistant knows at a glance if any messages have been left.

Users without Voice Terminal Display can have their messages retrieved by a system-wide message retriever or by covering users in their Call Coverage path. They can also use Voice Message Retrieval.

The system restricts unauthorized users from displaying, canceling, or deleting messages. The Lock function restricts a voice terminal and the Unlock function releases the restriction. Users activate Lock by dialing a system-wide access code. They cancel Lock by first dialing a system-wide access code and then an Unlock security code unique to the voice terminal. These functions apply only to the voice terminal where the function is active. You can assign a status lamp to show the lock status of the voice terminal.

## Considerations

- You can administer up to 10 terminals (or nine terminals and the attendant console group) as system-wide message retrievers.
- If the stored-message level reaches 95 percent of capacity, the status lamps associated with all Coverage Message Retrieval buttons in the system flash. These lamps continue to flash until the stored-message level

## 4 Basic Features

### Leave Word Calling

Page 4-408

falls below 85 percent. Authorized retrievers can selectively delete messages to gain storage space. Old messages are not purged automatically by the system.

- LWC messages cannot be stored, canceled, or retrieved for Vector Directory Number extensions.

## Interactions

---

- AUDIX Interface

LWC Cancel cannot be used to cancel an AUDIX message.

- Bridged Call Appearance

A LWC message left by a user on a bridged call appearance leaves a message for the called party to call the primary extension for the bridged call appearance. When a user calls a primary extension and activates LWC, the message is left for the primary extension, even if the call was answered at a bridged call appearance.

- Call Coverage

You can use LWC with or without Call Coverage. However, the two features complement each other. The Coverage Callback option of Call Coverage is provided by LWC. Also, a caller can activate LWC for the called party even if the call has been answered by a covering user.

- Centralized Attendant Service

LWC Message Retrieval does not work with CAS.

- Conference

A member of a conference call cannot activate LWC because the user cannot be uniquely identified. After LWC has been activated for a party on a conference or transfer, the conference or transfer originator cannot press Conference/Transfer a second time to return to the original call. The originator must select the call appearance button to return to the previously-held call.

- Expert Agent Selection

With EAS, the Message lamp defaults to tracking the status of messages waiting for the logged-in EAS agent rather than for the physical terminal. You can assign the Message lamp to track the status of messages waiting for the physical terminal.

- MERLIN/System 25 Voice Terminal — 731xH Series Support

MERLIN/System 25 7309H, 7313H, 7314H, 7315H, 7316H, and 7317H voice terminals support LWC but do not support Message Retrieval via the display.

- Vector Directory Number

LWC messages cannot be stored, cancelled, or retrieved through VDN.

## Line Lockout

---

Line Lockout removes single-line voice-terminal extensions from service when users do not hang up after receiving dial tone for 10 seconds or intercept tone for 30 seconds (default).

### How to administer Line Lockout

---

#### Required forms

---

| Form                              | Field                        | Page                  |
|-----------------------------------|------------------------------|-----------------------|
| Feature-Related System parameters | ■ Time before Off-hook Alert | <a href="#">5-123</a> |
|                                   | ■ Line Intercept Tone Timer  |                       |

---

### Detailed description

---

Line Lockout occurs when:

- A user does not hang up after the other party on a call is disconnected.  
The user receives the dial tone for 10 seconds and then receives the intercept tone for 30 seconds. If the handset remains lifted, the voice-terminal is taken out of service.
- A user pauses for 10 seconds between digits while dialing.  
The user receives intercept tone for 30 seconds. If the handset remains lifted, the voice-terminal is taken out of service.

The out-of-service condition remains in effect until the user hangs up.

### Considerations

---

- The out-of-service condition provided by Line Lockout does not tie up switching facilities.
- Line Lockout does not apply to multiappearance voice-terminals.

### Interactions

---

- Intercept Treatment  
Call intercept is provided by Intercept Treatment.

## Listed Directory Numbers

---

Listed Directory Numbers (LDN) has two capabilities that allow outside callers to access your attendant group, depending on the type of trunk used for the incoming call. You use one capability to allow attendant group access via incoming direct inward dial (DID) trunks. You use another capability to allow attendant group access via incoming central office (CO) and foreign exchange (FX) trunks.

### How to administer LDN

---

#### Required forms for incoming DID calls

---

| Form                     | Field | Page                  |
|--------------------------|-------|-----------------------|
| Listed Directory Numbers | All   | <a href="#">5-207</a> |

- Listed Directory Numbers Form
  - Assign listed directory numbers.
  - Assign an optional, associated night-service destination.

#### Required forms for incoming CO or FX trunk calls

---

| Form        | Field                  | Page                  |
|-------------|------------------------|-----------------------|
| Trunk Group | ■ Incoming Destination | <a href="#">7-115</a> |
| — CO        |                        | <a href="#">7-168</a> |
| — FX        |                        | <a href="#">7-193</a> |

### Detailed description

---

The system routes both incoming DID calls and incoming FX and CO calls to an attendant group, depending on how you administer the trunks.

### How the system routes incoming DID trunk calls to the attendant group

Incoming DID calls route only to an extension. The LDN feature allows you to assign one or more extensions to an attendant group. The system uses the LDN extension, or extensions, to route calls to an attendant group.

## How the system routes incoming FX and CO trunk calls to the attendant group

Incoming FX and CO trunks can terminate at an attendant group, although you administer your system to terminate the calls elsewhere. You can administer the system to terminate an incoming FX or CO trunk to one of the following:

- Attendant group
- Extension (This could be a VDN, an ACD split, a DDC group, a UCD group, a remote access extension, or any system extension.)

If you decide to terminate the call at the attendant group, *the system treats the call as an LDN call.*

## Considerations

---

The number of listed directory numbers that you can assign depends on your system's configuration. See *DEFINITY Enterprise Communications Server System Description Pocket Reference* for capacity information.

## Interactions

---

- Night Service

If you activate night-service capability and a night console is not assigned or is not operational, incoming LDN calls route as follows:

- DID LDN calls route to a designated DID LDN night extension. If no DID LDN night extension is designated, DID LDN calls route to the attendant.
- Incoming CO or FX trunk calls route to the night destination specified for the trunk group. If no night destination is specified for the trunk group, the calls route to the normal incoming destination for that trunk group.
- Internal calls and coverage calls to the attendant route to the DID LDN night extension during night service.

## Loudspeaker Paging Access

Customers can have either normal Loudspeaker Paging Access or Deluxe Loudspeaker Paging Access (called Deluxe Paging). Deluxe Paging provides attendants and voice-terminal users with integrated access to voice-paging equipment and Call Park capabilities. When a user activates Deluxe Paging, the call is automatically parked. The parked call returns to the parking user with distinctive alerting when the Call Park Time-out interval expires.

Loudspeaker Paging Access provides attendants and voice-terminal users dial access to voice-paging equipment. The system can provide as many as 9 individual paging zones. In addition, 1 zone can be provided by the system to activate all zones simultaneously. (A zone is the location of the loudspeakers — for example, conference rooms, warehouses, or storerooms.)

### How to administer Loudspeaker Paging Access and Deluxe Paging

#### Required forms

| Form                              | Field   | Page                  |

| Dial Plan Record                  | ■ All   | <a href="#">5-99</a>  |
| Second Digit Table                | ■ All   | <a href="#">5-264</a> |
| Console Parameters                | ■ Common Shared Extensions  | <a href="#">5-86</a>  |
| Class of Service                  | ■ Console Permission  | <a href="#">5-81</a>  |

#### Detailed description

The system assigns an individual trunk-access code for each of 10 paging zones. Users activate Loudspeaker Paging Access by dialing the trunk access code (TAC) of the desired zone. Users then speak into the handset to make an announcement.

## 4 Basic Features

### *Loudspeaker Paging Access*

Page 4-413

You can store trunk-access codes in Abbreviated Dialing lists. Multiappearance voice-terminal users can then activate paging by pressing Abbreviated Dialing buttons. Attendants can also activate paging by pressing a Direct Trunk Group select button if the desired zone's trunk-access code is assigned to one of the buttons.

In addition to the system loudspeaker paging equipment, you can use a PagePac paging system. The switch paging system requires a separate port for each paging zone, and provides only 9 zones. A PagePac system requires only one port on one circuit pack to provide as many as 39 paging zones.

Loudspeaker Paging Access is particularly useful when used with Call Park. When one user is away from their desk and receives a call, another user can answer the call, park it, and page the called party to tell them that extension to call to retrieve the call. The called party dials the Answer-Back access code and the extension to retrieve the parked call. Note that without Deluxe Paging, paging and parking are two separate operations.

### **Detailed description of Deluxe Paging**

Deluxe paging is similar to Loudspeaker Paging Access, but Deluxe Paging adds the convenience of automatically parking a call. When one user is away from their desk and receives a call, another user can answer the call, and then automatically park the call. The user dials the Loudspeaker Paging TAC (which automatically parks the call) and pages the called party to tell them they have a call. The called party dials the Answer-Back TAC to retrieve the call.

Deluxe Paging also provides Meet-Me Paging and Meet-Me Conferencing functions. With Meet-Me Paging, a user activates Deluxe Paging, makes the announcement for someone to call them back, and hang up. The paged party then calls the paging party. With Meet-Me Conferencing, a user pages another party and adds the party onto a conference call when they call the paging party.

## How to administer PagePac Paging

To use a PagePac paging system, assign a trunk-access code or extension (PagePac 50/100/200 only) to the paging system.

### Required forms

| Form                              | Field                        | Page                  |
|-----------------------------------|------------------------------|-----------------------|
| CPE trunk group                   | ■ All                        | <a href="#">7-174</a> |
| Feature-Related System Parameters | ■ Call Park Timeout Interval | <a href="#">5-123</a> |
| Dial Plan Record                  | ■ All                        | <a href="#">5-99</a>  |
| Second Digit Table                | ■ All                        | <a href="#">5-264</a> |
| Console Parameters                | ■ Common Shared Extensions   | <a href="#">5-86</a>  |
| Class of Service                  | ■ Console Permission         | <a href="#">5-81</a>  |

If you want users to access the PagePac system through a CO or analog station, do not administer the paging system on the Loudspeaker Paging Access form. The system accesses the line as a standard trunk (trunk access code of a CO) or a standard extension (dialed extension that connects to PagePac).

## Detailed description of PagePac Paging

A user simply dials the trunk-access code for the PagePac system to connect to the PagePac equipment. If there is only one paging zone, the user then pages from their handset. If there are multiple zones, the user waits for a steady tone, dials a 1-digit or 2-digit code to access the desired zone, then pages.

Three PagePac paging systems are available:

- PagePac 20  
Provides 1 paging zone. Has an input source for music over the paging system. The music can also serve as the music for the Music-on-Hold Access feature. Additional hardware is available to provide multizone paging for 3, 9, or 39 paging zones.
- PagePac VS  
Provides 1 to 3 paging zones. Permits paging to all zones simultaneously. Additional hardware is available to provide music or talkback.
- PagePac 50/100/200  
Provides up to 24 paging zones. Additional hardware is available to provide music or talkback.

## End user procedures for Deluxe Paging

How users activate Deluxe Paging varies depending on the type of voice terminal they have and whether they are attendants. The following sections explain how users activate Deluxe Paging in various environments.

### **Activating Deluxe Paging: single-line voice-terminal users**

1. Go off-hook to get dial tone.

If already on a call with another party, press the Recall button or flash the switchhook. The other party is placed on hold and you hear recall dial tone.

2. Dial the trunk-access code for the desired paging zone.

You hear dial tone.

3. Dial the extension where the call is to be parked.

You hear a confirmation tone. To park the call on your own extension, dial # instead of the extension.

4. Make the announcement.

The loudspeaker paging timer starts.

5. Press the Recall button and go on-hook.

The paging equipment is released, the parked call waits to be answered, and the timer for the Call Park Time-out interval starts.

If another party was placed on hold in Step 1 and did not go on-hook, that party and you are in conference, parked on the call, and connected to the paged party when he or she answers the call. (This is known as Meet-Me Conferencing.)

If the loudspeaker paging time-out interval expires before you press the Recall button, you receive a confirmation tone, the paging equipment is released, the call is automatically parked on your extension, and the calling party hears music (if provided). When the paged party answers the call, he or she is connected to you. You can then transfer the call to the calling party.

If the Call Park Time-out interval expires, the call returns to you with the proper distinctive alerting (such as, 1 burst for internal calls and conference calls with both internal and external parties; 2 bursts for external calls). If unanswered, the call follows your coverage path.

If no answer-back is required on the call, hang up instead of pressing the Recall button. The parked call is dropped and the paging equipment is released.

### **Activating Deluxe Paging: multiappearance, voice-terminal users**

1. Go off-hook to get dial tone.

If already on a call with another party, press the Transfer button. The other party is placed on hold and you hear dial tone.

2. Dial the trunk-access code for the desired paging zone.

You hear dial tone.

3. Dial the extension where the call is to be parked.

You hear confirmation tone. To park the call on your own extension, dial # instead of the extension.

4. Make the announcement.

The loudspeaker paging timer starts.

5. Press the Transfer button and go on-hook.

The paging equipment is released, the call is parked and is now waiting to be answered, and the timer for the Call Park Time-out interval starts.

If another party was placed on hold in Step 1 and you did not hang-up, that party is parked on the call and you are connected in conference when they answer the call. You can press the Conference button instead of the Transfer button to allow all the parties to connect to you on answer-back.

If the loudspeaker paging time-out interval expires before you press the Recall button, you receive a confirmation tone, the paging equipment is released, the call is automatically parked on your extension, and the calling party hears music (if provided). When the paged party answers the call, he or she is connected to you. You can then transfer the call to the calling party.

If the Call Park Time-out interval expires, the call returns to you with the proper distinctive alerting (such as, 1 burst for internal calls and conference calls with both internal and external parties; 2 bursts for external calls). If unanswered, the call follows your coverage path.

If no answer-back is required on the call, hang up instead of pressing the Transfer or Conference button. The parked call is dropped and the paging equipment is released.

### **Activating Deluxe Paging: attendant for another party**

1. Press the Start button.

The other party is placed on hold and you hear dial tone.

2. Dial the trunk-access code for the desired paging zone.

You hear dial tone.

3. Dial the extension where the call is to be parked.

You hear confirmation tone. To park the call on your own extension (if assigned), you dial # instead of the extension.

## 4 Basic Features

### Loudspeaker Paging Access

Page 4-417

#### 4. Make the announcement.

The loudspeaker paging timer starts.

#### 5. Press the Release button.

The paging equipment is released, the parked call waits to be answered, and the timer for the Call Park Time-out interval starts. If the you press the Split button, the timer for the Call Park Time-out interval starts, and both the held party and you are parked and connected to the call upon answer-back.

If the loudspeaker paging time-out interval expires before you press the Release button, you receive confirmation tone, the paging equipment is released, the call is automatically parked on the console, and the calling party hears music (if provided). When the paged party answers the call, they are connected to you. You can then transfer the call to the calling party.

### Activating Deluxe Paging: answer-back by the paged party

#### 1. Go off-hook to get dial tone.

#### 2. Dial the answer-back feature access code.

You hear dial tone.

#### 3. Dial the extension number where the call is parked, or dial # if the call is parked on the extension you are using.

Music-on-Hold, if provided, is removed from the parked call, all parties associated with the parked call receive confirmation tone, and the answer-back and parked parties are connected.

### Unparking a Loudspeaker Paging Call

#### 1. Press the lighted Call Park button.

## Considerations

---

### Considerations for Loudspeaker Paging

- An LDN or DID call cannot be connected to the paging facility. However, the attendant can page and park an incoming call.
- Normally, a user who is busy on a single-line voice terminal hears a call-waiting tone. If that user is in the process of paging, a call-waiting tone is not heard.
- You cannot use a PagePac paging system for Code Calling Access with multizone paging. PagePac systems expect a 2-digit code to access a particular zone. The system, however, immediately plays the chime code once a connection is established.

## Considerations for Deluxe Paging

- An LDN or DID call cannot be connected to the paging facility. However, the attendant can page a user and park an incoming call.
- Remote users (such as Remote Access users and tie-trunk users) cannot use # to park calls on their own extensions.

## Interactions

---

### Interactions with Loudspeaker Paging

The following features cannot be used with Loudspeaker Paging:

- Attendant Conference
- Terminal Conference
- Data Call Setup
- Hold
- Ringback Queuing
- Transfer

### Interactions with Deluxe Paging

- Bridged Call Appearance

If a parked call includes a shared Terminating Extension Group, a shared PCOL, or a redirected call with a Temporary Bridged Appearance, the maximum number of off-hook parties on the call is five, instead of six. The sixth position is reserved for the answer-back call.
- Call Coverage

If a coverage call is parked by Deluxe Paging, the Temporary Bridged Appearance at the principal extension is maintained as long as the covering user remains off-hook or places the call on hold.
- Call Park

A call cannot be parked on more than one extension at a time.

More than one call cannot be parked at the same extension at a time.

Call Park provides common shared extensions for use by attendants or by voice-terminal users with console permissions. These extensions are not assigned to a voice terminal, but are stored in system translations and used to park a call. These extensions are useful when one party is paged at the request of another party. The calling party is parked by Deluxe Paging and the extension is announced. Common shared extensions should be assigned to the optional selector console in any hundreds group that the attendant can easily identify. The extension lamp identifies call parked or no call parked (instead of active or idle status).

## 4 Basic Features

### Loudspeaker Paging Access

Page 4-419

If the Call Park Time-out interval expires during Deluxe Paging, the call normally returns to the paging user. However, with Remote Access and Tie Trunk Access, the call returns to the attendant. If unanswered, the call follows the coverage path of the paging user.

#### ■ Call Pickup

If a Call Pickup call is parked by Deluxe Paging, the Temporary Bridged Appearance at the principal extension is maintained as long as the answering pickup-group member remains off-hook or places the call on hold.

#### ■ Call Waiting Termination

Normally, a user who is busy on a single-line voice terminal hears call-waiting tone when a new call arrives. If that user is in the process of paging, call-waiting tone is not heard.

#### ■ Code Calling Access

You cannot use a PagePac paging system for Code Calling Access with multizone paging. PagePac systems expect a 2-digit code to access a particular zone. The system, however, immediately plays the chime code once a connection is established.

#### ■ Conference — Attendant

The maximum number of conferees on a parked Deluxe Paging call is five. The sixth conferee position is reserved for the answer-back call.

A Deluxe paging call cannot be conferenced unless a party was placed on hold and parked with the call. This is because paging equipment cannot be placed on hold.

#### ■ Conference — Terminal

Multiappearance voice terminals can have up to 5 conferees on a parked Deluxe Paging call. The sixth conferee position is reserved for the answer-back call.

Single-line voice terminals can have up to 2 conferees on a parked Deluxe Paging call.

A Deluxe paging call cannot be conferenced unless a party was placed on hold and parked with the call. This is because paging equipment cannot be placed on hold.

#### ■ Data Call Setup

If the Data button has been pressed for modem pooling, access to Deluxe paging is denied.

#### ■ Data Privacy

If a call, with Data Privacy activated, is parked by Deluxe Paging, Data Privacy for that call is automatically deactivated.

## 4 Basic Features

### Loudspeaker Paging Access

Page 4-420

- Hold

Deluxe Paging facilities cannot be placed on hold.
- Hunt Groups

If a hunt-group member parks a call using Deluxe Paging, the call is parked on the member's own extension, not the hunt-group extension.
- Leave Word Calling

If a user parks a call for his or her extension with the Conference button, any parking or parked parties cannot activate LWC because that party cannot be uniquely identified.
- Manual Originating Line Service

Users assigned Manual Originating Line Service cannot access Deluxe Paging.
- Music-on-Hold Access

Music-on-Hold, if provided, is connected to the parked party when only one conferee is left on the parked call. Music-on-Hold is not connected to a parked call with more than one conferee.
- Multiple LDNs

An LDN call cannot be connected to a Deluxe Paging facility.
- Night Service

If a night-station user parks a Night Service call with Deluxe Paging, the call is parked on the night station's primary extension.
- Personal Central Office Line

If a PCOL call is parked by Deluxe Paging, the Temporary Bridged Appearance of the call is maintained at the PCOL extension until the call is disconnected.
- Remote Access

Remote Access users can access Deluxe Paging unless they are restricted by COR from doing so.
- Ringback Queuing

Ringback Queuing is not provided for Deluxe Paging.
- Terminating Extension Group

If a TEG member parks a call using Deluxe Paging, the call is parked on the member's own individual extension not the TEG extension. You cannot park calls on a TEG extension by dialing the extension as a call-park destination.

**4 Basic Features**

*Loudspeaker Paging Access*

*Page 4-421*

- **Transfer**

A Deluxe paging call cannot be transferred unless a party was placed on hold and parked with the call. The reason for this is that paging equipment cannot be placed on hold.

## Malicious Call Trace

---

Malicious Call Trace (MCT) allows you to trace malicious calls. MCT allows you to define a group of terminal users who can notify others in the group when they receive a malicious call. These users then can retrieve information related to the call. Using this information, you can identify the malicious call source or provide information to personnel at an adjacent switch to complete the trace. MCT also allows you to record the malicious call.

You allow users in the group to activate MCT and/or to control malicious call trace. The controlling terminal user, or controller, receives the information that MCT collects on the call.

### How to administer MCT

---

#### Required forms

| Form  | Field   | Page  |
|---|---|---|
| Class of Restriction                                  | ■ Access to MCT   | <a href="#">5-72</a>  |

## ISDN MCT Notification

The following describes how to administer the ISDN MCT notification for an ISDN trunk group (public-ntwrk, tandem, tie, or access).

### Required Forms for ISDN-PRI

| Form                              | Field              | Page                  |
|-----------------------------------|--------------------|-----------------------|
| System-Parameter Customer-Options | ■ ISDN-PRI         | <a href="#">5-277</a> |
| DS1 Circuit Pack                  | ■ Country Protocol | <a href="#">7-79</a>  |
|                                   | ■ Protocol Version |                       |
|                                   | ■ Peer Protocol    |                       |

Display the System-Parameter Customer-Options form and ensure that ISDN is enabled. One of the following must be set on the DS1 form:

- If the DS1 is connected to the public network in Australia, set `Country Protocol` field to **2**.
- For a private network of DEFINITY systems, set `Country Protocol` to **1** and `Protocol Version` to **a**. This is recommended if DCS features are used in the private network.
- For a private network of DEFINITY systems, set `Peer Protocol` to **q-sig**. (`Peer Protocol` appears on the DS1 form when `Signaling Mode` field is **isdn-pri**, `Connect` field is **pbx**, and `Interface` field is **peer-master** or **peer-slave**.)

### Required Forms for ISDN-BRI

| Form                              | Field             | Page                  |
|-----------------------------------|-------------------|-----------------------|
| System-Parameter Customer-Options | ■ ISDN-BRI Trunks | <a href="#">5-277</a> |
| ISDN-BRI Trunk Circuit Pack       | ■ Interface       | <a href="#">7-79</a>  |

Display the System-Parameter Customer-Options form and ensure that ISDN is enabled. One of the following must be set on the ISDN-BRI Trunk Circuit Pack form:

- If the ISDN-BRI is connected to the public network in Australia, set `Country Protocol` field to **2**.
- For a private network of DEFINITY systems, set `Interface` to **peer-master** or **peer-slave**.

## Detailed description

---

### MCT Voice Recorder

The MCT Voice Recorder is any type of audio recorder (for example, a standard audio cassette player) that you can control via the DEFINITY TN763 Auxiliary Trunk board. To record the call, manually place the MCT Voice Recorder in "Record" mode. The station user then activates the MCT feature which applies power to the recorder (via the connected Auxiliary Trunk's control signal interface).

### Activating MCT

To activate MCT while on an active malicious call, perform one of the following:

- Push an MCT-Activate feature button
- Place the call on hold, get a second call appearance, and dial an MCT-Activate Feature Access Code (FAC). After the dial tone, the user then dials their own extension, presses #, or waits for a 10-second timeout.
- Signal another user in the defined group to activate MCT. The co-worker activates MCT, waits for the dial tone, and dials the call recipient's extension.
- Inform a controller, who can request that another switch continue tracing the call.

The switches must be tandemed. The controller on the first switch supplies the trunk member port id to be traced. The controller on the second switch activates MCT and presses \*, followed by the trunk port id. The letters A through E of a port id are entered as 1 through 5 on the station keypad. For example, trunk port id 01C0401 would be entered as 0130401.

Once MCT is activated, information on the call is collected and alerts users in the group. The alert is not a call, so it is not affected by queues at the user's terminal. If an MCT Voice Recorder is connected, it begins recording the conversation.

#### NOTE:

Any Bridging, Conference, or Intrusion tone connected to parties on the connection are temporarily removed while the MCT Voice Recorder connects.

### Controlling MCT

The first controlling terminal to respond to an MCT alert becomes the controller for the call. Alerting on any other controlling terminals stops.

During alerting, the controller's display shows the message "MALICIOUS CALL TRACE REQUEST." While this message displays, no information on incoming calls displays.

When the controller pushes the MCT-Control button, information displays identifying the called party. When the controller pushes the button again the remaining MCT information displays, as the following example shows:

**Page 1 "MALICIOUS CALL TRACE REQUEST"**

**Page 2 "MCT activated by: 1002 for: 51001"**

**Page 3 "original call redirected from: 52001"**

**Page 4 "voice recorder port: 01C0104:"**

**Page 5 "party2: 01C1505 <PORT ID>" or "party2: 01C1505 <ISDN PORT ID>"**

**Page 6 "party3: 52001 <EXTENSION>:" or "party3: 52001 <ISDN PORT ID>"**

**Page 7 "END OF TRACE INFORMATION"**

MCT collects and displays three types of information, calling information as follows:

- If the call originated inside the system or on the same node within a DCS network, the calling number displays.
- If the call originates outside the system and an ISDN calling number identification is available on the incoming trunk, then the calling number displays. Otherwise, the incoming trunk-equipment location displays. In this case, the user must call the connecting switch.

For all calls, the system displays the called number, the activating number, whether the call is active, and identification of any other parties on the call.

## Deactivating MCT

The controller deactivates MCT by dialing the MCT-Deactivate FAC. Deactivation frees resources involved in the trace that were blocked. When all parties hang up, the MCT Voice Recorder disconnects.

## Considerations

---

- Trunks involved in MCT are blocked from dropping to facilitate tracing. Terminals involved in a malicious call are not blocked from dropping.
- Except for Emergency Access to the Attendant, features that normally display information do not do so on a controlling terminal. Otherwise, these features function normally until MCT deactivates.

## 4 Basic Features

### Malicious Call Trace

Page 4-426

- Do not use FACs to activate MCT because the process takes users too long.
- Visually Impaired Attendant Service (VIAS) voices-out display information for MCT activation, but not for MCT control.
- MCT information on an active malicious call is lost during a switch failure.
- When directing a trace to an adjacent switch, consider the following:
  - The malicious caller may hear a warning tone as a result of the intrusion.
  - You may lose continuity on the trace because the person activating MCT on the second switch may not be the MCT controller.
- If a malicious call comes in on a non-ISDN trunk, the controller needs the telephone number for the connecting switch and a cross-reference of system-trunk port numbers (including DS1 channel number, if appropriate) not the trunk equipment locations at the connecting switch. Be sure that they have this information.
- The following are the system initiated operations for MCT:
  - Conversation Recording — After the user activates MCT, the system attaches a MCT Voice Recorder, if available, to record the conversation, if available.
  - Historical Recording — After the user activates MCT, the system records the MCT-information that you can subsequently retrieve via the MCT History Administration form.

## Interactions

- Bridged Appearance — Temporary

If a controller activates a trace, the original called party can bridge on to the call.
- Bridged Call Appearance

If a user at a primary extension receives an indication call, then a station with a bridged call appearance of this extension can bridge on to the call. For an MCT-Activate button push, if the currently active extension is a bridged appearance, the system records the primary extension as the MCT recipient.

For an MCT-Activate FAC, the user dials the number of the terminal with the bridged call appearance that is actually on the call, instead of the bridged number. However, the system logs the primary extension as the recipient. Likewise, for self-originated MCT activations via FAC, the system logs the primary extension as the MCT recipient provided that the recently held appearance is a bridged call appearance. When you activate MCT for yourself, dial # or wait for interdigit timeout.

## 4 Basic Features

### *Malicious Call Trace*

Page 4-427

- Call Waiting

A call cannot wait on the line of a malicious call recipient when MCT is activated. Instead, the MCT recipient's line appears busy.
- Conference

A user can use conferencing to place a malicious caller on hold. The user can initiate conferencing and enter the MCT-Activate FAC, then stop conferencing and return to the malicious caller's appearance.

MCT-Activate can be generated for a member of a conference and is not affected by the number of parties on the conference.
- Centralized Attendant Service

MCT-Activate, MCT-Control, and MCT-Deactivate must be performed by terminals within the same PBX.
- DCS

If a voice terminal in a DCS network is involved in a malicious call, the extension is recorded and displayed with the MCT information. MCT notification passes over ISDN-PRI DCS trunks but MCT-Activate, MCT-Control, and MCT-Deactivate must be performed by terminals within the same DCS node.
- Emergency Access to the Attendant

Ordinarily, during MCT-Control no other feature can access the controlling terminal's display. However, MCT gives up control of the display until the Emergency Access call has completed.
- Individual Attendant Access

An attendant can receive an MCT alert to their individual attendant access extension, if the console is not busy. However, information is not displayed.
- ISDN

ISDN notification of an MCT activation takes place if either the originator of the call is an ISDN trunk group with Country Protocol 2 or any trunk on the call is an ISDN private network trunk with Country Protocol 1 and Protocol Version "a" or Peer Protocol q-sig. When the ISDN trunk group is Country Protocol 2, notification is sent only to the public network.
- Make-Busy/Position-Busy/Send All Calls

The switch attempts to activate Make-Busy or Position-Busy for stations or consoles that activate MCT-Control. If a user has a Send All Calls (SAC) button administered, then SAC activates when the user activates MCT-Control. When MCT is deactivated, the station resets to its original state.
- Music-On-Hold

## 4 Basic Features

### *Malicious Call Trace*

Page 4-428

If an agent places a malicious call on hold that is being recorded and the call goes to music-on-hold, the music-on-hold port and the MCT Voice Recorder port can lock. In this case, the MCT Voice Recorder continues to record the music-on-hold and is unavailable for recording subsequent malicious calls. You must perform a busy-out/release on the MCT Voice Recorder port to drop the connection.

- Priority Calling

A priority call to an MCT recipient is denied.

- QSIG Global Networking

MCT notification passes over the following ISDN QSIG trunk groups: tandem, tie, access, and DMI-BOS. QSIG supplementary services name and number ID provide a malicious caller's name and telephone number.

- R2 Multi-Frequency Code

MCT does not use R2 Multi-Frequency Code (MFC) signaling.

- Transfer

If a user transfers a malicious call, the MCT information displayed on the controlling terminal identifies the transferring party as the MCT recipient.

A user transfers a malicious caller to hold. The user initiates a Transfer, receives the second dial tone, enters the MCT-Activate FAC, then halts the remainder of the Transfer operation and returns to the malicious caller's appearance.

- Trunk Access Code

To activate MCT for a Trunk Access Code (TAC), a user must have an MCT-Control button administered. The user hears a dial tone and enters the trunk-member number for the trunk group that the TAC identified. The user then becomes the MCT controller for a call involving the identified trunk member. This TAC operation is useful when users need to trace a call that has tandemed through their switch to terminate on another switch.

- Trunk Groups

If a Personal Central Office Line (PCOL) is involved in an MCT, then the switch may hold up the trunk until the MCT deactivates.

## Manual Message Waiting

---

Manual Message Waiting enables multiappearance voice-terminal users to press a designated button on their own terminals and light the Manual Message Waiting button lamp at another multiappearance voice terminal.

### How to administer Manual Message Waiting

---

#### Required Forms

---

| Form                      | Field   | Page                 |
|---------------------------|---|----------------------|
| Station (multiappearance) | ■ Button/Feature Button Assignments<br>— man-msg-wt | <a href="#">6-14</a> |

---

### Detailed description

---

Press the Manual Message Waiting button to light the lamp on both the originating and receiving voice-terminals. Either terminal user can cause the lamp to go dark by pressing the button.

### Considerations

---

This feature can be administered only to pairs of voice terminals such as a secretary and an executive. The secretary might press the designated button to signal the executive that a call needs answering. The executive might press the button to indicate `Do Not Disturb` or `Not Available` to the secretary. (The button can be marked to reflect the intended use.)

### Interactions

---

None.

## Manual Originating Line Service

---

Manual Originating Line Service connects single-line voice-terminal users to the attendant automatically when a user lifts the handset.

### How to administer Manual Originating Line Service

---

#### Required Forms

---

| Form                     | Field                                 | Page                 |
|--------------------------|---------------------------------------|----------------------|
| Abbreviated Dialing List | ■ Dial Code (attendant)               |                      |
| — System List            |                                       | <a href="#">5-11</a> |
| — Group List             |                                       | <a href="#">5-5</a>  |
| — Personal List          |                                       | <a href="#">5-8</a>  |
| Station (single-line)    | ■ Abbreviated Dialing List 1, 2, or 3 | <a href="#">6-28</a> |
|                          | ■ Hot Line Destination AD List        |                      |

---

#### Detailed description

---

When a voice-terminal user lifts the handset, the system automatically routes the call to the attendant using Hot Line Service. The attendant code is stored in an Abbreviated Dialing List.

#### Considerations

---

- Use Manual Originating Line Service when all call originations are screened by the attendant. The user lifts the handset and is connected to the attendant.
- Call reception is not affected. A user can receive calls allowed by the assigned Class of Restriction (COR).
- Assign Manual Originating Line Service to any number of single-line voice terminals.

## Interactions

---

- Hotline Service

A Manual Originating Line Service call is a hotline service call to the attendant. A voice-terminal user cannot activate features that require dialing.

- Night Service

When Night Service is activated, the Manual Originating Line Service call is redirected.

## Manual Signaling

---

Manual Signaling allows voice-terminal users to signal other voice-terminal users. When a voice-terminal user presses the Manual Signaling button:

- The status lamp at the originating voice terminal lights for 2 seconds.
- The receiving voice-terminal user hears a 2-second burst of tone.

Manual Signaling is denied if the receiving voice terminal is already being alerted with an incoming call. The Manual Signaling button lamp at the originating voice terminal flutters briefly to indicate the denial.

### NOTE:

A Manual Signaling button cannot point to a Vector Directory Number.

## How to administer Manual Signaling

---

### Required forms

---

| Form                      | Field  | Page                 |
|---------------------------|--|----------------------|
| Station (multiappearance) | ■ Button/Feature Button Assignments<br>— signal (Ext: ___) | <a href="#">6-14</a> |

---

## Considerations

---

- The sender and the receiver should agree on the meaning of the signal.

## Interactions

---

- Data Modules

If you administer a Manual Signaling button with a data module's extension, attempts to activate the button result in denial.

## Messaging Server Interface

---

*This product is not supported as part of Lucent's service support agreements for DEFINITY ECS R6 and later.* Messaging Server (MS) interface provides MS-based features to the system such as Directory Service, Message Center Service, and Unified Messaging Services such as Electronic Documentation Communications, UNIX system mail, Office Telesystem, and DCS Centralized Messaging.

The MS interface consists of a control link between the DEFINITY and the MS and includes a hunt group of MS agents that takes messages. The control link transmits extra information relevant to each MS agent-handled call for the following services:

- Message Center Service — When agents receive (or drop) calls to leave or retrieve messages.
- Leave Word Calling — When users leave simple messages to call back or retrieves these call-back messages without MS agent intervention.
- Automatic Message Waiting lamp — When users manipulate message waiting lamps on stations.
- Clock Synchronization — Used to ensure that the MS clock is synchronized with the DEFINITYECS clock.

### How to administer MS interface

---

How you administer the MS interface depends on which type of DEFINITY you have.

**Table 4-82. Required forms for R5r only**

**Detailed description**

[Figure 4-4](#) shows an MS interface to the system. You can provide SCI link connectivity (control path) via either an MPDM (distance between the system and Messaging Server less than 5000 feet or 1500 meters) or LADs and an associated MTDM (distance greater than 5000 feet or 1500 meters). The EIA connectivity (data path) can be implemented via one of the three options shown.

\* PC EQUIPPED WITH 3B2 MS STATION SOFTWARE.  
 SEE PC/PBX CONNECTIONS FOR ASSOCIATED  
 IMPLEMENTATION INSTRUCTIONS

† SCI LINK CONNECTIVITY (CONTROL PATH)  
 FOR DISTANCES GREATER THAN 5000 FEET,  
 USE LADS AND MTDM CONNECTION.

‡ EIA CONNECTIVITY (DATA PATHS)

Figure 4-4. Typical Messaging Server Interface Connections

## **Considerations**

---

- You must set a coverage point on the Coverage Path form to include the hunt group number of the MS agent hunt group.

## **Interactions**

---

None.

## Multifrequency Signaling

Multifrequency (MF) signaling is a form of address signaling used between switches and the central office (CO). It is similar to dual-tone multifrequency (DTMF) signaling in that tones convey the dialed number.

With MF signaling, the signal is typically a combination of two frequencies from a group of 5 or 6 frequencies (2/5 or 2/6). The origination switch and destination switch exchange tones that have specific meanings according to the MF protocol.

### How to administer MF Signaling

#### Required forms

| Form   | Field  | Page                  |
|--|--|-----------------------|
| Multifrequency-Signaling-Related System-Parameters | ■ All  | <a href="#">5-228</a> |
| Trunk Group  |  | <a href="#">7-115</a> |
| — CO   | ■ Outgoing Dial Type                         | <a href="#">7-168</a> |
| — DID  | ■ Incoming Dial Type                         | <a href="#">7-178</a> |
| — DIOD   | ■ Outgoing Dial Type                         | <a href="#">7-183</a> |
| — Tie  | ■ Incoming Dial Type<br>■ Outgoing Dial Type | <a href="#">7-262</a> |
| AAR and ARS Digit Analysis Table                   | ■ ANI  | <a href="#">8-55</a>  |
| AAR and ARS Digit Conversion Table                 | ■ ANI  | <a href="#">8-63</a>  |
| Class of Restriction                               | ■ Category for MFC ANI                       | <a href="#">5-72</a>  |
| System-Parameters Customer-Options                 | ■ G3 Version<br>■ Multifrequency Signaling   | <a href="#">5-228</a> |

To receive Russian incoming ANI:

- On the DID or DIOD trunk group form, set `Country` to **15** and `Protocol Type` to **inloc**.
- On AAR and ARS Digit Analysis Table, set `ANI Req` field to **y** or on AAR and ARS Digit Conversion Table, set `ANI Req` field to **y**.

## Detailed description

---

DEFINITY ECS supports two frequency groups:

- R2-multifrequency compelled signaling (R2-MFC) frequency
- R1 frequency (for Spain and Russia)

R2-MFC is a version of MFC recommended by the Consultative Committee for International Telephone and Telegraph (CCITT). It provides signaling between a CO and a switch over analog or digital CO, DID, or DIOD trunks. It also provides signaling between 2 DEFINITY switches.

DEFINITY ECS provides MF signaling that complies with CCITT regulations and national regulations for specific countries. It provides these types of MF signaling: Multifrequency Espana (MFE), MF Shuttle, and multifrequency compelled (R2-MFC). These protocols signal the called number, the calling party's number (automatic number identification (ANI)), and information about the type of call or type of caller (category).

DEFINITY ECS allows prefix digits for ANI sent on outgoing calls to be defined per PBX or per the originator's class of restriction.

If a call is a tandem call and the incoming and outgoing trunk use different protocols, the switch makes no attempt to convert between the various protocol's meanings for category. Instead,

- the PBX uses the incoming trunk's COR assigned category if the outgoing trunk is Russian or R2-MFC, and
- the PBX uses ARS call types if the outgoing trunk is MFE.

DEFINITY ECS provides the incoming ANI to all features on the switch that need to identify the calling party.

## MFE

MFE, for Country code 11 (Spain), uses R1 frequency and compelled signaling. It is available on CO and DID trunk groups. There are four kinds of MFE signaling:

- Public 2/5
- Public 2/6
- Ibercom 2/5
- Ibercom 2/6

## MF Shuttle

MF shuttle signaling, for country code 15 (Russia), uses R1 frequency and noncompelled signaling. With MF shuttle signaling, it is possible to change to decadic rotary pulse in the middle of address signal exchange. MF shuttle signaling is available on CO, DID, and DIOD trunk groups.

## 4 Basic Features

### Multifrequency Signaling

Page 4-440

Also, automatic number identification (ANI) transmission, for Country code 15, uses a gapless R1 MF signal and is completed within 800ms. This is available on an outgoing CO trunk group.

## R2-MFC

R2-MFC, with DEFINITY ECS, permits each country to define the meanings of the R2 frequency combinations. Specific frequency combinations for different countries are described in the *DEFINITY ECS Application Notes for Type Approval*.

## R2-MFC Considerations

- Both non-group II signaling and group II signaling are supported on incoming MF signaling calls. The group II signaling protocol has an extra signal that provides caller-category information. Only group II signaling is supported on outgoing MF signaling calls.
- MF signaling also can be used in tandem trunk groups. After address signals are collected from an incoming group II MF signaling call, the call can route to a group II MF signaling trunk.
- Both incoming and outgoing MF signaling calls support ANI. The terminal displays ANI information and the Call Detail Recording (CDR) record records it.
- When DEFINITY ECS uses an open numbering plan, the end-of-dial signal must be defined in the incoming Group I signal administration. After sending all address digits, the CO sends the end-of-dial signal to DEFINITY ECS.
- If DEFINITY ECS makes an outgoing call to the CO that uses an open numbering plan, the CO should send the signal A.1 to DEFINITY ECS after sending the last address digit to the CO. Then, the CO should timeout and send a pulsed signal A.3 to DEFINITY ECS requesting the Group II signal.

## Guidelines for administering MF signaling

To administer MF signaling, first you identify the origination switch and the destination switch. (The switch making the call is the origination switch; the switch answering the call is the destination switch.)

- The origination switch creates *forward* signals, classified as group I and group II signals.
- The destination switch creates *backward* signals, classified as group A and group B signals.

Group I and group A signals comprise the basic signaling for the dialed number. More elaborate signaling requires Group II and group B signals. Signal meanings and timer values can be administered.

The sequence below shows a typical interaction between the origination (forward group I and group II signals) and destination switch (backward group A and group B signals).

| Forward  |           | Backward    |
|----------|-----------|-------------|
| Group I  | digit --> |             |
|          | <-- A.1   | Group A     |
|          | digit --> |             |
|          | <-- A.1   |             |
|          | digit --> |             |
|          | <-- A.1   |             |
|          | digit --> |             |
|          | <-- A.1   |             |
|          | digit --> |             |
|          | <-- A.3   | End of dial |
| Group II | II.2 -->  |             |
|          | <-- B.x   | Group B     |

Second, you assign the correlation between signal codes and their meanings.

1. Assign a code to every message. The code consists of a group category, like group II or A, and a number.
  - For example, you might assign code A.1 to the message “next-digit.”
2. Assign a signal to each identifying code.
  - In every country, the frequencies (levels may differ by country) assigned to the identifying codes are the same. However, the messages assigned to the identifying codes may be different.

For example, in Switzerland the B.6 code and its associated signal convey the *free* message, while in Thailand, *free* is conveyed by the B.1 code and its associated signal. But in both Switzerland and Thailand, the frequency associated with the B.1 code is the same.

As another example, you might assign the signal “busy” to the B.1 code.

## Interactions

---

- ASAI
  - ANI collected from incoming R2-MFC signaling can be used with ASAI.

## 4 Basic Features

### Multifrequency Signaling

Page 4-442

- Abbreviated Dialing

Although calls dialed automatically from an abbreviated dialing privileged list complete without class of restriction (COR) checking, ANI prefix and ANI truncation still apply.

- Attendant Console

If the attendant assists or extends a call for a station via Straightforward Outward Completion and Through Dialing, and if the attendant has not yet released the call when the request for ANI comes in from the far end, the attendant's COR is used to select the ANI for the call. If the attendant has already released the call when the request for ANI comes in from the far end, the attendant's COR is used to select the ANI for the call.

- Authorization Codes

The COR of the authorization code as administered on the authorization-code form is not used for ANI prefix determination, even if the originating endpoint enters an authorization code before call processing for an outgoing call seizes an outgoing trunk. If the originating endpoint is an extension, the extension's ANI is used. If the originating endpoint is an incoming trunk, the ANI for PBX is used.

- Bridging

The ANI of a voice terminal's primary extension also applies to calls originated from a bridged call appearance of that extension on another terminal. ANI prefix and ANI truncation will still apply to the primary extension number of bridged call appearances.

- Call Detail Recording

CDR records ANI collected from incoming MF signaling.

**For India** MFC, on incoming calls, ANI digits may be appended with zeroes if the actual ANI digits are less than the administered ANI-length; in those cases, the zero-digits appear on CDR.

- Call Redirection

A call is redirected if any of the following are active: Call Forwarding, Call Coverage, Send All Calls, or Night Service.

- Call Vectoring

Call Vectoring can now use ANI collected from incoming MFC signaling.

The ANI of a call vector is not used when a call vectoring route-to-command routes a call over an outgoing trunk. Instead, the ANI of the originating party is sent.

- DID No Answer Timer

DID No Answer Timer is applied to MF signaling DID calls.

- Distributed Communications System (DCS)

In a DCS arrangement, as shown below,

**4 Basic Features**

*Multifrequency Signaling*

set ----- PBX\_A -----PBX\_B ----- CO  
DCS trunk                      MF trunk

the ANI sent to the CO is determined by the ANI for PBX on PBX\_B, but the category sent to the CO is determined by the *Category for MF ANI* field on the Class of Restriction form for the incoming DCS trunk or by the type of call.

- **Expert Agent Select (EAS)**

For ANI, the EAS agent’s login extension number and COR overrides the extension number and COR of the physical terminal where the agent is logged in. ANI prefix and ANI truncation apply to logged in EAS agents.
- **Hunt Groups and Automatic Call Distribution (ACD) Splits**

For ANI, a physical terminal’s extension number and COR overrides the extension number and COR of the hunt group or ACD split that the terminal is a member of or logged into. ANI prefix and ANI truncation apply to terminals that are members of hunt groups or logged into ACD splits.
- **Multimedia Call Handling (MMCH)**

For call origination, multimedia complexes use the COR assigned to their voice terminals. ANI prefix and ANI truncation will apply to the voice terminals assigned to multimedia complexes.
- **Off-Net Call Coverage or Call Forwarding**

If the originating endpoint is an extension, the extension’s ANI is used. If the originating endpoint is an incoming trunk that can supply ANI, the ANI received from the incoming trunk is used. If the originating endpoint is neither of the above, the ANI for PBX is used.
- **Personal Station Access (PSA)**

For ANI, the PSA extension number and COR overrides the extension number and COR of the physical terminal where the PSA extension number is associated. ANI prefix and ANI truncation will apply to associated PSA extension numbers.
- **Remote Access**

The COR of a remote access barrier code is not used for ANI prefix determination when the originating end point dials a remote access extension and then places a call. If the originating endpoint is an extension, the extension’s ANI is used. If the originating endpoint is an incoming trunk, the ANI for PBX is used.

## 4 Basic Features

### Multifrequency Signaling

Page 4-444

- Station Set Displays

When no ANI is possible, if station sets are equipped with display option, they do not display the ANI digits. Instead, the trunk group name displays. When ANI is possible, ANI displays on the station set.

**For India Only.** If ANI digits are padded with “zero,” then zeroes also are displayed along with ANI digits.

- Tandem / Offnet Calls

If ANI digits are received on incoming MFC calls, the ANI digits are sent to outgoing tandem/off-net calls.

**For Russia Only.** The ANI is requested on incoming trunks only when all the address digits have been collected. When the incoming trunk on a tandem call is a Russian incoming local trunk administered to collect ANI, the PBX collects all ANI digits before seizing the outgoing tandem trunk. This happens even if ARS is administered with a “min” value low enough that it would be possible to determine an outgoing route through digit analysis.

**For India Only.** On an outgoing tandem-call, the default operation is to send the ANI-Not-Available forward signal if ANI is not available from the incoming trunk. However, in order to support this operation, leave the `ANI for PBX` field blank, and define the ANI-Not-Available signal.

## Misoperation Handling

---

Misoperation Handling, used only in France and Italy, defines how calls are handled when a misoperation occurs. A misoperation can occur either:

- When a user with a call on hold goes on-hook before an operation completes. In some cases, going on-hook completes the operation, as in call transfer.
- When the system enters Night Service while attendant consoles have calls on hold.

You can alter standard Misoperation Handling to ensure that callers are not left on hold indefinitely with no way to reach someone for assistance or that callers are not dropped by the system.

### How to administer Misoperation Handling

---

Contact a Lucent representative for instructions on administering Misoperation Handling for use in France.

#### Required forms

| Form                                 | Field   | Page                  |
|--------------------------------------|---|-----------------------|
| Feature-Related<br>System Parameters | ■ Misoperation Alerting                         | <a href="#">5-123</a> |
|                                      | ■ Intercept Treatment on Failed Trunk Transfers |                       |

### Detailed description

---

Misoperation handling varies considerably, depending on how it is administered and what conditions are in effect when a call is placed on hold.

### Standard operation

Standard misoperation handling is in effect when you set the `Intercept Treatment on Failed Trunk Transfers` field to **y** and set `Misoperation Alerting` to **n**.

The type of voice terminal that is in use when the misoperation occurs (analog single-line or digital multiappearance) affects standard misoperation handling.

The following scenario describes a typical misoperation on an analog terminal.

1. While connected to an incoming external call, an analog-terminal user flashes with the intent of transferring the call to another terminal.
2. The user hears dial tone, dials an invalid extension, and hangs up.

3. A misoperation occurs. The analog-terminal user receives priority ringback indefinitely.

The following scenario describes a typical misoperation on a digital terminal.

1. While connected to an incoming external call, a digital-terminal user with a call on hold goes on-hook during another feature operation before completing the operation.
2. The user hears dial tone, dials an invalid extension, and hangs up.
3. A misoperation occurs unless going on-hook completes the operation (for example, call transfer). The held call remains on hold indefinitely with a flashing call-appearance lamp.

## Enhanced operation

Once you enable Misoperation Alerting, calls are handled depending upon the type of call placed on hold and the type of voice terminal (digital multiappearance, analog single-line, or attendant console) in use when the misoperation occurs. The following list describes the 3 call types that determine misoperation handling.

- Call Type 1 — An outgoing public-network call is classified as Type 1 when answer supervision is received or when the trunk group's Answer Supervision Timer expires, even if the trunk is still ringing. An incoming call is classified as Type 1 when it is answered.
- Call Type 2 — An incoming external-public-network call is classified as Type 2 before it is answered. A misoperation cannot occur with a Type 2 call because an unanswered incoming call cannot be placed on hold without first being answered.
- Call Type 3 — All internal calls, conference calls, and tie-trunk calls are classified as Type 3.

## Analog terminal misoperation

The following 2 scenarios describe typical misoperations on an analog terminal.

### Scenario 1.

1. While connected to an incoming external call (Type 1), an analog-terminal user flashes to transfer the call to another terminal.
2. The user hears dial tone, dials an invalid extension, then hears intercept tone.
3. When the user hangs up, the call re-alerts the user for 15 seconds and eventually routes to the attendant.

### Scenario 2.

1. While connected to an incoming external call (Type 1), an analog station user flashes to place the call on hold while calling another extension.
2. The user hears dial tone and dials the CAS Remote Hold/Answer Hold/unhold access code.
3. The user dials an extension and talks with the user at the extension and hangs up.
4. A misoperation occurs because the first call is still left on hold.
5. The terminal is alerted for 15 seconds and the call routes to an attendant.
6. If the first call is not answered before the timer expires, the call drops.

### Digital terminal misoperation

The following scenario describes a typical misoperation on a digital terminal.

1. While connected to an incoming external call (Type 1), a digital-terminal user places the call on hold to transfer the call to another terminal.
2. The user hears dial tone, dials an invalid extension, and hangs up.
3. A misoperation occurs. The call on hold rerings the terminal (not priority ringing) for the number of rings administered for call coverage.
4. The call then routes to the terminal's coverage path, which directs the call to an announcement and/or disconnects.

### Attendant console misoperation

A misoperation occurs on an attendant console with calls on hold only when the system enters Night Service.

1. The system enters Night Service with calls on hold at an attendant console.
2. All calls on hold re-alert (as if the Held-Call Timed-Reminder had expired).
3. When the calls start re-alerting, a timer starts. The timer is set to the value assigned in the `Alerting (sec)` field on the Console-Parameters form.
4. If the attendant does not answer the calls before the timer expires, calls route to the system Night Service destination. Calls that are not answered at the night service destination before the night-service-disconnect timer expires are dropped.

## Interactions

---

- Attendant Lockout  
Attendant Lockout is temporarily disabled on calls that re-alert the attendant console following a misoperation. This allows an attendant to answer the calls.
- Bridged Appearances  
Misoperation Alerting calls do not re-alert on bridged call appearances.
- Voice Response Integration  
Do not use Misoperations Handling with this feature if you are using analog boards with Conversant.

## Modem Pooling

Modem Pooling allows switched connections between digital-data endpoints (data modules) and analog-data endpoints via pods of acoustic-coupled modems. The analog-data endpoint is either a trunk or a line circuit.

### How to administer Modem Pooling

#### Required forms for Integrated Modem Pooling

| Form                      | Field                          | Page                  |
|---------------------------|--------------------------------|-----------------------|
| Modem Pool Group          | ■ All                          | <a href="#">5-223</a> |
| Feature Access Code (FAC) | ■ Data Origination Access Code | <a href="#">5-113</a> |
| Data Module (all)         | ■ All                          | <a href="#">6-226</a> |

#### Required forms for Combined Modem Pooling

| Form                      | Field                          | Page                  |
|---------------------------|--------------------------------|-----------------------|
| Modem Pool Group          | ■ All                          | <a href="#">5-223</a> |
| Feature Access Code (FAC) | ■ Data Origination Access Code | <a href="#">5-113</a> |

### Detailed description

Data transmission between a digital data endpoint and an analog endpoint requires conversion via a modem, because the DCP format used by the data module is not compatible with the modulated signals of an analog modem. A modem translates DCP format into modulated signals and vice versa.

Modem Pooling feature provides pools of integrated-conversion modems and combined-conversion modems.

Integrated-conversion modem pools have functionality integrated on the TN758 Pooled Modem circuit pack, providing two modems. Each one emulates a TDM cabled to a 212 modem. Integrated are modem pools not available in countries that use A-law companding.

Combined-conversion modem pools are TDMs cabled to any TDM-compatible modem. Combined-conversion modem pools can be used with all systems.

When the system needs a modem, it queries the digital-data module associated with the call to determine if the module's options are compatible with those supported by the modem pools. If the options are not compatible, the originating user receives intercept treatment. If the options are compatible, the system

obtains a modem from the appropriate pool. If a modem is not available, the user receives reorder treatment.

The system can detect the needs for a modem. Data calls from an analog-data endpoint require that the user indicate the need for a modem, because the system considers such calls to be voice calls. Users indicate this need by dialing the data-origination access code before dialing the digital-data endpoint.

The system provides a Hold Time parameter to specify the maximum time any modem can be held but not used (while a data call is in queue).

The integrated-conversion modems support the following options:

- Receiver responds to remote loop
- Loss of carrier disconnect
- Send space disconnect
- Receive space disconnect
- CF-CB common
- Speed, duplex, and synch (administered)

Combined-conversion modems support the following:

- IBM bisynchronous protocols typically used in 3270 and 2780/3780 applications. Both require 2400 or 4800 bps, half-duplex, synchronous transmission.
- Interactive IBM-TSO applications using 1200 bps, half-duplex, asynchronous transmissions
- DATAPHONE II switched-network modems supporting asynchronous and synchronous communications, and autobaud at 300, 1200, or 2400 bps
- The DEFINITY ECS operating at up to 19.2 kbps
- Different pools with different data-transmission characteristics

## Considerations

- On data calls between a data module and an analog-data endpoint, Return-to-Voice releases the modem and returns it to the pool. The voice-terminal user connects to the analog-data endpoint.
- For traffic purposes, the system accumulates data on modem-pooling calls separate from voice calls. Measurements on the pools also accumulate.
- When a voice-terminal user places a data call to a digital-data endpoint, does not transfer the call to another digital-data endpoint, and uses a modem or acoustically-coupled modem, the user dials the data-origination access code before dialing the distant endpoint.

- Modem Pooling is not restricted. Queuing for modems is not provided, although calls queued on a hunt group retain reserved modems.
- Avoid mixing modems from different vendors within a combined pool because such modems may differ in transmission characteristics.
- When you administer data-transmission characteristics (speed, duplex, and synchronization mode), they must be identical to the TDM and optional modem selections made by the customer.
- Each data call that uses Modem Pooling uses four time slots (not just two). As a result, heavy usage of Modem Pooling could affect TDM bus-blocking characteristics.
- Tandem switches do not insert a pooled modem. The originating switch inserts a pooled modem.

## Interactions

---

- Call Detail Recording  
Data call CDR records the use of modem pools on trunk calls.
- Data Call Setup  
Data calls to or from a TDM cannot use Modem Pooling.
- Data Privacy and Data Restriction  
The insertion of a modem pool does not turn off Data Privacy or Data Restriction.
- Data-Only Off-Premises Extensions  
Calls to or from a Data-Only Off-Premises Extension cannot use Modem Pooling, when this type of digital-data endpoint uses a TDM.
- DMI Trunks  
If you place a data call from a local analog-data endpoint to a DMI trunk, you must dial the data-origination access code to obtain a modem. Data calls on DMI trunks to local analog-data endpoints automatically obtain modems.
- DS1 Tie Trunk Service  
Connect modems used for Modem Pooling to AVD DS1 tie trunks via Data Terminal Dialing or by dialing the feature-access code for data origination.

## Multiappearance Preselection and Preference

---

Multiappearance Preselection and Preference selects the call appearances you use to connect to when you lift the handset.

### How to administer Multiappearance Preselection and Preference

---

You do not have to administer Preselection.

#### Required forms

---

| Form                      | Field                         | Page                 |
|---------------------------|-------------------------------|----------------------|
| Station (multiappearance) | ■ Idle Appearance Preference  | <a href="#">6-14</a> |
|                           | ■ Select Last Used Appearance |                      |

---

### Detailed description

---

Multiappearance Preselection and Preference provides multiappearance voice-terminal users with the following options for placing or answering calls on selected call appearances.

- Ringing Appearance Preference

When a user lifts the handset to answer a call, the system automatically connects them to the ringing call appearance. If there is more than one call, the user automatically connects to the oldest (first-in) ringing call appearance. The in-use (red) lamp tracks the ringing appearance and the answered appearance.

- Idle Appearance Preference

When a user lifts the handset to place a call, the system automatically connects them to an idle appearance even if an incoming call is ringing at another appearance. The in-use (red) lamp tracks an idle appearance when the user lifts the handset.

- Last Appearance Preference

When a user lifts the handset, they connect to the call appearance or bridged appearance last used for a call, unless an audibly ringing call on a different appearance caused the line selection to move. If the line selection moves, a call may be originated, answered, or unheld, depending on the state of that appearance.

- Preselection

Before lifting the handset to place or answer a call, the user can press a call appearance button or a feature button to select an appearance when the in-use lamp is dark. Preselection reenters a held call or activates a feature or the speakerphone if the voice terminal is so equipped.

Preselection overrides both Preference options. If the user does not lift the handset within 5 seconds after using Preselection, the selected appearance returns to idle.

You can assign a preselection feature button. For example, if a user presses an Abbreviated Dialing button, a call appearance is automatically selected. If the user lifts the handset within 5 seconds, the system automatically places the call.

Preference dictates whether a user connects to the ringing call appearance or to an idle call appearance. If there is no call, users automatically connect to an idle call appearance when they lift the handset, regardless of which Preference option is assigned.

## Considerations

---

- Multiappearance voice terminals can have from 2 to 10 call appearances. One of these call appearances is reserved for placing calls or for receiving a Priority Calling call. If a voice terminal has 2 call appearances and one of them is active, a nonpriority call cannot access the other call appearance, even if the call appearance is idle. The default number of call appearances is 3.
- The reserved call appearance is not a fixed-position button; it is just the last-idle call appearance. For example, if a voice terminal has 10 call appearances, any 9 can be in use, but the tenth (last) is reserved.
- All incoming and outgoing calls require a call appearance. There are no hidden or free call appearances. For example, when a call rings a call-pickup group member, another member normally presses the Call Pickup button to answer the call. However, pressing the button only selects a call appearance for the call, if available. If a call appearance is not available, the call cannot be picked up.
- Similarly, calls placed by using Facility Busy Indication also require a call appearance. In this case, the call cannot complete unless an idle call appearance is available. A Facility Busy Indication button on the called voice terminal provides a visual indication of the busy or idle status of another facility, but it does not provide a talking path.

## Interactions

---

- Automatic Incoming Call Display  
Incoming calls are not displayed if Idle Appearance Preference is activated.
- Call Coverage  
If you administer Cover All Calls as the redirection criterion for a voice terminal, administer Idle Appearance Preference for the terminal. The called party can then lift the handset without accidentally connecting to a call that should be screened.
- Integrated Services Digital Network — Basic Rate Interface  
When an ISDN-BRI terminal (with Select Last Used Appearance enabled) transfers a call while off-hook by using the handset, the user hears dial tone on the last-used call appearance. Users of other voice-terminal types hear silence in this case.

## Music-on-Hold Access

Music-on-Hold Access automatically provides music, silence, or tone to a caller. Providing music lets the caller know that the connection is still active. The following table shows what happens when you administer one of the options.

| Caller Status                             | Music | Silence | Tone |
|---|-------|---------|------|
| On hold                                   | yes   | no      | yes  |
| On a trunk call that is being transferred | yes   | yes     | no   |
| Parked                                    | yes   | no      | yes  |
| Waiting in queue                          | yes   | no      | yes  |

### ⇒ NOTE:

If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from or pay fees to a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI).

## How to administer Music-on-Hold Access

### Required forms

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Feature-Related System Parameters | ■ Music/Tone On Hold                            | <a href="#">5-123</a> |
|                                   | ■ Music Port                                    |                       |
|                                   | ■ Music (or Silence) on Transferred Trunk Calls |                       |
| Music Sources                     | ■ All   | <a href="#">5-243</a> |
| CPE trunk group                   | ■ All   | <a href="#">7-174</a> |
| Class of Restriction              | ■ Hear System Music on Hold                     | <a href="#">5-72</a>  |

## Consideration

- If the `Tenant Partitioning` field on the System-Parameters Customer-Options form is set to **y**, you *cannot* administer Music/Tone on Hold on the Feature-Related System Parameters form; you must use the Music Sources form.
- Any number of calls can simultaneously connect to music.
- The system does not provide music to callers in a multiple-party connection who are in queue, on hold, or parked.

## Interactions

---

- Automatic Call Distribution

If you administer `Music/Tone on Hold` to provide music, the system provides the music after the ACD split delayed announcement.

- Data Privacy and Data Restriction

If a call with either Data Privacy or Data Restriction activated is placed on hold, `Music/Tone on Hold` access is withheld to prevent transmission of a musical tone that a connected data service might falsely interpret as a data transmission.

- Hunting

If you administer `Music/Tone on Hold` to provide music, the system provides the music after the DDC group or UCD group delayed announcement.

## Night Service

---

DEFINITY ECS provides the following Night Service features:

- Hunt Group Night Service
- Night Console Service
- Night Station Service
- Trunk Answer from Any Station
- Trunk Group Night Service

### Hunt Group Night Service

---

Hunt Group Night Service allows an attendant or a split supervisor to assign a hunt group or split to Night Service mode. All calls for the hunt group then are redirected to the hunt group's designated Night Service extension (NSE). When a user activates Hunt Group Night Service, the associated button lamp lights.

### How to administer Hunt Group Night Service

#### Required forms

| Form                         | Field  | Page                  |
|------------------------------|--|-----------------------|
| Station<br>(multiappearance) | ■ Button/Feature Button Assignments<br>— hunt-ns | <a href="#">6-14</a>  |
| Attendant Console            | ■ Feature Button Assignments<br>— hunt-ns        | <a href="#">5-35</a>  |
| Hunt Group                   | ■ Night Service Destination                      | <a href="#">5-158</a> |

### Night Console Service

---

Night Console Service directs all calls for primary and daytime attendant consoles to a night console. When a user activates Night Console Service, the Night Service button for each attendant lights and all attendant-seeking calls (and calls waiting) in the queue are directed to the night console.

To activate and deactivate this feature, the attendant typically presses the Night button on the principal attendant console or designated console.

## How to administer Night Console Service

### Required forms

| Form              | Field          | Page                 |
|-------------------|----------------|----------------------|
| Attendant Console | ■ Console Type | <a href="#">5-35</a> |

## Night Station Service

Night Station Service directs incoming calls for the attendant to designated extensions. Attendants can activate Night Station Service by pressing the Night button on the principle console if there is not an active night console. If the night station is busy, calls (including emergency attendant calls) receive busy tone. They do not queue for the attendant.

When Night Station Service is active, incoming calls to the attendant route as follows:

- DID Listed Directory Number (LDN) calls route to a designated DID-LDN night extension.
- Internal calls route to the DID-LDN night extension (unless you administer the system so only DID-LDN calls can route to the LDN night extension).
- Non-DID calls route to the night destination that you specify for the trunk group or for the individual trunk. If you do not specify a night destination, the calls route to the DID-LDN night extension.

You can assign a unique extension as the night destination for each incoming central-office, foreign-exchange, or 800-Service trunk group. Both the extension assigned as a trunk group's night destination and the DID-LDN night extension can be voice terminals or answering groups (such as DDC group, UCD group, or TEG).

## How to administer Night Station Service

### Required forms

| Form                     | Field                       | Page                  |
|--------------------------|-----------------------------|-----------------------|
| Listed Directory Numbers | ■ Night Destination         | <a href="#">5-207</a> |
| Trunk Groups (All)       | ■ Night Service             | <a href="#">7-115</a> |
| Hunt Group               | ■ Night Service Destination | <a href="#">5-158</a> |

*Continued on next page*

**Required forms — Continued**

| Form                      | Field   | Page                 |
|---------------------------|---|----------------------|
| Attendant Console         | <ul style="list-style-type: none"> <li>■ Feature Button Assignments                             <ul style="list-style-type: none"> <li>— hunt-ns</li> <li>— night-ser</li> <li>— trunk-ns</li> </ul> </li> </ul>        | <a href="#">5-35</a> |
| Station (multiappearance) | <ul style="list-style-type: none"> <li>■ Button/Feature Button Assignments                             <ul style="list-style-type: none"> <li>— night-ser</li> <li>— hunt-ns</li> <li>— trunk-ns</li> </ul> </li> </ul> | <a href="#">6-14</a> |

**Trunk Answer from Any Station**

Trunk Answer from Any Station (TAAS) allows voice-terminal users to answer all incoming calls to the attendant when the attendant is not on duty and when other voice terminals have not been designated to answer the calls. The incoming call activates a gong, bell, or chime and a voice-terminal user dials an access code to answer the call.

Users can activate TAAS if each of the following conditions is met:

- The attendant has pressed the Night button on the primary console or a user (if the switch has no attendant) pressed the Night Service button on the designated Night Service voice terminal.
- A night console is not assigned or is not operational.
- Night Station Service is not active.

**How to administer TAAS**

**Required forms**

| Form                      | Field  | Page                  |
|---------------------------|--|-----------------------|
| Trunk Groups (All)        | <ul style="list-style-type: none"> <li>■ Night Service (blank)</li> </ul>                | <a href="#">7-115</a> |
| Feature Access Code (FAC) | <ul style="list-style-type: none"> <li>■ Trunk Answer Any Station Access Code</li> </ul> | <a href="#">5-113</a> |
| Console-Parameters        | <ul style="list-style-type: none"> <li>■ Ext Alert Port (TAAS)</li> </ul>                | <a href="#">5-86</a>  |

## Trunk Group Night Service

Trunk Group Night Service allows an attendant or a designated Night Service voice-terminal user to assign one or all trunk groups to Night Service mode. When a user activates Night Service, trunk groups that are assigned a Trunk Group Night Service termination change to Individual Trunk Night Service mode so that calls coming into the trunk group are redirected to the group's designated Night Service extension (NSE). Incoming calls on trunk groups that are not assigned to Trunk Group Night Service are queued in the attendant queue. If the call remains unanswered during the Night Service Disconnect Timer interval, the incoming trunk disconnects.

In addition, a user can assign all the trunk groups to the night service mode at the same time. Then all the trunk groups are in the System Night Service mode. Any incoming calls made on the trunk groups are redirected to their designated NSE. To assign all the trunk groups to System Night Service, the user presses the System Night Service button on the principal attendant console or the Night Service button on a designated voice terminal. You can assign a Night Service button to only one voice terminal.

You can activate Night Service for specific trunk groups (Trunk Group Night Service) by pressing the individual Trunk Night Service buttons on the attendant console or on a voice terminal. You can assign Trunk Night Service buttons on more than one voice terminal.

## How to administer Trunk Group Night Service

### Required forms

| Form                       | Field   | Page                  |
|----------------------------|---|-----------------------|
| Station (multi-appearance) | ■ Button/Feature Button Assignments<br>— trunk-ns | <a href="#">6-14</a>  |
| Attendant Console          | ■ Feature Button Assignments<br>— trunk-ns        | <a href="#">5-35</a>  |
| Listed Directory Numbers   | ■ Night Destination                               | <a href="#">5-207</a> |

## Considerations

### Considerations for Hunt Group Night Service

- Both Hunt Group Night Service and Trunk Group Night Service can be active at the same time. An incoming trunk call is redirected to the trunk group's designated NSE. If this NSE is a hunt group or split that is in Hunt Group Night Service mode, the call is redirected to the Hunt Group NSE.

- Calls in progress (such as talking, on hold, or waiting in queue) on the hunt group or split are not affected when the hunt group or split is put in Hunt Group Night Service mode.
- When a hunt-group queue becomes empty, all idle members are placed in a busy condition.
- If Night Service is activated for a hunt group or split and a power failure occurs, the hunt group or split automatically returns to the Night Service mode.

### **Considerations for Night Console Service**

- The night console must be identical to and have the same features as the primary console. A daytime console can double as the night console.
- Night Console Service calls to the attendant group are still handled by an attendant, even though the primary and daytime attendant consoles are out of service.
- Only one night console is allowed in the system. The night console can be activated only when the primary and daytime consoles have been deactivated.
- If Night Console Service is active and a power failure occurs, the system automatically returns to Night Console Service mode when it is powered up.

### **Considerations for Night Station Service**

- When Night Station Service is active but you have not established Night Station extensions, a user can activate Trunk Answer from Any Station (TAAS).
- You can assign a Night-Serv button to either an attendant extension or a voice-terminal extension. An individual trunk group or hunt group can be put into night service by either an attendant extension or a voice-terminal extension with the necessary button. When a user presses this button to activate Night Station Service, all calls to that particular trunk group or hunt group are routed to the Night Service extension assigned to that group.
- If a trunk without disconnect supervision goes to Night Service, the system drops the trunk after a period of time to avoid locking up the trunk. The call is not routed to the DID-LDN night extension.

### **Considerations for TAAS**

- If Night Service is active and a power failure occurs, the system, when brought back up, automatically returns to Night Service mode.

## Considerations for Trunk Group Night Service

- All incoming calls on Night Service trunk groups go to the trunk group's NSE unless the trunk group member has its own Trunk Group Member Night Destination, in which case the calls are redirected to that destination instead of the trunk group's NSE.
- Calls already in progress on a trunk group (such as talking, on hold, or waiting in queue), are not affected when the individual Trunk Group Night Service or System Night Service is activated.
- Trunk Group Night Service and System Night Service work independently of one another.
  - When a user activates System Night Service, any trunks that are controlled by individual Trunk Group Night Service buttons remain in day service. Trunk groups that are not currently assigned to Trunk Group Night Service are assigned to System Night Service.
  - Trunks with individual Trunk Group Night Service can be removed from Night Service even though the rest of the system remains in Night Service.
  - When a user deactivates System Night Service, any trunks that have individual Trunk Group Night Service still active remain in night service.
  - Trunks with individual Trunk Group Night Service can be placed into Night Service even though the rest of the system remains in day service.
- If a trunk is added to a trunk group while that trunk group is in Trunk Group Night Service, the trunk is brought up in night service.
- Individual Trunk Group Night Service does not apply to DID trunk groups.
- If Night Service is activated for a trunk group, and a power failure occurs, the trunk group automatically returns to the Night Service mode.
- If for some reason, a voice terminal with a trunk-ns button remains out-of-service after a system reboot and later comes back in service, the trunk-ns lamp shows the trunk status within 10 seconds of coming back in service. For example, a voice terminal with a trunk-ns button may be unplugged when the system is rebooted. If the voice terminal is later plugged back in, the trunk status is shown on the trunk-ns button within 10 seconds.

## Interactions

---

### Interactions for Hunt Group Night Service

- ACD

When Hunt Group Night Service is active for a split and the night-service destination is a hunt group, the caller hears the first forced announcement for the original split. The system then redirects the call to the Night Service destination hunt group. When an agent in the Night Service hunt group becomes available, the call goes to that agent. If all agents in the hunt group are busy, the caller hears the following: forced or delayed first announcement, ringback, music-on-hold or silence, and a second announcement.

- Call Coverage

When Hunt Group Night Service is active, the NSE's normal coverage criteria and path apply. If the coverage path destination is AUDIX, AUDIX answers with the mail of the original hunt group. If the NSE is a hunt group or split of any type, the hunt group or split's call coverage criteria and coverage path apply. The coverage criteria and path can be different from that assigned to the voice terminals that are members of that hunt group or split.

If a coverage point is a hunt group or split in Night Service, the system considers the point to be unavailable and does not forward the call to the coverage point's NSE.

- Call Forwarding All Calls

If a hunt group or split is in Hunt Group Night Service mode and the hunt group or split's NSE has Call Forwarding — All Calls active, the system forwards night-service calls terminating to that NSE to its designated call-forward extension.

If the forwarded-to destination is a hunt group or split in Night Service mode, the system terminates the call at the forwarding extension.

### Interactions for Night Console Service

- Trunk Group Night Service

Activation of Night Console Service for the attendant consoles also puts trunk groups into night service, except those trunk groups for which you administered a Trunk Group Night Service button.

## Interactions for Night Station Service

- Call Coverage

Calls routed to the night extension via Night Station Service follow the coverage path of the night extension under all coverage criteria except Send All Calls.

If a night extension has a coverage path in which Cover All Calls is administered, all attendant-seeking calls redirect to coverage. Changes to the protocol for handling DID-LDN calls (that is, forwarding attendant-seeking calls on or off premise from the night extension) do not work.
- Call Forwarding All Calls

Calls redirected to the attendant via Call Forwarding All Calls do not route to the DID-LDN extension.
- Inward Restriction

Inward-restricted voice terminals can be administered for Night Station Service. Night Service features override Inward Restriction.
- Night Console Service

Do not provide Night Console Service with this feature.
- Remote Access

A Remote Access extension can be specified as the Night Station extension on an incoming, non-DID, trunk group.
- Tenant Partitioning

Each tenant may have a designated night-service station. The system directs calls to an attendant group in night service to the night-service station of the appropriate tenant (when a night attendant is not available). When someone places an attendant group into night service, all trunk groups and hunt groups that belong to tenants served by that attendant group go into night service. In this case, the system routes incoming calls to the night-service destination of the appropriate tenant.

Each tenant can have its own listed directory number (LDN) night destination, trunk answer on any station (TAAS) port, or night attendant.
- Timed Reminder

Timed Reminder calls returning to a console that has been placed in Night Service and has an assigned DID-LDN night extension are not redirected to the DID-LDN night extension. Rather, they are dropped.
- Trunk Answer from Any Station

TAAS and Night Station Service can both be assigned within the same system, but cannot be assigned to the same trunk group.

## Interactions for TAAS

- Call Coverage

If Night Station Service is active, calls that are redirected to the attendant via Call Coverage can be answered via TAAS.
- Call Forwarding All Calls

If Night Station Service is active, calls that are redirected to the attendant via Call Forwarding All Calls can be answered via TAAS.
- Inward Restriction

Inward-restricted voice terminals can activate TAAS for incoming trunk calls. Night Service features override Inward Restriction.
- Night Console Service

Do not provide a Night Console Service with TAAS.
- Night Station Service

TAAS and Night Station Service can both be assigned within the same system, but cannot be assigned to the same trunk group. Activating Night Station Service also activates Night Service — Trunk Group for any trunk group without an individual trunk-group Night Service button.
- Tenant Partitioning

Each tenant can have its own listed directory number (LDN) night destination, trunk answer on any station (TAAS) port, or night attendant.

## Interactions for Trunk Group Night Service

- Call Forwarding All Calls

If the individual Trunk Group Night Service mode and the trunk group's NSE have Call Forwarding All Calls activated, the night service calls terminating to that NSE are forwarded to the designated extension.
- Forced First Announcements

An interaction occurs with System Night Service and Forced First Announcement. For example, if hunt group A has a forced first announcement, assign the incoming CO trunk to terminate at hunt group A. Assign the incoming trunk's night-service destination to be another hunt group (hunt group B). Assign a Night Service button to the attendant.

With night service active on the attendant, the incoming CO call routes to the night-service destination hunt group B and does not play the Forced First Announcement of the incoming destination's hunt group A.

- **Listed Directory Number**

In System Night Service mode, all incoming LDN calls (except those using DID trunks) which have activated night service are redirected to their corresponding trunk group's NSE. Incoming LDN calls using DID trunks are directed to the Night Console Service, Night Station Service, or Trunk Answer From Any Station, respectively, whichever applies first. Non-LDN DID trunk calls terminate at the dialed extension.

## Off-Premises Station

---

Off-Premises Station allows a voice terminal located outside the building where the switch is located to be connected to the system. If central office (CO) trunk circuits are used, the voice terminal must be analog and must be FCC-registered or, outside the US, registered by the appropriate governmental agency. See *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference* for cabling distance information for the various voice terminal types.

Digital protocol communications (DPC) sets can be used as off-premises terminals with the addition of the DEFINITY extender.

### How to administer Off-Premises Station

---

You administer off-premises stations in the same way as on-premises voice terminals, with the following exceptions. For voice terminals used as off-premises stations:

- `Off-Premises Station` field must be administered as yes.
- `R Balance Network` field must be completed.

#### Required forms

---

| Form             | Field                 | Page                 |
|------------------|-----------------------|----------------------|
| Station (Analog) | ■ Off Premise Station | <a href="#">6-28</a> |
|                  | ■ R Balance Network   |                      |

---

### Detailed description

---

Off-Premises Station requires cross-connecting capabilities and one port on a TN742, TN746B, or TN769 analog line or TN767 or TN464 DS1 tie trunk circuit pack for each interface to be provided. The TN746B, which is a 16-port, 48-volt circuit pack, can support an off-premises station. The TN746, which is a 16-port, 24-volt circuit pack cannot support an off-premises station.

#### NOTE:

The use of a message waiting indicator lamp on an off-premises station is not supported.

### Considerations

---

- Off-premises stations are useful when it is necessary to have a voice terminal located away from the main location.
- The maximum loop distance for off-premises stations is 20,000 feet (6093.34 meters) without repeaters.

## Interactions

---

The Distinctive Ringing feature might function improperly at an off-premises station due to the distance. However, the Distinctive Ringing feature can be disabled when `Off-Premises Station` is administered. If the Distinctive Ringing feature is not used with an off-premises station, the terminal receives 1-burst ringing for all calls.

## On-Hook Dialing

---

On-Hook Dialing allows 6400- and 8400-series voice terminal users to use keypad dialing without first going off-hook.

### How to administer On-Hook Dialing

---

#### Required forms

---

| Form                              | Field                                    | Page                  |
|-----------------------------------|--|-----------------------|
| Feature Related System Parameters | ■ On-hook Dialing on 6400/8400 Terminals | <a href="#">5-113</a> |
| Station                           | ■ Speakerphone                           |                       |

### Detailed description

---

On-Hook Dialing activates the built-in 1-way or 2-way speakerphone on 6400- and 8400-series voice terminals. Administer the speakerphone on the Station form.

### Considerations

---

When you first activate On-Hook Dialing, to make sure that the phone is in the S-channel signaling mode, you must go on-hook and then off-hook.

### Interactions

---

None.

## PC Console

---

PC Console is a telephone application that provides all of the functionality of the attendant console on any Windows-based PC. It is used as a call-handling station to answer incoming calls and place outgoing calls, and to manage and monitor some system operations.

PC Console supports the following languages: English, Parisian French, Latin American Spanish, and German. You can customize any of these languages, or input your own language.

### How to administer PC Console

---

#### Required forms

---

| Form               | Field | Page                 |
|--------------------|-------|----------------------|
| Console-Parameters | ■ All | <a href="#">5-86</a> |
| Attendant Console  | ■ All | <a href="#">5-35</a> |

### Interactions

---

None.

## PC/PBX Connection

---

PC/PBX Connection provides an integrated-voice and data-workstation interface from DEFINITY ECS to a 6300 or other compatible personal computer (PC). The connection provides access to a variety of host computers, allowing the PC to act as a terminal for the host.

### How to administer PC/PBX Connection

---

#### Required forms

---

| Form              | Field | Page                  |
|-------------------|-------|-----------------------|
| Personal Computer | ■ All | <a href="#">6-153</a> |

### Detailed description

---

PC/PBX Connection is a PC application that runs on the PC/PBX platform. This feature brings the voice terminal and PC together into an integrated voice and data workstation. The PC can be any IBM-compatible PC.

Lucent Technologies provides the hardware for this connection. The hardware consists of a PC expansion card and a 7-foot 4-pair modular cord. The software includes a variety of packages available from different vendors. Contact your Lucent Technologies representative for more information.

### Security measures

---

There are two areas where unauthorized use may develop with this feature. The first involves unauthorized users with a PC attempting to make calls from it. The software in the PC has a security setting. A user can place the PC in security mode when it is left unattended. Automatic security is an option on the administration program. With Automatic security enabled, executing the software brings up the program in security mode. This mode is password-protected on the PC. Change the password often, and secure records of it.

The second area involves remote access to the PC over its data extension. Deleted or copied files store in the PC with this feature. This can be password-protected. Change the password frequently and secure. Consult the *BCS Product Security Handbook*, for additional steps to secure your system and to find out about obtaining information regularly about security developments.

## Considerations

---

- PC users with PC/PBX Connection are linked for easy access to other PCs, modem pooling, and on- and off-site computers.

## Interactions

---

- Call Log

When a station is optioned for PC/PBX Connection on the station form, and if using a display set, the call display is slightly altered. Omit the appearance identifier (a=, b=, c=, d=). If enabling the Call Log feature in the PC/PBX Connection software, the display information is captured to disk. You can search the log. Search criteria begins at the left of the displayed information. By omitting the appearance designator, a user can enter a search string without contending with the appearance identifiers in the displayed information.

## Software requirements

---

Install one of the following PC/PBX software packages on the PC:

- **PC/PBX Connection Package 1**

Provides features such as keyboard dialing, personal phone directory, directory dialing, and message retrieval. Hardware requirements include PC, 7404D voice terminal equipped with a message cartridge.

- **PC/PBX Connection Package 3**

Provides Package 1 services plus additional features (call log, higher file transfer rates, and the ability to take notes on a call). Hardware requirements include PC equipped with a DCP card and a 7400D series voice terminal. Package 3 provides an integrated voice and data workstation that supports:

- Dialing calls from the PC
- Use of customized phone features from the PC keyboard
- Creating a personal phone directory in the PC, searching the directory, and dialing voice and data calls from the directory
- Reading phone messages on the PC screen and having the PC automatically dial calls to users that have left messages
- Logging all incoming and outgoing calls (voice and data) and the ability to automatically recall them
- Using an associated speakerphone to make hands-free calls
- Use of a security feature to keep directory and message information private

- Use of the PC as a terminal connected to a variety of host computers
- Transferring files between the PC and another PC or host computer
- Setting up script programs to have the system perform selected data functions automatically
- Using voice and data functions simultaneously. Perform PC application while running the PC/PBX Connection software application in the background

■ **PC/PBX Connection Package 5**

Package 5 allows the PC to emulate a 3278/3279 terminal. This is a software enhancement to Package 3 and works with Package 3 hardware and software.

## Personal Station Access

---

Personal Station Access (PSA) allows a user whose station is translated to his or her own preferences and permissions to associate those preferences and permissions with any other compatible terminal. Preferences and permissions include the definition of terminal buttons, abbreviated dial lists, and COS and COR permissions assigned to the user's station. PSA requires the user to enter a security code. PSA can be used on-site or off-site.

### How to administer PSA

---

#### Required forms

---

| Form                              | Field  | Page                  |

| Station                           | ■ Security Code  | <a href="#">6-28</a>  |
| Feature Access Code (FAC)         | ■ Personal Station Access (PSA) Associate Code and Dissociate Code | <a href="#">5-113</a> |

### Detailed description

---

PSA makes it convenient for different users to use the same bank of phones at different times. For example, several telecommuting employees can use the same office on different days of the week. The employees use PSA to “associate” with the office voice terminal — that is, make the terminal “theirs” for the day. Calls that an employee originates from the station are recognized and displayed as the employee's calls, and the calls routed to the employee's extension route to the voice terminal “associated” with that extension.

Many types of DCP terminals exist, and these terminals have different types and numbers of buttons. If you attempt to associate DCP stations with DCP terminals that have incompatible buttons, button mapping is unpredictable. This is also true of hybrid terminals. If you want a user to be able to use the terminal buttons and to have consistent displays, associate stations with terminals of the same type.

When the employee no longer needs to use the office, he or she “dissociates” from the terminal.

A telecommuting employee can also use PSA when working at home. For example, the employee installs a DCP terminal and a DEFINITY Extender at home, calls into the system, and uses PSA to associate the remote voice terminal

with their extension. The system associates the home terminal — that is, recognizes the home terminal as having the employee’s preferences and permission. When someone calls the employee’s extension, the call rings at the employee’s home.

The dissociate function within PSA allows a user to restrict the features available to a voice terminal. When a terminal has been dissociated using PSA, it can be used only to call an attendant or to accept a TTI or PSA request.

 **NOTE:**

Once a station has been associated with a terminal, anyone using the terminal has the capabilities of the associated station. Be sure to execute a dissociate request if the terminal can be accessed by unauthorized users. This is particularly important if you use PSA and DCP extenders to permit remote DCP access.

**End-user procedures**

The user executes the following steps to make a station his or hers. If a user enters more than 15 digits before entering the second #, the system generates intercept tone.

**Table 4-83. Personal Station Access procedures**

| User Action                             | System Response   | Result  |
|---|---|---|
| 1. Enter the PSA associate FAC.         | <ul style="list-style-type: none"> <li>■ Dial tone</li> <li>■ Intercept tone</li> </ul> | <p>The request is successful.</p> <p>The request is not successful because it was not made at an analog, hybrid, or DCP terminal.</p> <p>The request is not successful because the terminal is associated with or assigned to a station that does not have PSA permission in its COS.</p> |
| 2. Enter user extension, followed by #. | <ul style="list-style-type: none"> <li>■ No response</li> </ul>                         | <p>If the user is working at a terminal with display capabilities, this pound sign is the last character the system displays until the PSA sequence is completed.</p>   |

*Continued on next page*

Table 4-83. Personal Station Access procedures — *Continued*

| User Action   | System Response   | Result  |
|---|---|---|
| <p>3. Enter the Station Security Code (SSC) defined for the user's extension, followed by the second #.</p> | <ul style="list-style-type: none"> <li>■ Confirmation tone</li> </ul> | <p>The command sequence is complete and error free; the system queues the request.</p> <p>Under the following conditions, the user receives intercept tone <i>immediately</i> following the confirmation tone. If the user receives intercept tone, the user needs to execute the PSA request again.</p> <ul style="list-style-type: none"> <li>— TTI is not enabled for voice.</li> <li>— Either the dialed extension or the originating extension has an add, change, or remove action in progress.</li> </ul>  |
|   | <ul style="list-style-type: none"> <li>■ Intercept tone</li> </ul>    | <p>The request is not successful because the user entered incompatible extension and SSC information — that is, the extension is invalid, the SSC is invalid for the extension, or both. This will be logged as an invalid attempt by the Security Violation Notification (SVN) feature.</p> <p>The request is not successful because the user has requested association with a station that does not have PSA permission in its COS.</p> <p>The request is not successful because the user is attempting to associate a station in one tenant partition to a station in another partition.</p> |
|   | <ul style="list-style-type: none"> <li>■ Reorder tone</li> </ul>      | <p>The request is not successful because the dialed extension is in use.</p> <p>The request is not successful because an agent is logged in at the dialed extension.</p> <p>The request is not successful because the system load is too heavy to allow the requested action to occur. The user can try again later.</p>  |

## How to interrupt the associate command sequence

If the user realizes that he or she has entered incorrect information following the FAC and wishes to interrupt the command sequence and begin again, the user can enter an asterisk (\*) at any point before the second pound sign. When the user enters an asterisk, the system provides dial tone, and the user can begin the command sequence at the point of entering the user's extension. (The user should not enter the FAC again). The interrupted command sequence will not be recorded as an invalid attempt by the SVN feature.

## How to use PSA dissociate

The user enters the PSA dissociate FAC to dissociate his or her station from a terminal. The possible system responses to this request are described below.

- Confirmation tone  
The request is successful. The system provides confirmation tone if the system successfully dissociated the terminal and also if the terminal was not previously associated. In either case, the terminal is in the state requested by the user.
- Intercept tone  
The station does not have PSA permission in its COS.

## Considerations

---

- A user request for a PSA associate will automatically dissociate another station from the terminal.
- Extensions that do not have a COS, such as EAS agents or hunt groups, cannot use PSA.
- PSA-invalid attempts generate referral calls and are recorded by Security Violation Notification software, if that feature is enabled.
- If a user interrupts the PSA dialing sequence by pressing the release button or by hanging up, the system does not log the action as an invalid attempt.

- PSA functions only on analog, hybrid, and DCP terminals. In addition, the terminal at which the PSA request is made must be compatible with the terminal to which it is to be associated. The following table provides a list of permissible associations.

| Type of terminal at which PSA request is made | Type of Station to be associated |        |        |     |
|---|----------------------------------|--------|--------|-----|
|   | BRI                              | Analog | Hybrid | DCP |
| BRI   | No                               | No     | No     | No  |
| Analog  | No                               | Yes    | No     | No  |
| Hybrid  | No                               | No     | Yes    | No  |
| DCP   | No                               | No     | No     | Yes |

- The system does not limit the number of stations that can use PSA. However, heavy use of the associate and dissociate functions may temporarily impact system performance.
- PSA allows a dissociate request from a bridged appearance. However, when a user executes a dissociate command from Terminal B, even if the user is on a bridged appearance of an extension belonging to Terminal A, the user dissociates the station belonging to Terminal B.
- Stations and ports on different switches cannot be PSA associated. This includes stations on different switches (or nodes) within DCS environments.
- PSA commands cannot be successfully executed during a save translations.
- When a reset 3 or greater (reset 4, reset 5, and so on) occurs on the system, all associations revert to their state as of the last save translations.

## Interactions

---

- Adjunct/Switch Application Interface  
An ASAI link cannot use this feature because ASAI uses a BRI port. Do not assign an ASAI link to a COS that allows PSA.
- Bridged Appearance  
When a user executes a PSA dissociate request for the principal station, its bridged appearances remain active if the stations on which they appear have not been dissociated. When a call is made to the principal extension, any of its bridged appearances that can be alerted are alerted. Otherwise, the call follows the principal extension's coverage path.  
PSA dissociate requests executed at a bridged appearance dissociates the station that the bridged appearance is on.

## 4 Basic Features

### *Personal Station Access*

Page 4-479

- Call Management

PSA dissociate automatically logs out an ACD agent.

- Coverage

PSA does not change coverage path operations. If a station is dissociated, its calls still go to coverage unless they are forwarded.

- Property Management System

A station that is assigned to a room, rather than to a person who needs to work in multiple locations should not use PSA. Such a station should not have PSA in its COS.

- Security Violation Notification

PSA security violations are tracked and reported by SVN, if it is active.

- Tenant Partitioning

If a terminal is already associated, a user attempting a PSA associate request at that terminal must specify a station in the same partition as the station already associated with the terminal.

However, anyone, in any partition, can execute a PSA dissociate request at the terminal (if the associated station has PSA in its COS) and then execute a PSA associate request for a station in any tenant partition.

## Personalized Ringing

---

Personalized Ringing allows users of some voice terminals to have one of 8 ringing patterns for incoming calls. Users working closely in the same area can each specify a different ringing pattern. This enables the users to distinguish their own ringing voice terminal from other voice terminals in the same area.

### How to administer Personalized Ringing

---

#### Required forms

---

| Form                           | Field                          | Page                  |
|--------------------------------|--------------------------------|-----------------------|
| Station                        | ■ Personalized Ringing Pattern |                       |
| — 7303S, 7305S                 |                                | <a href="#">6-73</a>  |
| — 7404D                        |                                | <a href="#">6-90</a>  |
| — 7406D, 7406D+, 7407D, 7407D+ |                                | <a href="#">6-111</a> |
| — 7434D                        |                                | <a href="#">6-121</a> |
| — 8403B, 8405B, 8405B+, 8410B  |                                | <a href="#">6-172</a> |
| — 8405D, 8405D+, 8410D, 8434   |                                | <a href="#">6-180</a> |
| — 8411B, 8411D                 |                                | <a href="#">6-189</a> |
| — CALLMASTER II and III        |                                | <a href="#">6-141</a> |

You can administer Personalized Ringing for each voice terminal. Either you or the end-user can administer Personalized Ringing for a 7404D, 7406D, 7406D+, 7407D, or 7407D+programmable voice terminal.

### Detailed description

---

The eight administrable ringing patterns are different combinations of three tones:

- 750 Hz, 750 Hz, 750 Hz (normal ringing)
- 1060 Hz, 1060 Hz, 1060 Hz
- 530 Hz, 530 Hz, 530 Hz
- 530 Hz, 1060 Hz, 1060 Hz
- 1060 Hz, 1060 Hz, 530 Hz
- 1060 Hz, 530 Hz, 530 Hz
- 1060 Hz, 530 Hz, 1060 Hz
- 530 Hz, 1060 Hz, 530 Hz

## **End-user procedures**

The 7404D user can select the desired ringing pattern via the voice-terminal's menu options. The 7406D or 7407D user can select the desired ringing pattern by pressing the Shift key and the Select Ring button. The 7103A programmable voice-terminal user can select one of four ringing patterns via a slide switch on the voice terminal.

## **Power failures**

The user-specified ringing pattern for a 7404D, 7406D, 7407D, or CALLMASTER digital voice terminal is lost when the power fails. The user-specified ringing pattern is retained for ISDN-BRI voice terminals when the power fails.

## **Interactions**

---

- **Distinctive Ringing**

With Distinctive Ringing, you can administer the relationship between the number of ring bursts and the call type. The Personal Ringing Pattern selected is the same ringing pattern used in the Distinctive Ringing cycles.

## Power Failure Transfer

---

Power Failure Transfer provides service to and from the local telephone company central office (CO) during a power failure or when service is impaired.

Power Failure Transfer is also call Emergency Transfer; the terms are synonymous.

### How to administer Power Failure Transfer

---

None required

### Detailed description

---

Power Failure Transfer allows specific types of voice terminals to access the local CO and to answer incoming calls during a power failure.

Each DEFINITY ECS cabinet supports Power Failure Transfer panels via the AUX connectors on the rear panel. The Power Failure feature activates when:

- A transfer panel or associated cabinet loses power
- Manually activating the Emergency Transfer switch on the associated cabinet maintenance circuit pack
- Under software control when it is determined that service for that cabinet is severely impaired

You cannot activate any other system features during a complete system power failure.

Power Failure Transfer panels are available in multiples of five terminals.

Voice Terminals must be 500-type (rotary dial) or 2500-type (touch-tone or DTMF). You must use rotary dialing if the CO accepts dial pulses only. When a DEFINITY ECS system is not in Power Failure Transfer mode, power-failure transfer terminals can be used as regular extensions. Each voice terminal can be connected to a separate CO.

### Interactions

---

- Night Service  
If a power failure occurs when the system is in night service, the system automatically returns to night service when power returns.

## Priority Calling

---

Priority Calling provides a special form of call alerting between internal voice-terminal users, including the attendant. The called party receives a distinctive ring when the calling party uses Priority Calling.

### How to administer Priority Calling

---

#### Required forms

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Feature Access Code (FAC)         | ■ Priority Calling Access Code                    | <a href="#">5-113</a> |
| Class of Service                  | ■ Priority Calling                                | <a href="#">5-81</a>  |

| Station (multiappearance)         | ■ Button/Feature Button Assignments<br>— priority | <a href="#">6-14</a>  |
| Feature-Related System Parameters | ■ Distinctive Audible Alerting                    | <a href="#">5-123</a> |

### Detailed description

---

You administer the priority-calling ringing-pattern system wide. Default is a 3-burst alerting signal. You allow feature use for each voice-terminal user by administering the user's class of service.

The following types of calls are always priority-calling calls:

- Call coverage consult
- Automatic callback
- Ringback queuing
- Attendant intrusion
- Security violation notification

The system generates the call waiting ringback tone that a single-line voice-terminal user hears even if the user is active on a call. In contrast, the system *does not* generate the pattern for a multiappearance voice-terminal if there are no idle call appearances. In this case the caller hears busy tone. However, the system does generate the pattern if the terminal has an idle call appearance, including the one reserved for call origination.

A user activates priority calling by dialing a priority-calling access code or pressing a priority button, followed by the desired extension. A user can change a normal call to a priority call even after it begins ringing at the called extension. The user does this by pressing the priority button.

## Interactions

---

- **Abbreviated Dialing**

If a priority call is to be made to a number in an abbreviated dial list, an Abbreviated Dial button must be used. If a user attempts to use Abbreviated Dialing (either by button or FAC) after dialing the Priority Access Code, the system denies the call.
- **Bridged Call Appearance**

A Bridged Call Appearance receives ringing on a priority call if its Bridged Call Alerting field on the Station form is **y**.
- **Call Coverage**

Priority Calling calls do not redirect to coverage unless the caller activates Go to Cover. If the call redirects, it remains a priority call, and the covering user receives a distinctive (default is three-burst) ringing signal.
- **Call Forwarding All Calls**

Priority Calling calls (except callback calls) are forwarded, and the forwarded call remains a priority call.
- **Call Vectoring**

The system generates intercept tone when someone attempts to activate Priority Calling toward a Vector Directory Number (VDN).
- **Call Waiting Termination**

A Priority Calling call waits on an active single-line voice terminal even if Call Waiting Termination is not assigned to the voice terminal. The active, single-line voice-terminal user receiving the call hears a distinctive (default is three-burst) priority Call Waiting tone.
- **Consult**

A Consult call acts as a priority call and waits at a single-line voice terminal, even if the terminal does not have Call Waiting Indication assigned.
- **Dial Access to Attendant**

A Priority Calling call to an attendant alerts the attendant as a non-priority call. The attendant can originate Priority Calling calls.

- Distributed Communications System

On a DCS tandem call to a single-line voice terminal, the called party does not receive priority ringing if the caller activates Priority Calling by pressing the priority button *after making a call*.

- Last Number Dialed

If a priority call is to be made to the last number dialed, the Last Number Dialed button must be used. The Last Number Dialed feature access code is not valid after Priority Calling has been activated.

Single-line voice terminals (2500 series) can be administered so that distinctive signals are not provided. In this case, 1-burst ringing is provided for priority calls.

- Security Violation Notification

Security Violation Notification calls are priority calls.

## Privacy — Attendant Lockout

---

Privacy — Attendant Lockout prevents an attendant from reentering a multiple-party connection held on the console unless recalled by a voice-terminal user.

### How to administer Privacy — Attendant Lockout

---

#### Required forms

---

| Form               | Field               | Page                 |
|--------------------|---------------------|----------------------|
| Console-Parameters | ■ Attendant Lockout | <a href="#">5-86</a> |

### Considerations

---

- Privacy — Attendant Lockout provides privacy for parties on a multiple-party call held on the console. The held parties can hold a private conversation without interruption by the attendant.

### Interactions

---

- Attendant Recall  
Use Attendant Recall to recall the attendant to a call that is originally conferenced or held by the attendant.
- Individual Attendant Access  
Privacy — Attendant Lockout applies only to attendant-group calls. It does not affect individual attendant calls.
- Trunk-to-Trunk Transfer  
Privacy — Attendant Lockout does not function when a call using Trunk-to-Trunk Transfer is held on the console.

## Privacy — Manual Exclusion

---

Privacy — Manual Exclusion allows multiappearance voice-terminal users to keep other users with appearances of the same extension from bridging onto an existing call.

### How to administer Privacy — Manual Exclusion.

---

#### Required forms

---

| Form                      | Field   | Page                 |
|---------------------------|---|----------------------|
| Station (multiappearance) | ■ Button/Feature Button Assignments — exclusion | <a href="#">6-14</a> |

---

### Detailed description

---

To activate Privacy — Manual Exclusion for a call, press the Exclusion button.

If you press the Exclusion button while other users are bridged onto the call, the other users are dropped from the call.

Privacy — Manual Exclusion is automatically deactivated when the Exclusion button is pressed a second time or when the party who activated Privacy — Manual Exclusion is dropped from the call.

### Considerations

---

Privacy — Manual Exclusion prevents users who have an appearance of another terminal's extension from bridging onto that extension.

### Interactions

---

- Bridged Call Appearance  
When Privacy — Manual Exclusion is activated, all other users are prevented from bridging onto the active call.
- Call Coverage  
When the principal user bridges onto a call that has gone to coverage and been answered at the coverage point, the principal user is not dropped when Privacy — Manual Exclusion is activated.

#### 4 Basic Features

##### *Privacy — Manual Exclusion*

Page 4-488

- Call Pickup

The called party is not dropped in the following scenario when Privacy — Manual Exclusion is activated: a call is made to a Station A and is picked up, using Call Pickup, by Station B. Station A then bridges onto the call by going off-hook on its call appearance. Station B activates Privacy — Manual Exclusion.

## Public Network Call Priority

---

Public Network Call Priority provides Call Retention, Forced Disconnect, Intrusion, Mode-of-Release Control, and Rering to switches on public networks. Different countries frequently refer to these capabilities by different names. Not all features are available in every country.

### How to administer Public Network Call Priority

---

## Detailed description for China

### Forced Disconnect

Forced Disconnect allows a network operator to disconnect a called party from a local call and connect the called party to an incoming toll call. Parties on the local call hear a warning tone before disconnect. Forced Disconnect is allowed only for callers on local single-station calls. It is ignored by DEFINITY ECS on conference, transferred, and forwarded calls. It is also ignored for calls to group users and tandem calls.

### Mode-of-Release Control

Mode-of-Release Control inhibits release of a trunk circuit when a caller goes on-hook, based on call type and direction. Instead of releasing the trunk circuit, DEFINITY ECS keeps the circuit active and reconnects the call if the caller goes back off-hook. Call types for which this applies are toll, local, or service. Direction is incoming or outgoing. There are three types of control.

#### Calling-Party Control

When Calling-Party Control is active, the trunk is not released until the caller goes on-hook. Several situations may occur.

- If the caller goes on-hook, the trunk is released immediately. The called party receives busy tone.
- If the called party goes on-hook, the trunk is not released until the caller goes on-hook or the re-answer timer for outgoing calls expires. The called party can re-answer the call and talk to the calling party. See [“Rering” on page 4-491](#).
- If the re-answer timer is activated and expired, the trunk is released on outgoing calls with Calling-Party Control.

#### Called-Party Control

When Called-Party Control is active, the trunk is not released until the called party goes on-hook. Several situations may occur.

- If the called party goes on-hook, the trunk is released immediately. The caller receives busy tone.
- If the caller goes on-hook, the trunk is not released until the called party goes on-hook. The caller can go off-hook again to reconnect. There is no timer involved with Called-Party Control.

#### First-Party Control

When First-Party Control is active, the trunk is released immediately regardless of whether the caller or called party goes on-hook first. The party that is still connected receives busy tone. The default or normal Mode-of-Release Control for DEFINITY ECS is First-Party Control.

## Rering

Rering occurs for incoming calls to DEFINITY ECS with Calling-Party Control. Basically, when the called party goes on-hook, the trunk is not released and Rering allows the CO operator to rering the called party and reconnect the call.

### Detailed description for Russia

#### Intrusion

Intrusion allows a network operator to break into a local call and announce an incoming toll call. Intrusion is allowed on local, single- and multiple-line station calls. It is ignored by DEFINITY ECS on conference calls, calls on hold, and other toll calls.

## Rering

Rering occurs when a call is interrupted by an operator-assisted incoming call and kept on hold so that it can be reconnected to a voice terminal. When the called party goes on-hook, the network toll operator can rering the called party and reconnect the call.

### Detailed description for Spain

#### Call Retention

When a caller makes an emergency call and then hangs up, the call is not disconnected, but put on hold. When the caller goes back off-hook, the caller's voice terminal reconnects to the emergency call. This feature works on both analog and digital voice terminals.

## Rering

Rering occurs when a call is interrupted by an operator-assisted incoming call and kept on hold so that it can be reconnected to a voice terminal. When the called party goes on-hook, the network toll operator can rering the called party and reconnect the call.

### Interactions

#### China Forced Disconnect Interactions

- Conference

If the network toll call terminates at a voice terminal involved in a conference, the Forced Disconnect signal is not sent by the network.

**4 Basic Features**

*Public Network Call Priority*

*Page 4-492*

- **Call Forwarding**  
For calls forwarded on-premises, on-net, or off-net, the Forced Disconnect signal is not forwarded.
- **Group Users**  
If a network toll call terminates to a group user, the Forced Disconnect signal is not sent by the network.
- **Non-Station Users**  
If a network toll call terminates to a non-station user, the Forced Disconnect signal is not sent by the network.
- **Tandem Trunks**  
DEFINITY ECS does not tandem a Forced Disconnect signal.
- **Transfer**  
If a network toll call is transferred, the Forced Disconnect signal is not sent by the network.

**China Mode-of-Release Control Interactions**

- **Conference**  
A call involved in a conference is changed to First-Party Control as the mode-of-release control.
- **Forward**  
A forwarded call on-premises, on-net, or off-net is changed to First-Party Control as the mode-of-release control.
- **Group Users (Hunt, Trunk, TEG, AUDIX, VDN)**  
Calls terminating to group users are changed to First-Party Control as the mode-of-release control.
- **Non-Station Users (Personal Attendant, Data-module, Announcement, Voice Synthesis)**  
Calls terminating to non-station users are changed to First-Party Control as the mode-of-release control.
- **Tandem Trunks**  
DEFINITY ECS terminates tandem calls, but the mode-of-release control is changed to First-Party Control.
- **Transfer**  
A transferred call is changed to First-Party Control as the mode-of-release control.

## China Rering Interactions

- Conference

A call involved in a conference is changed to First-Party Control as its mode-of-release control. First-Party Control calls do not rering.
- Call Forwarding

For calls forwarded on-premises, on-net, or off-net, Rering signals are not forwarded.
- Group Users (Hunt, Trunk, TEG, AUDIX, and VDN, etc.)

Rering signals sent to group users are ignored by DEFINITY ECS.
- Non-Station Users (Personal Attendant, Data-module, Announcement, Voice Synthesis)

Rering signals sent to non-station users are ignored by DEFINITY ECS.
- Tandem Trunks

DEFINITY ECS does not tandem rering signals.
- Transfer

A transferred call is changed to First-Party Control as its mode-of-release control. First-Party Control calls do not rering.

## Russia Intrusion and Rering Interactions

- Announcements

DEFINITY ECS ignores Intrusion and rering when directed toward an announcement port.
- Abbreviated Ringing and Delayed Ringing

Abbreviated Ringing and Delayed Ringing characteristics assigned using this feature do not apply to Rering. Rering has its own priority ringing.
- Administered Connections

Intrusion and rering do not apply to Administered Connections.
- Attendant Console

Intrusion and rering do not apply to attendant consoles. They do not apply to any call involving an attendant console.
- Attendant Serial Call

DEFINITY ECS ignores Intrusion and rering when directed toward an attendant serial call.
- Automatic Callback

Rering takes precedence over automatic callback on busy or no-answer calls.

## 4 Basic Features

### Public Network Call Priority

Page 4-494

- **Busy Verification and Attendant Intrusion**

While Intrusion or rering occurs, Busy Verification and Attendant Intrusion are denied. While Busy Verification or Attendant Intrusion occurs, Intrusion and rering are denied.
- **Call Coverage**

Rering overrides Call Coverage. However, if a station is busy and a coverage destination is free, an incoming toll call rings at the coverage destination instead of intruding on the busy call.
- **Call Forwarding**

Intrusion can be used with Call Forwarding. If a station is busy, an incoming toll call is forwarded instead of intruding on the busy call. rering, however, overrides all administered redirection.
- **Call Waiting**

If Call Waiting is active, calls are not intruded upon. Call Waiting takes precedence.
- **Conference**

Intrusion is not permitted to a call involved in a conference.
- **Data Calls**

Intrusion is not permitted to voice terminals that have data privacy, data restriction, or data protection active.
- **Distinctive Ringing**

Ringling characteristics assigned using this feature do not apply to rering. Rering has its own priority ringling.
- **Do Not Disturb**

Intrusion is not permitted while Do Not Disturb is active.
- **Emergency Access to the Attendant**

Intrusion is not permitted to an emergency call.
- **Hunt Group and Automatic Call Distribution**

If a hunt group queue is not busy, incoming toll calls are placed in the queue. Busy calls are not intruded upon.
- **Intercom (Automatic and Dial)**

Intrusion is permitted on Intercom (automatic and dial) calls.
- **Malicious Call Trace**

Intrusion is not permitted to a station that has Malicious Call Trace active.
- **Personal Station Access**

Intrusion is not permitted while Personal Station Access is used.

**4 Basic Features**

*Public Network Call Priority*

*Page 4-495*

- Pull Transfer  
Intrusion is not permitted while Pull Transfer is used.
- Restriction  
Intrusion is permitted regardless of COR.
- Ringback Queuing  
Intrusion is permitted with Ringback Queuing.
- Station Hunting  
Intrusion is permitted while Station Hunting is used.
- Tandem Trunks  
Intrusion is not permitted over trunk groups used as tandem trunks.

## Pull Transfer

---

Pull Transfer allows either the transferring or transferred-to party to press the TRANSFER button to complete the transfer operation.

### How to administer Pull Transfer

---

#### Required forms for Pull Transfer

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature-Related System Parameters | ■ Pull Transfer                                      | <a href="#">5-123</a> |
| Station                           | ■ All (including a Flash or Transfer feature button) | <a href="#">6-28</a>  |

---

### Considerations

---

When attendants control calls, called parties cannot use Pull Transfer. Attendants who are called parties cannot use Pull Transfer. When attendants have parties on hold they are transferred with the standard transfer process.

To use Pull Transfer, calling parties and called parties must be on the same switch, or called parties must be reached via Italian TGU/TGE tie trunks.

Called parties using analog telephones flash the switchhook or press the flash key or recall button to transfer calls. Called parties using digital phones press the transfer key to complete transfers.

### Interactions

---

- Analog Station Recall Operation and Feature Activation

When called parties initiate either analog-station recall or feature activation, callers are not put on hold for transfer, they are transferred via Pull Transfer.

- AUDIX

AUDIX does not work properly if Pull transfer is enabled.

- BRI stations

Callers using BRI Stations reach desired parties through an intermediate step by calling a party who calls a final destination. Intermediate parties activate pull transfer to complete transfers. Final called parties go off hook as if a new transfers was originated.

- Call Detail Recording

The switch checks to ensure that calls are correctly recorded with CDR when Pull Transfer is completed.

- Digital Station Transfer Operation

When called parties initiate transfer operations, callers are not put on hold for transfer; they are transferred via Pull Transfer.

- Non-BRI stations:

Callers using Non-BRI stations reach desired parties through an intermediate step by calling a party who calls a final destination. Each called party activates pull transfer.

## Recall Signaling

---

Recall Signaling allows the user of an analog station to place a call on hold, use the voice terminal for other call purposes, and then return to the original call.

### How to administer Recall Signaling

---

#### Required forms

---

| Form                              | Field                | Page                  |
|-----------------------------------|----------------------|-----------------------|
| Feature-Related System Parameters | ■ Flashhook Interval | <a href="#">5-123</a> |
|                                   | ■ Upper Bound        |                       |
|                                   | ■ Lower Bound        |                       |
| Station (Analog)                  | ■ Switchhook Flash   | <a href="#">6-14</a>  |

### Detailed description

---

To activate Recall Signaling:

- Press the flashhook
- Press the ground key on a rotary station
- Press the ground key or the Recall Button on a DTMF station

Recall Signaling allows the user of an analog station to place a call on hold and consult with another party or activate a feature. The user can then:

- Conference the third party with the original party by another recall signal
- Return to the original party by pressing the Recall button twice or by flashing the switchhook twice

Use Hold and Conference buttons on digital stations to perform these functions.

### Considerations

---

- You can disable Recall signaling for particular analog stations.
- You can administer how long the system recognizes the press of the flashhook as Recall Signaling or you may choose not to administer Recall Signaling at all.
- Using flashhook for Recall Signaling at times places a call on hold when the analog station user wanted to drop the previous call before dialing another party.

## **Interactions**

---

None.

## Recorded Announcement

---

The Recorded Announcement feature provides an announcement to callers under a variety of circumstances. For example, announcements let callers know that their call cannot be completed as dialed, that their call is in queue, or that all the lines are busy.

### How to administer Recorded Announcement

---

#### Required forms

| Form   | Field   | Page                  |

1. You only need to complete the Circuit Pack form if you administer the Board Location on the Announcements/Audio Sources form or Data Module form and do not have the circuit pack plugged in.
2. You only need to complete this form if you plan to use Recorded Announcements with the form's associated feature. (For example, if you want to use announcements with the Hospitality features, you need to complete the Hospitality form.)

### Detailed description

The system supports several recorded announcement types.

#### Analog line

Requires an external announcement machine connected by way of an analog line port.

- Analog — Provides an analog voice-terminal interface via an analog line port for use with an announcement/audio sources devices that emulate analog voice terminals. DEFINITY ECS starts playback by applying ringing; the device indicates playback has stopped by going on-hook (opening the loop). DEFINITY ECS does not indicate to the device to stop playback. Use the analog type for announcements that play for a specific period and then go on-hook at the end. When the device goes on-hook to indicate that the playback ended, the caller listening to the announcement hears a click. (See ds1, aux-trk or integrated types for alternative types).
- Analog-m — Like the analog type, analog-m provides an analog line interface. However, ringing is not applied to start playback. Use this type for continuous playing music or audio sources. The device stays in an off-hook state when active and goes on-hook when the device is not playing, is turned off, or is disconnected.

## 4 Basic Features

### *Recorded Announcement*

Page 4-502

- Analog-fd — Like the analog type, analog-fd provides an analog line interface and ringing starts the playback. However, a forward disconnect signal (open loop for about one-half second) is sent to the device to stop playback when there are no callers left to hear it. This type would be used for a barge-in repeating announcement.

## DS1

The DS1 types provide analog-like interfaces via DS1 line ports — called Line Side DS1 or Line Side T1. Each of these types indicate to the announcement, music, or audio-source device to start playback via the Line Side T1 equivalent of ringing. The DS1 types also expect off-hook from the device to indicate that the playback is active and on-hook to indicate that the playback is not active.

The ds1-fd and ds1-sa types provide a forward disconnect via transitions of the “A” signaling bit to the device which indicates when playback should be stopped. Callers listening to announcements do not hear clicks when the device disconnects (goes on-hook).

- ds1-fd — Provides an EIA/TIA foreign-exchange (FX) type DS1 interface. The forward disconnect signal is a toggle of the “A” bit from 0 to 1 and then back to 0 after 600 msec. This type is used for CONVERSANT Line Side T1 ports when used as an analog-like announcement device and is the recommended method for interfacing.
- ds1-sa — Provides an EIA/TIA special-access type DS1 interface. The forward disconnect signal is a toggle of the “A” bit from 1 to 0 and then back to 1 after 600 msec.
- ds1-ops — Provides an EIA/TIA off-premises-station type DS1 interface used where the device does not support forward disconnect.

## Auxiliary trunk

Requires an external announcement machine connected via a 4-wire auxiliary trunk interface, such as a 15A announcement system. DEFINITY ECS indicates to the device to start or stop the playback on the S lead; the device indicates that the playback is active on the S1 lead.

## Integrated

Is stored internally on the switch on an Integrated Announcement circuit pack (TN750). Each circuit pack has 16 ports available for playing announcements. This is the recommended source for VDN of Origin Announcements as well as other general announcement needs.

## When to use the feature

This is a list of some useful applications for Recorded Announcements.

- DID calls cannot be completed as dialed.
- Incoming private-network-access calls cannot be completed as dialed.
- Calls enter a split or skill (first announcement).
- DDC, UCD, or direct-agent calls have been in queue for an assigned interval.
- ACD and Call Vectoring calls have been in queue for an assigned interval.
- A call's destination is a recorded-announcement extension.
- A call routes to a vector that contains an announcement step.
- An announcement extension is specified as a coverage point.
- An announcement is the incoming destination of a trunk group.
- VDN of origin announcement
- Security violation notification
- The Hospitality Automatic Wakeup feature is in use.

## About barge-in

Normally, the system connects multiple callers to the beginning of an announcement, regardless of announcement type. However, you can also administer auxiliary trunk announcements, DS1 announcements, and integrated announcements to allow callers to begin listening to an announcement after the system has begun playing its message. This capability is called "barge-in."

### What happens when you use barge-in

When you administer "barge-in", only one port plays the announcement at any one time. When the system routes a call to that announcement, the call immediately connects to the port and the caller hears the announcement as it is playing. Most administrators administer "barge-in" announcements to repeat continually while callers are connected to the port. In this way, the caller listens until the system plays the entire announcement.

### What happens when you do not use barge-in

If an announcement port is available when a call arrives, the system connects the call to the announcement.

If an announcement port is not available and the announcement is administered with "no" as the queue option, the caller hears busy or other feedback depending upon how the announcement was accessed.

If an announcement port is not available and the announcement is administered with "yes" as the queue option, the call enters the announcement queue. When a

port becomes available, the switch connects the calls waiting in the queue to the beginning of the announcement. The system first connects the call that has been waiting in queue the longest and then connects as many calls as it can.

## Integrated announcements and announcements recorded on external devices

Recorded Announcement allows you to administer either integrated announcements or announcements recorded on external devices. The external devices connect to the switch via analog-line circuit packs or auxiliary trunk interfaces, such as a TN2183 or a TN763.

The system stores an integrated announcement on a TN750 integrated-announcement circuit pack. The system can store multiple announcements on each circuit pack up to the system capacity. See *DEFINITY Enterprise Communications Server Release 5 System Description Pocket Reference* for capacity information.

Each Integrated Announcement circuit pack has 16 ports, and can play up to 16 simultaneous announcements. The system can connect multiple users to each of these announcements.

Any announcement stored on a circuit pack can play through any port on the circuit pack. Any announcement (not administered for "barge-in") can play simultaneously through multiple ports. All 16 ports could play the same announcement at the same time.

You must set the *Q* field to *y* (on the Announcements/Audio Sources form) for each extension that you want to queue for integrated announcements. Calls to hear integrated announcements at extensions that have queue assigned only queue when all 16 ports (on the circuit pack that contains the announcement) are busy. The same queuing pool is used over all boards. The system controls the announcement queue length for integrated announcements, but you must set the queue length for analog or aux-trunk announcements.

## Single integrated announcement boards

When your switch has only one integrated announcement circuit pack, the circuit pack can be either a TN750, a TN750B, or a TN750C.

### You need to back up a TN750 or TN750B circuit pack

You need to back up a TN750 or TN750B in the following situations:

- Before someone removes a TN750 or TN750B from the switch
- Before someone shuts down power to the switch

In both situations, the system loses any announcements stored on the circuit pack. Therefore, you need to backup announcements stored on the TN750 or TN750B circuit packs to the Mass Storage System (MSS). When someone inserts

or resets a circuit pack, or when someone powers up the system, the system checks the circuit pack for announcements. If the system determines that there are no announcements on the circuit pack, it automatically restores the announcements from the MSS.

 **CAUTION:**

*The announcements from MSS that are automatically restored are the last announcement saved to MSS. If multiple circuit packs are used, MSS might not contain the announcement for the B or A circuit pack.*

### You do not need to back up a TN750C circuit pack

The TN750C circuit pack has on-board FLASH memory backup, which substantially reduces the time required for power-up restore and eliminates the need for a manual save of the circuit pack contents.

The system retains announcements on the TN750C circuit packs, even when someone removes the circuit pack or when the system loses power. Therefore, the TN750C does not require the save and restore procedure. However, you can still use the save and restore procedure to copy the contents of a TN750C to another circuit pack.

### Multiple integrated announcement circuit packs

Multiple Integrated Announcement circuit packs can be installed in G3si and G3r switches. However, only one of these circuits can be a TN750 or TN750B. Any additional circuit packs must be TN750C circuit packs.

 **CAUTION:**

*Do not copy announcements from a TN750C to a TN750 or TN750B. This action may corrupt the announcement data.*

### Compression rates

The system stores integrated announcements on a TN750A at a compression rate of 32 Kbps. The system can store integrated announcements at one of three compression rates on the TN750B and TN750C circuit packs. You administer the compression rate separately for each announcement extension. In this way, the system can store announcements with different compression rates on the same circuit pack. During playback, the switch sets the port to the correct compression rate for the announcement that it is playing.

- A 64-Kbps compression rate allows for 128 seconds of recorded announcement per circuit pack.
- A 32-Kbps compression rate allows for 256 seconds of recorded announcement per circuit pack. This is the default compression rate.

## 4 Basic Features

### *Recorded Announcement*

Page 4-506

- A 16-Kbps compression rate allows for 512 seconds of recorded announcement per circuit pack. The 16-Kbps rate does not provide a high-quality recording. It is not recommended for customer announcements, but is adequate for VDN of Origin announcements.

## End-user procedures

End users record, play back, or delete integrated announcements by initiating an announcement session. However, these end users must have console permissions assigned to their Class of Service (COS) for the internal station or Remote Access barrier code in order to initiate an announcement session.

Announcement sessions always use port 0 on the integrated announcement circuit pack. To begin an announcement session, the user must dial the administered feature access code (FAC) followed by the announcement extension. If an announcement session is already in progress, or if a save or restore command is in progress, the user hears reorder tone (fast busy) and the system drops the call.

If port 0 is in use, the user hears reorder tone followed by silence. This indicates that the port will be reserved for an announcement session. The user should redial the FAC and extension every 45 seconds to gain access to the port.

Once an end user accesses an announcement session, the user can dial "1" to record an announcement, "2" to play an announcement, or "3" to delete an announcement. If the circuit pack memory is more than 90% full, the system gives stutter dial tone when the user gains access to an announcement session. Even if the user hears stutter tone, the user should begin speaking to record the announcement.

### **Begin the recording**

If the system user dials a "1", the switch attempts to start a recording session. If an announcement already exists and is protected (designated as protect=y), the user hears intercept tone. If the announcement is currently being played to callers, the user hears reorder tone. If the system is starting the recording session, the user hears record tone and can begin recording.

### **End the recording**

When the recording is complete, dial "#" from a hybrid or digital telephone or hang up from an analog telephone. If you are using an analog telephone, ending with a "#" puts a tone in the message. If you are using an analog telephone that is not connected via lineside T1 (DS1 type), the system records a click when you hang up. After hanging up, you can record another announcement for this extension or rerecord the same announcement before 15 seconds but you must wait 15 seconds to record a different announcement. If the circuit pack memory becomes full during recording, you will hear a reorder tone and the system drops you. The announcement is not retained.

## 4 Basic Features

### *Recorded Announcement*

Page 4-507

After you have completed a recording and hung up, do not immediately dial the extension. The announcement just recorded remains busy for approximately 15 seconds. The announcement just recorded can be played back by dialing the announcement feature access code, then the announcement extension, then "2" before the 15 second timer expires.

### **Play back the recording**

Upon completion of the recording session (drop), the system sets a 15-second timer. During this interval, the system restricts the user to one of two tasks: to listen to the announcement just recorded or to record another announcement.

If the user wants to listen to the announcement before it is available to others, the user dials the FAC, the extension, and "2." The system plays the announcement and then generates dial tone. The user can then perform another operation, such as record a message.

### **Delete the recording**

If the user dials "3", the system deletes the announcement and the user hears confirmation tone. If the announcement is protected or is currently being played, the system does not delete the announcement and the user hears reorder tone.

## **Interactions**

---

- **Automatic Call Distribution (ACD)**

Recorded announcements are used extensively for ACD, Call Vectoring, Call Prompting, Expert Agent Selection, VDN of Origin Announcement, Direct Department Calling, and UCD features. See the individual features for interaction details.

- **Automatic Wakeup**

Recorded Announcement allows Automatic Wakeup to use the built-in TN750B or later-suffix announcement circuit pack, in place of the Audichron adjunct.

If you use an integrated, multiple-integrated, or external type of announcement for Automatic Wakeup, you can also administer the announcement to repeat and to allow "barge-in" as a queue type. The benefit of repeating announcements and "barge-in" queues is that you do not need a separate port for each wakeup announcement. When guests go off-hook to receive an announcement at a particular time, they use only one port and the message repeats on the port until the last guest goes off-hook and the message ends.

## Recorded Telephone Dictation Access

Recorded Telephone Dictation Access permits voice-terminal users, including Remote Access and incoming tie-trunk users, to access dictation equipment.

Users start by dialing an access code or extension. Start/stop is controlled by voice or dialing. Initial activation and playback are controlled by dial codes.

### How to administer Recorded Telephone Dictation Access

#### Required forms

| <u>Form</u>         | <u>Field</u> | <u>Page</u>           |
|---------------------|--------------|-----------------------|
| CPE trunk group     | ■ All        | <a href="#">7-174</a> |
| 2500 Voice Terminal | ■ All        | <a href="#">6-47</a>  |

### Interactions

Recorded Telephone Dictation Access cannot be used with the following features:

- Automatic Route Selection
- Conference — Attendant
- Conference — Terminal

## Remote Access

---

Remote Access permits authorized callers from remote locations to access the system via the public network and then use its features and services.

Read the security information on [4-510](#) before administering this feature.

### SECURITY ALERT:

*Lucent Technologies has designed the Remote Access feature incorporated in this product that, when properly administered by the customer, enables the customer to minimize the ability of unauthorized persons to gain access to the network. It is the customer's responsibility to take the appropriate steps to properly implement the features, evaluate and administer the various restriction levels, protect access codes, and distribute them only to individuals who have been advised of the sensitive nature of the access information. Each authorized user should be instructed on the proper use and handling of access codes.*

*In rare instances, unauthorized individuals make connections to the telecommunications network through use of remote-access features. In such an event, applicable tariffs require that the customer pay all network charges for traffic. Lucent Technologies cannot be responsible for such charges, and does not make any allowance or give any credit for charges that result from unauthorized access.*

## Detailed description

---

Remote Access provides a caller with access to the system and its features from the public network. This allows an employee to make business calls from home or use Recorded Telephone Dictation Access to dictate a letter. Authorized users can also access system features from any on-site extension.

You can administer up to 10 barrier codes, each with a different COR and COS. Barrier codes can be from 4 to 7 digits, *but all codes must be the same length*. Barrier codes provide your system security and define calling privileges through the administered COR. You can also require that users enter an authorization code to use this feature. Both barrier codes and authorization codes are described under Security on [4-510](#).

Remote Access users can dial into the system using DID, CO, FX, or 800 Service trunks. When a call comes in on a trunk group dedicated to Remote Access, the system routes the call to the Remote Access extension that you have assigned. If DID is provided and the Remote Access extension is within the range of numbers that can be accessed by DID, Remote Access is accessed through DID.

Upon access to the feature, the user hears system dial tone. If you have administered your system to require a barrier code or authorization code, the system requires the user to enter it now. If the user enters the required codes, the system generates dial tone. The user can now place local or long-distance calls as allowed.

The destination of incoming non-DID trunk calls can be an attendant or an extension. The destination is specified on each individual trunk group. When the trunk group is dedicated to Remote Access, the Remote Access extension is specified. In this case, the user does all dialing. If an attendant is needed on a call, the user dials the public network telephone number assigned, the barrier code, and the attendant access code.

You can administer your system to provide attendant-assisted calling during the day but Remote Access after normal business hours. You do this by setting the trunk group `Incoming Destination` field to **attd** (the attendant), and specifying the Remote Access extension as the Night Service extension.

## Security

---

The system provides the ability to check the status of the remote access feature and barrier codes. The **status remote-access** command displays information that can help in determining why and when use of Remote Access or a particular barrier code was denied. The display indicates if Remote Access is:

- Not administered
- Enabled

- Disabled
- Disabled following detection of a security violation

It also gives the date and time that Remote Access was last modified.

For each barrier code, the command displays:

- Date the code was administered, reactivated, or modified
- Expiration date
- Number of calls that can be placed with the code
- Number of calls that have been placed using the code
- Whether the code is active or expired
- Date and reason a code expired

For a detailed description of the status remote-access command and display, see the *BCS Products Security Handbook*.

## Barrier Codes

Remote Access has inherent risks; it can lead to large-scale unauthorized long-distance use. To increase your system's security, use a 7-digit barrier code with Remote Access Barrier Code Aging. You can administer the Remote Access Barrier Code Aging feature to:

- Limit the length of time an access code remains valid
- Limit the number of times an access code can be used
- Both of the above

A barrier code automatically expires if an expiration date or number of accesses has exceeded the limits you set. If both a time interval and access limits are administered for a barrier code, the barrier code expires when one of the conditions is satisfied.

You must administer expiration dates and access limits for each of the possible 10 barrier codes. If your system has more than 10 Remote Access users, they must share codes.

When you no longer need a barrier code, remove it from the system. Barrier codes should be safeguarded both by you and their users.

If barrier codes are administered, a special answer-back tone causes a calling modem to leave dial mode. A modem's dialer is sometimes used to gain access (this tone also cancels echo suppressors in the network, preventing DTMF tones from breaking dial tone from a switch). Barrier codes can be used alone or with authorization codes.

Use the status remote-access command to view the status of a Remote Access barrier code.

 **NOTE:**

Barrier codes are *not* tracked by Call Detail Recording (CDR). Barrier codes are incoming access codes, whereas, authorization codes are primarily outgoing access codes.

## Authorization Codes

You can also administer authorization codes to manage access to your system. You can then use CDR to track code use. Use these guidelines to manage your system's authorization codes.

- Assigning codes — Create random codes; do not allow them to follow a predictable pattern. Use the maximum code length allowed and assign a unique code to each person responsible for protecting the code.
- Changing codes — Change codes often.
- Deleting codes — Delete codes when they are no longer needed.
- Monitoring use — Use CDR reports to analyze code use.

## Alternate Facility Restriction Levels

Consider changing FRLs with AFRL after normal business hours to restrict where calls can be made over your facilities. Take care, however, not to restrict callers from summoning emergency services after hours.

## Class of Restriction

The COR of an authorization code supersedes that of a barrier code.

- Time of Day Routing — Controlled by the time-of-day entries in COR or by the partition.
- Toll Restriction and Analysis — Controlled by COR.
- Trunk Access Code — Interacts with toll restriction. You can translate your switch so that users can make toll calls via Alternate Route Selection (ARS) without using a trunk access code.
- Trunk Administration — Remote Access trunks can be restricted.

See the *BCS Products Security Handbook* for additional steps to secure your system and to find out about obtaining security information on a regular basis.

## Logoff Notification

Use Logoff Notification when Remote Access is enabled, but not actively used. Logoff Notification notifies you at logoff that Remote Access is enabled. It guards against inadvertently leaving Remote Access active and can also alert you to unauthorized feature activation. Logoff Notification is administered by login ID.

## End-user procedures

Users can access the system, group, and enhanced Abbreviated Dialing lists via the remote-access trunk. To set up an Abbreviated Dialing list on a remote-access trunk, complete the following steps:

1. Set up the Abbreviated Dialing list on the Console form.
2. Administer the Abbreviated Dialing list entries.
3. Dial into the system over the remote-access trunk.
4. If a barrier code and authorization code are administered, dial them.
5. Dial the feature access code followed by the dial code of the list entry.

## Considerations

- Ringback Queuing and Automatic Callback cannot be used on a Remote Access call since the system does not have access to the calling (outside) number.
- Any feature requiring recall dial tone (for example, Hold and Transfer) cannot be accessed remotely.
- The Remote Access caller must use a touch-tone voice terminal, or equivalent.
- After a DTDM's baud rate is changed from 9600 to 1200, the DTDM cannot be accessed by Remote Access until an internal call is made to the DTDM.

## Interactions

- Authorization Codes  
When a Remote Access caller dials the assigned Remote Access extension and connects to the system, the system may request the caller to dial an authorization code in addition to a barrier code. Dial Tone between the barrier code and authorization code is optional. Calling privileges associated with the COR assigned to the authorization code supersede those assigned to the barrier code.
- Class of Restriction  
COR restrictions do not block access to the Remote Access feature.

- Integrated Services Digital Network Primary Rate Interface

A problem may exist when attempting to make a Remote Access call via a public and private trunk. For example, a caller dials 957-5730. The caller receives the beep-beep tones for Remote Access, and dials the barrier code. At this point, the caller may still hear the system dial tone, indicating that the digits are *not* being received by PBX#1. To correct the problem, change the UDP table on PBX#2 to give the extension its own RNX of 555.

- Night Service

The Remote Access extension can be specified as the Night Service extension on an incoming, non-DID, trunk group.

## Restricted/Unrestricted Call Lists

---

Restricted/Unrestricted Call Lists controls outgoing call access.

### How to administer Restricted/Unrestricted Call Lists

---

#### Required forms

---

| Form                 | Field           | Page                  |
|----------------------|-----------------|-----------------------|
| Toll Analysis        | ■ Dialed String | <a href="#">5-299</a> |
|                      | ■ Min/Max       |                       |
|                      | ■ RCL           |                       |
|                      | ■ UCL (1-10)    |                       |
| Class of Restriction | ■ RCL           | <a href="#">5-72</a>  |
|                      | ■ UCL (1-10)    |                       |

---

#### Detailed description

---

DEFINITY ECS uses call lists to complete or deny outgoing calls. There can be one restricted call list (RCL) and up to 10 unrestricted call lists (UCL). The Class of Restriction (COR) is assigned to the calling facility. It is checked against the RCL and UCLs.

UCLs are checked when:

- COR is "all-toll" or "tac-toll"
- COR UCL field references one or more UCLs

The call completes if the COR is associated with a UCL whose dialed string matches the dialed number and the COR is not associated with the RCL.

The call is denied if the COR is associated with the RCL and the dialed string matches a RCL dialed string. The caller receives intercept treatment. The RCL takes precedence over the UCL.

The following Authorization Check Flowchart depicts the order of call-processing functions that occur as a result of user dialed numbers and associated entries on the Toll Analysis form and the caller's COR form.

#### 4 Basic Features

##### *Restricted/Unrestricted Call Lists*

Page 4-516

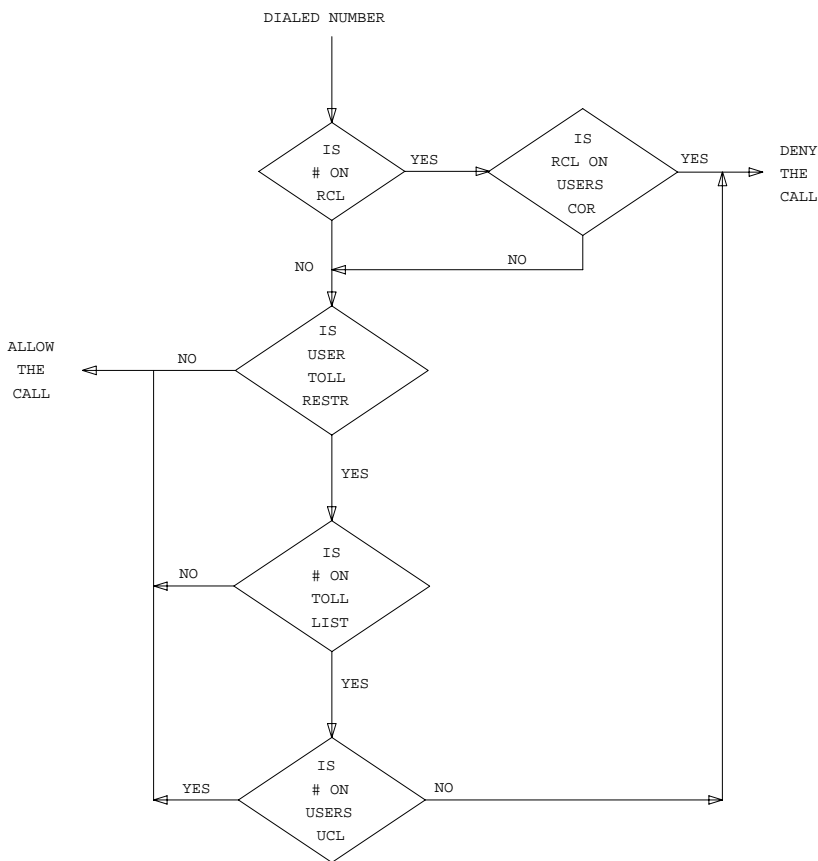

Checks are made as follows:

1. The first check determines if the dialed string is associated with the `RCL` (Restricted Call List) on the Toll Analysis form. If it is, the `RCL` field on the COR form associated with the caller's station is checked. If the field is `y`, the call is denied; otherwise, checking continues.
2. The next check determines if the `Calling Party Restriction` field on the COR form is **all-toll** or **tac-toll**. If it is, checking continues; otherwise the call is allowed.
3. The next check determines if the dialed string is associated with the `Toll List` on the Toll Analysis form. If it is, checking continues; otherwise, the call is allowed.
4. The next check determines if the dialed string is associated with a Unrestricted Call List number on the Toll Analysis form. If it is, the COR form is checked to determine if the UCL number is entered on the `Unrestricted Call List` field on the form. If it is, the call is allowed; otherwise, the call is denied.

In summary, calls from facilities are processed based on the COR assigned the facility, the COR's association with the System's RCL, UCL, and Toll List, and the specific digits dialed.

4 Basic Features

Restricted/Unrestricted Call Lists

THIS FLOWCHART DOES NOT REFLECT ANY FEATURE INTERACTIONS THAT MIGHT TAKE PLACE, SUCH AS WITH AUTHORIZATION CODES

## Restriction — Controlled

---

Controlled Restrictions allow a voice-terminal user with console permission to activate or deactivate specific restrictions.

### How to administer Controlled Restrictions

---

#### Required forms

---

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Feature Access Code (FAC)         | ■ User Control Restrict Activation and Deactivation   | <a href="#">5-113</a> |
|                                   | ■ Group Control Restrict Activation and Deactivation  |                       |
| Feature-Related System Parameters | ■ Controlled Outward Restriction Intercept Treatment  | <a href="#">5-123</a> |
|                                   | ■ Controlled Termination Restriction (Do Not Disturb) |                       |
|                                   | ■ Controlled Station-to-Station Restriction           |                       |

---

### Detailed description

---

Use Controlled Restriction to administer the following restrictions:

- **Outward** — The voice terminal cannot place calls to the public network.
- **Total** — The voice terminal cannot place or receive calls. (Allowed calls include calls to a remote-access extension, terminating-trunk transmission tests, and Emergency Access to Attendant calls.)  
Direct Inward Dialing (DID) calls are routed to the attendant or a recorded announcement. All other calls receive intercept tone.
- **Termination** — The voice terminal cannot receive any calls. Incoming calls are routed to the attendant, are redirected via Call Coverage, or receive intercept treatment.
- **Station-to-Station** — The voice terminal cannot place or receive station-to-station calls.

To activate Controlled Restriction:

1. Dial the group or extension feature access code.

## 4 Basic Features

### Restriction — Controlled

Page 4-519

2. Dial the number for the type of restriction desired:
  - 1 for outward
  - 2 for total
  - 3 for termination
  - 4 for station-to-station
3. Dial the voice-terminal extension (Attendant Control — Extension) or the Class of Restriction (COR) for a group of voice terminals (Attendant Control — COR).

## Considerations

---

- All voice terminals with the same COR are affected by a group restriction. When a call is placed, both individual and group restrictions are checked.

## Interactions

---

- Call Coverage  
Controlled Restrictions are not checked for covering users.
- Call Forwarding  
Controlled Restrictions for the forwarded-to extension are checked when Call Forwarding All Calls is active.
- Class of Restriction  
COR is checked when a call is authorized.
- Priority Call  
If a station user or a Station-to-Station Restricted user activates priority calling before they dial another station, they receive intercept tone. They receive this tone whether you set `Controlled Station to Station Restriction` on the Feature-Related System Parameters form to **y** or to **n**.
- Uniform Call Distribution  
Calls dialed through the UDP are not restricted by Outward Restriction.

## Ringback Queuing

---

Ringback Queuing places outgoing calls in an ordered queue (first-in, first-out) when all trunks are busy. The voice-terminal user is automatically called back when a trunk becomes available.

### How to administer Ringback Queuing

---

#### Required forms

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Trunk Groups                      | ■ Queue Length                                       | <a href="#">7-115</a> |

#### NOTE:

Automatic Callback and Ringback Queuing share the same intervals, codes, and buttons.

### Detailed description

---

If a multiappearance voice-terminal user has an idle Automatic Callback button and tries to access an all-trunks-busy trunk group, Ringback Queuing is activated automatically. The lamp associated with the Automatic Callback button lights and confirmation tone is heard.

Ringback Queuing is automatic for a single-line voice terminal. After dialing is complete, the user hears confirmation tone if the queue is available. No action is required.

The callback call is automatically placed to the terminal when a trunk becomes available. When the user answers the callback call (designated by a 3-burst alerting signal), the original call automatically continues. Redialing is not required.

Queuing can be specified for any non-DCS outgoing-only trunk group, or for the outward direction of a non-DCS 2-way trunk group.

## Considerations

---

- Queuing can reduce the number of trunks required.
- A multiappearance voice terminal can have one callback call associated with each Automatic Callback button assigned to the terminal.
- A single-line voice terminal can have only one automatic-callback call waiting at a time.
- Queue requests are canceled when:
  - A trunk is not available within 30 minutes.
  - The user does not answer the callback call within the administered interval.
  - The voice terminal is busy when the callback call is attempted.
  - The user dials the Ringback Queuing cancellation code or presses the Automatic Callback button associated with the queued call.
- Incoming tie-trunk calls cannot queue on an outgoing trunk group. The system does not know the calling number and cannot originate the callback call.
- The system checks the busy/idle status of the trunk group just once. If all trunks are busy, the call queues, even if a trunk has become available by the time the caller has completed dialing. This occasionally results in the caller being called back immediately after receiving confirmation tone and going on-hook.
- A trunk may appear to be available, yet outgoing calls are queued. The trunk is not free, because it is reserved for a previous Automatic Callback request.

## Interactions

---

- Automatic Callback

If you provide Ringback Queuing, you must also provide Automatic Callback.
- Automatic Route Selection

If a multiappearance voice-terminal user has an Automatic Callback button, makes an ARS call, and all trunks are busy, Ringback Queuing is activated automatically.
- Bridged Call Appearance

Ringback Queuing is not provided on calls placed from a bridged call appearance.
- Call Coverage

Callback calls do not redirect, even if Send All Calls is active.

- Call Forwarding All Calls  
Callback calls are not forwarded.
- Call Pickup  
Callback calls cannot be picked up.
- Conference or Transfer  
A single-line voice terminal cannot receive a callback call while it has a call on hold. It can have only one active call at a time.
- Internal Automatic Answer  
Automatic calls generated by Ringback Queuing are not eligible for IAA.
- Remote Access  
Callback calls cannot be made to Remote Access users because the system does not know the calling number.

## Ringer Cutoff

Ringer Cutoff allows multiappearance voice-terminal users to turn audible ringing signals on and off. This feature does not affect visual alerting.

When this feature is enabled, only Priority ring (by default 3-burst), Redirect Notification, Intercom ring, and manual signaling ring at the voice terminal. Internal and external calls do not ring.

### How to administer Ringer Cutoff

#### Required forms

| Form                      | Field   | Page                 |
|---------------------------|---|----------------------|
| Station (multiappearance) | <ul style="list-style-type: none"> <li>■ Redirect Notification</li> <li>■ Button/Feature Button Assignments<br/>— ringer-off</li> </ul> | <a href="#">6-14</a> |

### Detailed description

The following table summarizes which calls are affected by Ringer Cutoff.

| Call Type                        | Redirect notification is |           |
|----------------------------------|--------------------------|-----------|
|                                  | Inactive                 | Active    |
| Voice terminal to voice terminal | no                       | ring ping |
| Attendant to voice terminal      | no                       | ring ping |
| Internal tie to voice terminal   | no                       | ring ping |
| APLT trunk to voice terminal     | no                       | ring ping |
| Trunk to voice terminal          | no                       | ring ping |
| Priority call to voice terminal  | yes                      | yes       |
| Intercom call to voice terminal  | yes                      | yes       |
| Manual signaling                 | yes                      | yes       |

#### NOTE:

If Call Coverage is set to Cover All and Ringer Cutoff and Redirect Notification are both active, then Redirect Notification is received. If Redirect Notification is not active, no audible alerting is received.

A user may not wish to be disturbed by the arrival of incoming calls, yet not want calls to be redirected immediately to coverage. For example, an executive may want a secretary to answer calls before they redirect to coverage. The bridging user (the secretary) is not affected by the executive's activation of Ringer Cutoff.

To activate Ringer Cutoff, the user presses the voice-terminal Ringer-Cutoff button. The associated status lamp lights. Ringing is silenced. If Ringer Cutoff is activated while the voice terminal is ringing with an internal or external call, the ringer is silenced.

To deactivate Ringer Cutoff, the user presses the Ringer-Cutoff button again. Ringing returns to audible. If the selected call is active, other incoming calls do not start ringing. If the selected call is in the ringing state, the ringer becomes audible.

## Considerations

---

- A multiappearance voice terminal may have just one Ringer Cutoff button.
- If a primary extension and all other users with bridged appearances of the primary extension activate Ringer Cutoff, an incoming call silently alerts all of the terminals and then redirects to coverage.

## Interactions

---

- Automatic Callback  
If Ringer Cutoff is active, an Automatic Callback call returns to the user's voice terminal with the normal 3-burst ring.
- Bridging  
A bridging user is not affected by a primary extension's activation of Ringer Cutoff. Nor is the primary extension affected by the bridging user's activation of Ringer Cutoff.
- Call Forwarding All Calls  
If Ringer Cutoff and Call Forwarding All Calls are active, the user receives redirect notification, if you set `Redirection Notification` to **y** for the extension.
- Distinctive Ringing  
Ringer Cutoff turns off only the distinctive ringing of internal and external calls. Intercom ringing, priority ringing, redirect notification, and manual signaling are not turned off.
- Intercom (Automatic and Dial)  
If Ringer Cutoff is active, intercom calls still ring the user's voice terminal.

- Manual Signaling  
If Ringer Cutoff is active, Manual Signaling still rings the user's voice terminal.
- Ringback Queuing  
If Ringer Cutoff is active, the return call for Ringback Queuing still rings the user's voice terminal with a 3-burst alerting signal.
- Priority Calling  
If Ringer Cutoff is active, priority calls still ring at the user's voice terminal.
- Send All Calls  
When Ringer Cutoff and Send All Calls are both active, the user receives redirect notification, when `Redirection Notification` is set to `y` for that extension.

## Ringling — Abbreviated and Delayed

---

Ringling — Abbreviated and Delayed allows you to assign one of four ring types to each call appearance on a voice terminal. Whatever treatment is assigned to a call appearance is automatically assigned to each of its bridged call appearances.

### How to administer Ringling — Abbreviated and Delayed

---

#### Required forms

---

| Form                              | Field  | Page                  |
|-----------------------------------|--|-----------------------|
| Feature-Related System Parameters | ■ Auto Abbreviated/Delayed Transition Interval (rings) | <a href="#">5-123</a> |
| Station                           | ■ Per Button Ring Control<br>■ Feature Buttons         | <a href="#">6-14</a>  |

---

### Detailed description

---

Ring types fall into two categories:

- Those that alert consistently and don't change:
  - Ringling, in which the lamp flashes and audible ringing occurs
  - Silent ringing, in which the lamp flashes and audible ringing does not occur
- Those that transition from one ringing state to another:
  - Abbreviated ringing, in which ringing continues for as many cycles as specified by the automatic abbreviated/delayed transition interval and then changes to silent alerting
  - Delayed ringing, in which visual alerting continues for as many cycles as specified by the automatic abbreviated/delayed transition interval and then changes to ringing

For a station with call appearances that have either abbreviated or delayed ringing, an abbreviated-ring button associated with that station's extension can be assigned on a different station. When one of those call appearances is being alerted, pressing the button forces immediate transition of the alerting — that is, from ringing to silence or from silence to ringing.

## 4 Basic Features

### *Ringling — Abbreviated and Delayed*

Page 4-527

This feature is most useful in bridging situations in which some users want to be:

- Audibly alerted to a call immediately upon its arrival
- Audibly notified if the call has not been answered within a specified number of rings or if they have indicated.
- Able to stop the audible alerting if the call is not being answered by the principal and the user is not able to answer the call.

Because ring type can be specified on a per-station basis, mixing ring-type specifications within a station's access to a particular extension is possible.

For Ringling — Abbreviated and Delayed, each call appearance must be:

- Assigned a ring type
- Administered to transition when the:
  - Abbreviated/delayed transition interval is reached or when the voice-terminal user presses the abbreviated ring button
  - Voice-terminal user presses the abbreviated ring button, regardless of the abbreviated/delayed transition interval

## Ring options

You assign one of the following ring types to each line button.

- Abbreviated Ring  
A call rings the terminal until the automatic or manual abbreviated/delayed transition occurs. Then the call silently alerts the terminal.
- Delayed Ring  
A call silently alerts the terminal until the automatic or manual abbreviated/delayed transition occurs. Then the call rings the terminal.
- No Ring  
A call silently alerts the terminal and does not transition.
- Ring  
A call rings the terminal and does not transition.

## End user operation

- You can administer Ringling — Abbreviated and Delayed to transition automatically and manually for each call appearance. Automatic transition does not require any user action. The transition occurs based on the administered abbreviated/delayed transition interval.
- Manual transition does require user action. Users press the abbreviated-ring button on their terminal. This action forces the abbreviated/delayed transition to occur for all calls at the administered extension. Calls to other extensions that alert the terminal are not affected.

## 4 Basic Features

### *Ringling — Abbreviated and Delayed*

Page 4-528

## **Considerations**

---

- You cannot assign Ringling — Abbreviated and Delayed to a system console.
- At any one time, a voice terminal can have separate calls visually alerting and audibly alerting.
- If you administer a call appearance for delayed or abbreviated ringling and do not administer the call appearance for automatic abbreviated/delayed transition, assign an abbreviated-ring button to the call appearance extension on that terminal for that call appearance's extension.
- You can assign Ringling — Abbreviated and Delayed to analog stations, whether they are administered as a primary call appearance or a bridged call appearance set. However, because analog stations cannot visually alert, a user may unexpectedly answer an incoming call while intending to originate a call.

## **Interactions**

---

When one of the following features attempts to alert a station, the ringling presented to the user is influenced by the ring-type translations specified for Ringling — Abbreviated and Delayed. Undesirable feature operation may result if these translations are set inappropriately. For example, a ring type of no ringling results in the station not being alerted audibly.

- Automatic Callback
- Automatic Call Distribution (ACD)/Hunting
- Automatic Circuit Assurance (ACA)
- Busy Verification of Terminals
- Consult
- Night Service (Unattended Console Service)
- Personal Central Office Line (PCOL)
- Priority Calling
- Ringback Queuing
- Security Violation Notification (SVN)
- Terminating Extension Group (TEG)
- Active Station Ringling

This feature determines when a station is audibly alerted. Active Station Ringling determines if the ring is to be permitted, shortened to a single ring cycle, or suppressed. Single ring timing begins when the call rings at each station that has access to the appearance. In this way, even though

## 4 Basic Features

### *Ringling — Abbreviated and Delayed*

Page 4-529

a call has been alerting other ringing or abbreviated-ringing stations for more than one ring cycle, the delayed-ringing stations have a full cycle of ring beginning at the abbreviated/delayed transition.

- Administration Without Hardware

It is possible to assign Ringling — Abbreviated and Delayed to stations administered without a specified port. When stations are associated with ports, these assignments become effective.

- Attendant Console

Ringling — Abbreviated and Delayed cannot be assigned to an attendant console.

- Call Coverage

If the number-of-rings interval for coverage is shorter than the automatic transition interval, a call redirects to coverage before audibly alerting a call appearance that has delayed ringing. However, timing continues for the automatic transition interval in case no coverage point is available and the call continues to alert at the station.

When a call is immediately redirected to coverage (because of Cover Active, Cover All, Cover Busy, or Send All Calls), the Ringling — Abbreviated and Delayed feature has no effect.

- Call Forwarding — Busy/Don't Answer

When a call is forwarded because it is not answered in the specified time, the call stops alerting the station and is not affected by the Ringling — Abbreviated and Delayed feature. However, timing continues for the automatic transition interval in case forwarding fails and the call continues to alert at the station.

If the call forward don't answer interval is shorter than the automatic transition interval, the call redirects to the forwarded-to extension before ringing a station with a ring type of delayed ringing.

- Call Vectoring — Expert Agent Selection — Logical Agents

Calls routed to a logical agent use the translations for the Ringling — Abbreviated and Delayed feature of the station being used by the agent.

- Data Extension Calls

Data Extension calls are not affected by the ring values, but continue to be directed by the bridged call alerting administration.

- Distinctive Alerting (Ringling)

The Ringling — Abbreviated and Delayed feature affects all audible alerting using the 1-, 2-, or 3-burst pattern.

- Hospitality Features — Do Not Disturb

The Do Not Disturb feature takes precedence over the Ringling — Abbreviated and Delayed feature in blocking ringing to the station.

## 4 Basic Features

### *Ring*ing — *Abbreviated and Delayed*

Page 4-530

- Integrated Services Digital Network — World Class Basic Rate Interface

Several of the protocol variations supported by the World Class BRI feature do not permit the messaging required for control of the station's ringer by Ringing — Abbreviated and Delayed. In this case, ring type is forced to a value of ring.

- Multiappearance Preselection and Preference

The system automatically selects any alerting call on a station whether or not it is ringing if the `Per Button Ring Control` field is set to **n**. If the field is set to **y**, it selects only audibly ringing calls.

- Off-Premises Station and Off-Premises Extension Lines

The ring type assigned to OPS and OPX lines are forced to a value of ring.

- PCOL Calls

PCOL calls are not affected by the ring values, but continue to be directed by the bridged call alerting administration.

- Redirection Notification

If Redirection Notification is enabled, terminals only receive redirection notification if the alerting button or the first call appearance has an assigned ring value of ring or abbreviated ring. Bridged terminals only receive redirection notification for a forwarded call if the `Per Button Ring Control` field is set to **y** and the call appearance has an assigned ring value of ring or abbreviated ring.

- Ringer Cutoff

Ringer Cutoff takes precedence over Ringing — Abbreviated and Delayed. Pressing the ringer cutoff button turns off audible alerting at all call appearances and bridged appearances on the terminal.

- Temporary Bridged Appearances

Temporary Bridged Appearances are not affected by the Ringing — Abbreviated and Delayed feature. They always silently alert a station.

- Terminating Extension Group Calls

TEG calls are not affected by the ring values, but continue to be directed by the bridged call alerting administration.

- Voice Mail Systems

Voice mail systems may look for ringing applied to a port to trigger call answer. Undesirable adjunct operation may result if ring-type translations are inappropriately set for ports serving these adjuncts.

## Security Violation Notification

---

Security Violation Notification (SVN) allows you to set security-related parameters and to receive notification when the limits that you have established are exceeded. You can run reports related to invalid access attempts. You can also disable a login ID or remote access authorization that is associated with a security violation.

When a security violation occurs, SVN notifies a designated referral point. This can be an attendant console, a display-equipped voice terminal, or a voice terminal without display for SVN referral calls with announcements.

The system monitors and reports on the following types of security violations:

- Login violations
- Remote access barrier code violations
- Authorization code violations
- Station security code violations

DEFINITY ECS provides the option to log a major alarm if a security violation occurs involving a Lucent Technologies services login ID. Lucent Technologies is responsible for retiring the alarm.

*DEFINITY ECS Release 6 System Monitoring and Reporting* provides more information on how to run reports, and respond to security violations.

### How to administer SVN

---

**Table 4-84. Required forms**

| Form                               | Field  | Page                  |

**Table 4-84. Required forms — Continued**

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Remote Access                     | ■ Disable Following A Security Violation?               | <a href="#">5-258</a> |
| Login Administration              | ■ Disable Following A Security Violation?               | <a href="#">2-7</a>   |
| Recorded Announcements (optional) | ■ All — one announcement for each type of referral call | <a href="#">5-26</a>  |

## Detailed description

To effectively monitor the security of your system, you need to know how often both valid and invalid attempts at system entry are normally made. Then you will know if the number of invalid attempts is unusually high. A significant increase in such attempts can mean the system is being compromised.

### NOTE:

It is recommended that you print and clear the security-violation measurement reports at least once a month. In a busy system, once a week is not too frequent.

## Security violation thresholds and notification

As an example, you may determine that during a forty-hour week, it's normal for users to submit about 1,000 valid barrier codes and 150 invalid barrier codes; that is, about 3.75 invalid barrier codes are submitted per hour.

With this information, you may decide to declare that a security violation occurs during any hour in which 8 invalid barrier codes are submitted. If you know that during an 8-hour period, about 30 invalid codes are submitted, you might set the threshold to count a security violation when 40 invalid codes are submitted within eight hours.

You can administer SVN to place a referral call to the location of your choice whenever the established thresholds are reached.

Invalid attempts accumulate at different rates in the various security arenas (login, authorization code, remote access, and station security code), depending on feature usage and the number of users on a server. For this reason, you administer thresholds separately for each type of violation.

## Sequence of events

The following is the sequence of events that occur when a SVN is enabled and a security violation is detected:

1. SVN parameters are exceeded (the number of invalid attempts permitted in a specified time interval is exceeded).
2. A SVN referral call (with announcements, if assigned) is placed to a designated point, and SVN provides an audit trail containing information about each attempt to access the switch.
3. SVN disables a login ID or Remote Access following the security violation.
4. The login ID or Remote Access remains disabled until re-enabled by an authorized login ID, with the correct permissions.

## Reporting

The system reports information about security violations in the following ways:

- **In real time** — you can use the **monitor security-violations** command to monitor security violations as they may be occurring. Enter this command, followed by the type of security violation you want to monitor (logins, remote-access, authorization-codes, or station-security-codes).
- **On an immediate basis** — when a security violation occurs, the system sends a priority call to a designated referral point (attendant console or voice terminal). Thus, there is some chance of apprehending the violator during the attempted violation.

Upon notification, you can request the Security Violations Status Reports, which show details of the last sixteen security violations of each type. The Barrier Code and Authorization Code reports also include the calling party number from which the attempt was made, where available.

- **On a historical basis** — the number of security violations of each type, as well as other security measurements, are collected and displayed in the Security Violations Summary and Detail reports. These reports show summary information since the counters were reset by the **clear measurements security-violations** command or since system initialization. They do not show all aspects of the individual security violations.

## SVN- halt buttons

You can administer buttons for the notification extension to stop notification calls. However, this may pose a security risk. Do not use these buttons if you do not really need them.

To find out what svn-halt buttons exist in the system, enter the command:

**display svn-button-location**

The SVN Button Locations screen appears.

```
-----

```

#### Screen 4-5. SVN Button Locations

### SVN Referral Call With Announcement

The SVN Referral Call with Announcement option has the capacity to provide a recorded message identifying the type of violation accompanying the SVN referral call. Using Call Forwarding, Call Coverage, or Call Vector Time-of-Day Routing (to route to an extension or a number off the switch), SVN referral calls with announcements can terminate to a point on or off the switch.

Use of other means to route SVN referral calls to alternate destinations are not supported at this time. An attempt to use an alternate method to route SVN referral calls may result in a failure to receive the call or to hear the announcement.

### Dealing with security violations

When a security violation has occurred, there are steps that you can take to ensure that this same attempt is not successful in the future.

## Enable/disable a login ID

The Login Administration form `Disable Following a Security Violation` field is used to set the SVN parameters for a single login. When set to **y**, SVN disables the specified login ID if it is involved in a security violation. The `Disable a Login ID Following a Security Violation` field is dynamic and only appears when the login component of SVN is enabled.

To enable a login ID that has been disabled by a security violation, or disabled manually with the command **disable login**:

1. Log in to the switch using a login ID with the correct permissions.
2. Enter the command **enable login <login ID>**.

To disable a login ID:

1. Log in to the switch using a login ID with the correct permissions.
2. Enter the command **disable login <login ID>**.

## List the status of a login ID

To list the status of a login ID:

1. Log in to the switch using a login ID with the correct permissions.
2. Enter the command **list login**.

You see a display indicating the status of the specified login ID. A login ID status can be listed as:

- Disabled — The login ID was disabled manually using the **disable login** command.
- Svn-disabled — A security violation was detected for that login ID and the login was disabled by the SVN feature.
- Active — The login ID is currently logged in.
- Inactive — The login ID is not logged in.

## Enable/disable Remote Access

The Remote Access form `Disable Following a Security Violation` field is used to set the SVN parameters for Remote Access on a system-wide basis. When set to **y**, SVN disables Remote Access for the entire system if a remote access security violation occurs. The `Disable Following a Security Violation` field is dynamic and only appears when the remote access component of SVN is enabled.

## 4 Basic Features

### Security Violation Notification

Page 4-536

To enable remote access that has been disabled following a security violation, or disabled manually with the command **disable remote access**:

1. Log in to the switch using a login ID with the correct permissions.
2. Enter the command **enable remote-access**.

To disable Remote Access:

1. Log in to the switch using a login ID with the correct permissions.
2. Enter the command **disable remote-access**.

## View the status of Remote Access

You can check the status of remote access and barrier codes.

To list the status of a login ID:

1. Log in to the switch using a login ID with the correct permissions.
2. Enter the command **status remote-access[print]**.

This command shows whether remote access is enabled or disabled, the existing barrier codes, their expiration dates, and their status. See [“Remote Access” on page 5-258](#) for more information.

## Considerations

---

- You may only administer one referral destination per system for each type of violation.
- Exercise caution when administering bridged appearances for stations that are used as SVN referral destinations. SVN referral calls terminating to bridged appearances *must* be accompanied by an announcement message or *must* route to bridge appearances equipped with a display module. SVN referral calls that do not have an announcement and terminate to a bridged appearance not having a display will not provide an indication of the nature of the call.
- An authorization code violation with remote access generates two SVNs -- one displaying “authorization code violation” and one displaying “barrier code violation,” even though the correct barrier code was input. These two displays help you determine that the violation took place in the context of a remote access attempt, not an attempt to place an outgoing call to an ARS trunk.

## **Interactions**

---

- **Call Coverage, Call Forwarding, and Call Pickup**  
These features are supported for SVN only if you use recorded announcements.
- **Centralized Attendant Services**  
CAS attendants cannot receive referral calls from branch locations.
- **DCS**  
SVN does not support referral calls across a DCS network.
- **Priority Calling**  
All SVN referral calls are priority calls.

## Send All Calls

---

Send All Calls allows users to temporarily direct all incoming calls to coverage regardless of the assigned call-coverage redirection criteria. Covering users can temporarily remove their voice terminals from the coverage path.

### How to administer Send All Calls

---

#### Required forms

---

| Form                      | Field  | Page                  |
|---------------------------|--|-----------------------|
| Feature Access Code (FAC) | ■ Send All Calls Activation and Deactivation     | <a href="#">5-113</a> |
| Station (multiappearance) | ■ Button/Feature Button Assignments — send-calls | <a href="#">6-14</a>  |
| Coverage Path             | ■ DND/SAC/Goto Cover                             | <a href="#">5-94</a>  |

### Interactions

---

- Automatic Call Distribution  
With Send All Calls active, an ACD agent is still available for ACD calls.
- Automatic Callback  
Send All Calls does not work with Automatic Callback calls.
- Call Coverage  
Refer to Call Coverage in this document to learn about that feature and its impact on Send All Calls.
- Direct Department Calling/Uniform Call Distribution  
With Send All Calls active, a member of a DDC/UCD hunt group is not available for calls.
- Internal Automatic Answer  
IAA does not apply to calls to the original called extension when that extension has Send All Calls active.
- Night Service  
With the console in Night Service and Send All Calls active, a call covers after the “no answer” ring interval.

## Service Observing

---

Service Observing allows a specified user, such as a supervisor, to observe or monitor another user's calls. In this section, "observer" refers to the supervisor who is observing calls. "Agent" refers to the terminal, attendant, or logical agent being observed. A vector directory number (VDN) call can also be observed. Observers can observe in listen-only or listen-and-talk mode.

Note that you set up Service Observing to observe a particular extension, not all calls to all extensions at a terminal.

 **NOTE:**

Service Observing may be subject to federal, state, or local laws, rules, or regulations or require the consent of one or both of the call parties. Familiarize yourself and comply with all applicable laws, rules, and regulations before using this feature.

### How to administer Service Observing

---

#### Required forms

---

|                                   | ■ Service Observing Listen/Talk Access Code (remote/by FAC, VDN, Logical Agent ID) |                       |

- Class of Restriction form
  - On the agent's COR form, set `Can Be Service Observed` to **yes** to allow the extension to be observed.
  - On the observer's COR form, set `Can Be Service Observer` to **yes** to allow the extension owner to observe others' extensions.
  - On the observer's COR form, grant permission to observe specific CORs. On the Service Observing COR table, enter **y** next to the CORs to be observed.

**Detailed description**

To begin observing, the observer presses the Service Observing button plus the agent's extension number. Initially, the observer is in listen-only mode. The observer presses the Service Observing button to toggle between listen-only and listen/talk mode. The lamp indicates which mode the observer is in.

To deactivate Service Observing, the observer hangs up, selects another call appearance, or presses the disconnect or release button.

An observer can observe an agent who is not active on a call. The observer is in the wait state until the agent receives a call, then the observer is bridged onto the call.

You can administer a warning tone on each system to let agents and callers know when someone is observing a call. Before connection, the conference tone may add 2-3 seconds delay if enabled. The parties hear a 2-second, 440-Hz warning tone before an observer connects to a call, followed by a half-second burst of this tone every 12 seconds during observation.

### **Observing logical-agent IDs**

With EAS, an observer can observe agents based on their logical-agent ID rather than their physical voice terminal. The observer enters the logical-agent ID extension number of an agent, who must be logged in to a voice terminal. The observer can monitor every ACD, personal, and Direct Agent call delivered to or placed by the agent, including calls placed to the physical extension.

Only one observer can observe a physical terminal at one time. An observer cannot observe a logical agent ID extension at a physical terminal that is already being observed. Likewise, an observer cannot observe a physical extension that is being observed as a logical-agent ID extension.

### **Observing VDNs**

To observe a VDN, the observer enters a specific VDN extension and bridges onto calls (one call at a time) that have started vector processing for that VDN. The observer hears all tones, call prompting, caller dialing, announcements, music, and speech that the agent and caller hear. If an observer is in a COR administered to hear VDN of Origin announcements and has a VOA Repeat button, he or she can hear and replay VDN of Origin announcements.

The observer sees the name of the VDN, agent, or trunk as each is accessed in sequence by the VDN. For example, during vector processing the VDN name is displayed, but when the call connects to an agent, the agent name is displayed.

When the observer connects to a call in vector processing, the system maintains the connection until the call is disconnected or the observer hangs up, even if the call is routed or transferred externally. If the observer does not disconnect after one observed call is disconnected, the observer is connected to another call on the same VDN. Observing is listen-only as long as the call is in vector processing. Once the call is out of vector processing, an observer with listen/talk capability can talk as well as listen.

### **Observing remotely or by FAC**

Observers can observe calls from a remote location or local terminal using Service Observing FACs. When observing remotely, observers must use FACs. Different FACs are required for listen-only and listen/talk modes. When observing locally or remotely by FAC, the observer cannot toggle between modes. Physical extensions, logical-agent ID extensions, and VDNs can be observed remotely.

Remote observing is initiated through Remote Access or Call Vectoring.

- With Remote Access, an observer accesses a switch via a trunk group dedicated to Remote Access or via a DID to the Remote Access extension. Remote observing works with all types of DID trunks, including ISDN-PRI and tie trunks, and DCS over analog, T1, or PRI.
- With Call Vectoring, an observer accesses a switch by dialing a VDN extension or a central office (CO) trunk that has a VDN extension as its incoming destination. Using route-to commands, you can design a Service Observing vector to allow a VDN call to directly access a specific extension to be observed or a Service Observing dial tone. At the dial tone, observers can enter any extension that they are authorized to observe. The following is a simple example of a Service Observing vector.

```

1.wait-time 0 seconds hearing ringing
2.collect 5 digits announcement 2300
  ("please dial your 5- digit security code")
3.goto step 5 if digits = 12345
4.disconnect after announcement 2000
5.collect 1 digits announcement 2310
  ("enter 1 to observe sales, 2 to observe billing")
6.route-to number 113001 with cov n if digit = 1
  (11=listen-only observe, 3001="Sales" VDN)
7.route-to number 113002 with cov n if digit = 2
  (11=listen-only observe, 3002="Billing" VDN)
8.goto step 5 if unconditionally
    
```

You can combine Call Prompting and Call Vectoring to provide security and to limit observation. See *DEFINITY Enterprise Communications Server Call Vectoring/EAS Guide* for information about creating a Service Observing vector.

## Service Observing indicators

[Table 4-85](#) shows general Service Observing indicators that observers receive.

**Table 4-85. General Indications to Observer**

| Condition               | Button Lamp        | Tone   |
|-------------------------|--------------------|--|
| Not active              | Dark               | None   |
| Denied activation       | Broken flutter     | Intercept/busy/reorder                                       |
| Activated               | Steady/Winking     | Confirmation tone followed by silence or connection to call. |
| Observing (listen only) | Steady             | Hear call  |
| Observing (listen/talk) | Winking            | Hear/talk on call  |
| In wait state           | Flash              | None   |
| Denied observing        | Flash (wait state) | Silence/ineligible tone followed by silence                  |

Table 4-86 through Table 4-88 show the indicators that observers receive when they activate and use Service Observing. In these tables:

- Wait state means that the observer has activated Service Observing but there are no calls or a call cannot be observed. A call appearance is not reserved. The observer must have an idle call appearance available to be used by Service Observing when an observable call comes in.
- Ineligible tone is heard when an observed call becomes ineligible for observation. See [“Considerations” on page 4-547](#) for conditions that make a call ineligible. This tone is the “hold confirmation tone”— a rapid series of 5 short 440-Hz beeps. The observer does not hear this tone if the agent receiving the ineligible call hears zip tone.

**Table 4-86. Feedback When Activation Denied**

| Condition                                       | State  | Lamp           | Tone      |
|---|--------|----------------|-----------|
| No such extension                               | denied | broken flutter | intercept |
| Extension not observable                        | denied | broken flutter | intercept |
| Not allowed COR <sup>1</sup>                    | denied | broken flutter | intercept |
| Extension has Data Restriction                  | denied | broken flutter | intercept |
| Extension has Exclusion Active                  | denied | broken flutter | busy      |
| Extension has Data Privacy Active on call       | denied | broken flutter | busy      |
| Extension already observed                      | denied | broken flutter | busy      |
| Extension is an observer                        | denied | broken flutter | busy      |
| Extension being busy-verified                   | denied | broken flutter | reorder   |
| Extension has a 6-party conference              | denied | broken flutter | reorder   |
| COR doesn't allow SO activation                 | denied | broken flutter | intercept |
| Observe VDN not optioned                        | denied | broken flutter | intercept |
| Logical ID not logged In                        | denied | broken flutter | busy      |
| Activation to logical with physical observed    | denied | broken flutter | busy      |
| Activation to physical with logical ID observed | denied | broken flutter | busy      |
| Maximum VDNs being observed                     | denied | broken flutter | reorder   |

1. Extension COR cannot be observed or COR for observer calling permission does not allow observing the COR of extension to be observed.

**Table 4-87. Feedback When Activation Allowed — At Time of Activation**

| Condition                       | State      | Lamp               | Tone  |
|---------------------------------|------------|--------------------|---|
| Active-eligible call            | observing  | steady/<br>winking | confirmation tone followed by<br>connection to call |
| No active call                  | wait state | flash              | confirmation tone followed by<br>silence            |
| Call ineligible                 | wait state | flash              | confirmation tone followed by<br>silence            |
| Call has "No Observe" COR       | wait state | flash              | confirmation tone followed by<br>silence            |
| VDN call already being observed | wait state | flash              | silence   |

**Table 4-88. Feedback When Activation Allowed — After Observe Activated**

| Condition  | State          | Lamp    | Tone              |
|--|----------------|---------|-------------------|
| No active/eligible Call                          | wait state     | flash   | silence           |
| Call in 6-party conference                       | wait state     | flash   | silence           |
| Call already being observed                      | wait state     | flash   | silence           |
| Call is being busy-verified                      | wait state     | flash   | silence           |
| Call has Data Privacy active                     | wait state     | flash   | silence           |
| Call has Data Restriction                        | wait state     | flash   | silence           |
| Call has Exclusion Active                        | wait state     | flash   | silence           |
| Active-eligible call (in listen-only mode)       | SO listen      | steady  | hear call         |
| Active-eligible call (in listen/talk mode)       | SO listen/talk | winking | hear/talk on call |
| Press button while observing in listen-only mode | SO listen/talk | winking | hear/talk on call |
| Observer presses Release                         | not observing  | dark    | none              |
| Call has "No Observe" COR                        | wait state     | flash   | silence           |

*Continued on next page*

**Table 4-88. Feedback When Activation Allowed — After Observe Activated**  
— *Continued*

| Condition  | State                 | Lamp               | Tone                                |
|--|-----------------------|--------------------|-------------------------------------|
| VDN call already being observed                              | wait state            | flash              | silence                             |
| No active eligible call                                      | wait state            | flash              | silence                             |
| Eligible VDN call  | observing             | steady/<br>winking | hear call                           |
| Eligible VDN call (in vector processing)                     | SO listen             | steady             | hear call                           |
| Eligible VDN call (out of vector processing in listen-only)  | SO listen             | steady             | hear call                           |
| Eligible VDN call (out of vector processing in listen/ talk) | SO listen/talk        | winking            | hear/talk on call                   |
| Press button while observing in vector processing            | SO listen             | steady             | no change to mode                   |
| Press button while not in vector and in listen-only          | SO listen/talk        | winking            | hear/talk on call                   |
| Call being observed becomes ineligible                       | wait state            | flash              | ineligible tone followed by silence |
| Active call disconnects                                      | wait state            | flash              | silence                             |
| Logical agent logs out                                       | denied                | broken flutter     | busy, then silence                  |
| Observer (without button) hangs up                           | deactivates observing | n/a                | n/a                                 |

While observing, the observer should press only the following buttons:

- Call Appearance
- Service Observing
- Position Busy
- Auto-ckt Assure
- Release (ACD)  
(This will end Service Observing)
- Bridged Appearance
- Auxiliary Work

- Queue Status (NQC, OQT, AQC, and AQT)
- System Night Service
- Hold (ignored)

## SECURITY ALERT:

### General security

Use the following COR restrictions to prevent unauthorized observing.

- For the observer, set `Can Be An Observer` on the COR form to **y**.
- For the agent to be observed, set `Can Be Observed` on the COR form to **y**.
- For the observer, grant permissions to all CORs to be observed on the Service Observing Permissions COR table.

### VDN-call security

Use the following COR restrictions for VDN-call observing.

- For the VDN extension to be observed, set `Can Be Observed` on the COR form to **y**.
- For the VDN destination, set `Can Be Observed` on the COR form to **y**.
- Enter the VDN extensions to be observed in the observer's Service Observing Permissions COR table.

### Vector-initiated security

Use the following guidelines for vector-initiated observing.

- Use Call prompting commands in Service Observing vectors to provide passcode protection and limit access to specific destinations or vector-verified, caller-entered digits.
- Use Time of Day/Day of Week checks in Service Observing vectors.
- Create a vector used exclusively for Service Observing.
- If you use route-to commands to observe a VDN extension, ensure the extension has an observable COR.
- If the observer is observing locally, grant calling permission to the observer on the VDN's COR.

In vector-initiated Service Observing, the COR assigned to the VDN used to initiate Service Observing, the COR assigned to the internal caller extension, and the COR assigned to agent to be observed are used to determine if Service Observing will be allowed. If the agent's COR is not observable, observation fails

regardless of the VDN or caller COR. When a call routes through multiple VDNs, the COR of the last VDN is used for calling/observing permissions regardless of VDN Override settings.

If you have administered the optional warning tone, the caller and the observer hear the tone only when the system connects the call to the answering or routed-to destination after vector processing is finished. The periodic tone is heard during the call even if the call is transferred off-switch. Use a warning announcement at the beginning of vector processing to inform the caller of observation since the system cannot give a warning tone until the call is out of vector processing.

## Remote-access security

Use the following guidelines for remote observing.

- Use Barrier Codes and Authorization Codes to limit the use of Remote Access to authorized users. See [“Remote Access” on page 4-509](#) for information about these codes and other Remote Access security measures.
- Use different Authorization Codes for different Service Observing permissions.
- Use Facility Restriction Levels (FRLs) and restrictions such as the Authorization Code COR to restrict Remote Access service observer access to other destinations (for example, stations or trunks).
- Use Call Prompting to create additional access security.

Assign the VDN, Barrier Code, and Authorization Code calling and Service Observing permissions and set Can Be Observer to yes on the associated COR form. The last COR encountered is used to determine observer permissions.

## Considerations

---

### Observability

Although an agent can be a member of multiple splits or skills, an agent can be observed by only one observer at a time. If two agents with different supervisors are observed and one agent calls the other, the originator's supervisor observes the call, and the other supervisor is placed in the wait state.

An attendant can be observed but *cannot* be an observer.

## Ineligibility

A call to an agent extension or VDN is ineligible for observing when the call:

- Is already being observed
- Is being busy-verified
- Has Data Privacy active
- Has Data Restriction active, is conferenced with an extension that has Data Restriction active, or is a VDN call that reached an extension that has Data Restriction active
- Has Privacy — Manual Exclusion active, is conferenced with an extension that has Privacy — Manual Exclusion active, or is a VDN call that reached an extension that has Privacy — Manual Exclusion active
- Is in a conference where adding the observer results in more than 6 parties (see [“Conferenced calls” on page 4-548](#) for more detail on conferences)
- Is a VDN-observed call that reaches an unobservable extension or VDN. (Note that the COR of the hunt group, split, or skill used to distribute the call to the station/agent is not checked. The CORs of stations/agents conferenced with the call are not checked.)

## Trunk calls

If an agent being observed makes an trunk-call, observation starts after the agent finishes dialing. For central office (CO) trunks, dialing is considered complete when answer supervision is returned or when answer supervision timeout occurs.

## Multiple observers

Multiple observers can observe a single VDN simultaneously, but only one observer is observing a given call to the VDN. There is no limit to the number of observers observing a single VDN as long as the total number of observers actively observing VDNs does not exceed 50.

## Conferenced calls

An observer cannot initiate a conference while observing.

If an observed agent conferences a call and the number of conferenced parties is less than 6, the observer is placed in the wait state until the call is connected. Then the observer observes the conference. In addition, the observer is bridged onto any call on which the agent becomes active before the conference is complete. When the conference is complete, the observer is again bridged onto that call.

If an observed agent conferences a call and the number of conferenced parties (including the observer) is 6, the conference is denied.

A call to an observed VDN cannot be monitored if the observer, caller, and other parties bridged onto the call constitutes more than 6 parties.

If a conference is being observed because an observed agent entered the conference, when the agent hangs up, the conference is no longer observed. If a conference is being observed because an observed VDN call entered the conference, observing continues until the call is routed to an unobservable destination.

Conference members are observed during a conference regardless of their COR setting.

If a VDN call being observed is conferenced to an agent call being observed, the VDN observer continues to observe and the agent observer goes into wait state. If two observers (of either VDN or agent calls) are conferenced to a call, the first observer conferenced-in continues to observe and the second observer goes into the wait state. VDN or agent call observers hear the ineligible tone before going into wait state.

The same rules apply when multiple observers monitor transferred calls.

## Transferred calls

Observers cannot initiate a transfer while observing.

If an agent being observed transfers a call, the observer is placed in wait state. The observer is bridged on after the transfer is complete.

A VDN observer continues to monitor the transferred call until it is transferred or routed to a unobservable destination.

## Interactions

---

- ASAI

A call to an observed VDN continues to be observed after it routes to an adjunct. A call can be routed to a Service Observing FAC by the adjunct routing command in the same way that it can be with the route-to command.

- Assist

A VDN observer continues to observe a call during an assist operation. The observer observes the caller on hold and the conference, when the agent conferences the assist call with the VDN call.

- BCMS

BCMS does not report on Service Observing. BCMS reports show normal measured-call and agent activity related to Service Observing calls. When a physical agent (non-EAS) is observed, the BCMS Report By Login ID shows the physical extension along with the login ID.

- Bridged appearances

If an observer observes agent extension 3082, the observer is bridged onto calls only to 3082. If the agent with extension 3082 has a bridged appearance for extension 3282, calls to extension 3282 are not observed. Although extensions 3082 and 3282 have a call appearance on the same terminal, the observer cannot observe both extensions at the same time.

- Busy-verification

An observer cannot observe an agent call that is bridged onto by busy-verification. Also, an agent's call that is being bridged onto by an observer cannot be busy-verified.

- Call Coverage/Call Pickup

An observer cannot observe a call answered by a covering agent or member of a pickup group until the called agent bridges onto the call. The observer continues observing a call to an observed VDN call if the call is routed to a destination that forwards the call (via Call Coverage, Call Forwarding, or Call Pickup).

- Call Park

An observer cannot park a call while observing the call. An observer observing a VDN continues observing after a call is parked.

- Call Waiting

A call cannot wait on a single-line voice terminal that is being observed.

- Call Work Codes/Integrated Directory

The observer does not hear agent dialing with these features because the digits are passed to the switch in S-channel messages.

- CMS

When an observer is bridged onto a VDN call, CMS is notified.

- Converse command

Converse-split extension ports can be observed as physical extensions. A call to an observed VDN continues to be observed if the call is answered by a VRU through the converse command.

- DCS

To observe stations on another node (a DCS station extension), you must set up remote-access service observing. A DCS station can only observe another node using remote service observing. Service observing displays are not supported across DCS.

- Dialed Number Identification Service  
Observing by VDN provides monitoring by DNIS since the VDNs represent the DNIS of the service dialed.
- Direct Agent Calling  
A Direct Agent call to a logical-agent ID is monitored by observing the Logical Agent not by monitoring the physical extension.
- Hold  
Observers cannot place calls on hold while observing.  
If an observed agent places a call on hold, the observer is put in wait state. A VDN observer continues to monitor the caller placed on hold.
- Leave Word Calling  
Parties on an observed call cannot use LWC.
- Look Ahead Interflow  
If an observed VDN call routes to another location via Look Ahead Interflow, the call continues to be observed. The observer hears a warning tone, if administered at the sending switch, when the call arrives at the receiving switch. The observer continues to hear the periodic tone while observing the VDN call.
- Move Agent/Change Skills  
Moves or changes of physical or logical agents being observed occur according to the move or change rules. Observing continues.
- Multiple Call Handling  
While an agent extension or logical ID is observed, only the active call is monitored. If all calls are put on hold, the observer hears silence.
- Music-on-Delay/Music-on-Hold  
If an observer is in listen/talk mode, neither caller nor observer hears music-on-hold. If an observer is in listen-only mode, the caller hears music-on-hold, but the observer does not. A VDN observer hears music provided to the caller.
- Night Service  
A VDN observer continues to observe when a call routes to night service.
- Recorded Announcement  
A VDN observer continues to monitor a call connected to an announcement. A Verify Announcement call placed by an observed physical or logical agent can also be observed.
- Redirection on No Answer  
A VDN observer continues observing a call after it is redirected or rings “in limbo”.

- Trunks without disconnect supervision

Service observing cannot be activated over no-disconnect-supervision trunks. The caller hears denial indication.

- VDN in a Coverage Path

Observers can observe calls that route to a VDN that is being observed or VDN calls that route to another VDN.

- VDN Return Destination

You can create a prompting VDN with a return destination assigned so that, if you activate observing and it fails or the denial indication times out, the prompting VDN allows you to retry activation. This is true only if the denial and disconnection occur after the call leaves vector processing.

If a vector step fails, the system proceeds to the next vector step. Disconnect or busy commands cause calls to be dropped and do not trigger return destination.

When return destination is triggered, the call is monitored through each return destination operation until the caller disconnects.

- Voice-terminal displays

Non-remote observers' voice-terminal displays mirror exactly what is displayed on the observed physical or logical agent's display. For example:

```
a="3035001234 to Sales SO"
```

While observing a VDN, an observer sees displayed the name of the VDN being observed while in vector processing. After the call leaves vector processing, the name of the agent or trunk group that the call is connected to is displayed.

- VuStats

Nonremote observers using 2-line displays can activate VuStats for an agent. An observer must activate VuStats before using Service Observing. The agent's statistics appear on the second line of the observer's display.

- Zip tone

VDN observers do not hear the zip tone that the answering agent hears.

## Single-Digit Dialing and Mixed Station Numbering

---

Single-Digit Dialing and Mixed Station Numbering allows easy guest access to internal hotel/motel services and provides the capability to associate room numbers with guest-room voice terminals.

### How to administer Single-Digit Dialing and Mixed Station Numbering

---

#### Required forms

| Form                              | Field                      | Page                  |
|-----------------------------------|----------------------------|-----------------------|
| Dial Plan Record                  | ■ All                      | <a href="#">5-99</a>  |
| Feature-Related System Parameters | ■ Short Interdigit Timeout | <a href="#">5-123</a> |

### Detailed description

---

You must create a dial plan for hotel/motel services and room numbers. Some suggestions follow.

- Assign a single-digit extension to internal hotel/motel services such as room service. Assign single-digit extensions to individual-voice terminals or to a group of voice terminals (for example, to service the front desk).
- Assign a prefixed extension to guest rooms.

A prefixed extension is made up of a prefix and an extension up to five digits. The prefix identifies the call type. The switch collects dialed digits, removes the prefix digit, and uses the extension for further processing.

- Mixed station numbering extensions can have from one to five digits and can begin with any digit from 0 to 9.

The first digit, in combination with the number of digits dialed, defines the call type. To differentiate between two numbers with the same leading digit but different lengths, the system monitors the interval after a digit is dialed and before the next digit is dialed. If the interval extends past the administered interdigit timeout, the system assumes that dialing is complete and calculates the number of digits dialed up to that point.

## Examples

Table 4-89. Sample Hotel/Motel Dial Plan 1

| First Digit | Length |     |     |      |      |   |
|-------------|--------|-----|-----|------|------|---|
|             | 1      | 2   | 3   | 4    | 5    | 6 |
| 1           |        | DAC |     |      |      |   |
| 2           | EXT    |     |     |      |      |   |
| 3           | EXT    |     |     |      |      |   |
| 4           | EXT    |     |     |      |      |   |
| 5           |        |     | EXT |      |      |   |
| 6           |        |     |     | PEXT |      |   |
| 7           |        |     |     |      | PEXT |   |
| 8           | DAC    |     |     |      |      |   |
| 9           | DAC    |     |     |      |      |   |
| 0           | ATTD   |     |     |      |      |   |
| *           |        | FAC |     |      |      |   |
| #           |        | FAC |     |      |      |   |

Dial plan 1 allows the following dial access:

- Single-digit access to three hotel/motel services (2, 3, and 4)
- Nonprefixed access to as many as 100 hotel/motel staff extensions (500 through 599)
- Ten dial-access codes (DACs) beginning with the digit 1 (10 through 19)
- Toll-call access via DAC 8
- Toll-call access via DAC 9
- Single-digit access to the hotel/motel attendant (0)
- 2-digit feature-access codes (FACs) [\* or # plus another digit]
- Guest room extensions for as many as 100 floors
  - Access to floors 1 through 9 (prefix digit 6 + [100 through 999])
  - Access to floors 10 through 99 (prefix digit 7 + [1000 through 9999])

Table 4-90. Sample Hotel/Motel Dial Plan 2

| First Digit | Length |     |     |   |   |   |
|-------------|--------|-----|-----|---|---|---|
|             | 1      | 2   | 3   | 4 | 5 | 6 |
| 1           | EXT    | EXT | EXT |   |   |   |
| 2           | EXT    | EXT | EXT |   |   |   |
| 3           | EXT    | EXT | EXT |   |   |   |
| 4           | EXT    | EXT | EXT |   |   |   |
| 5           | EXT    | EXT | EXT |   |   |   |
| 6           | EXT    | EXT | EXT |   |   |   |
| 7           | EXT    | EXT | EXT |   |   |   |
| 8           | DAC    |     |     |   |   |   |
| 9           | DAC    |     |     |   |   |   |
| 0           | ATTD   |     |     |   |   |   |
| *           |        | FAC |     |   |   |   |
| #           |        | FAC |     |   |   |   |
|             |        |     |     |   |   |   |

Dial plan 2 allows the following dial access:

- Single-digit access to the hotel/motel attendant (0)
- Single-digit access to seven hotel/motel services (1 through 7)
- Toll-calling access via DAC 8
- Toll-calling access via DAC 9
- 2-digit access to 60 hotel/motel services (10 through 70)
- 2-digit FACs (\* or # plus another digit)
- Guest-room extensions for floors 1 through 7 (100 through 799)

Cancel timeout intervals if the user dials # after dialing all required digits.

### Considerations

- Mixed Station Numbering allows guest room numbers and room extensions to be the same.
- You cannot assign prefixed extensions longer than five digits (including prefix) to intercom lists.

## 4 Basic Features

### *Single-Digit Dialing and Mixed Station Numbering*

Page 4-556

- A trunk access code (TAC) and an extension can share a first digit only if the extension is shorter than the TAC.
- Although extensions with the same first digit can have different lengths, data-channel extensions must have the maximum number of digits to avoid timeout problems for data calls that the switch automatically sets up, for example, via the Call Detail Recording (CDR) link.
- An extension and a FAC can share the same first digit only if the extension is longer as long as they are not used for Automatic Alternate Routing/Automatic Route Selection (AAR/ARS) faxes. These extensions work only within the switch; they do not work as remote uniform dialing plan (UDP) extensions.

## Interactions

- Attendant Display and Voice Terminal Display  
Prefixed extensions display without the prefix. The return call button causes the prefix to dial, even though it does not display.
- Property Management System (PMS)  
Remove prefixes before messages containing the extension are sent to the PMS.  
Five-digit extensions do not exchange with PMS until modifications are made to the PMS interface.
- Uniform Dial Plan  
The following limitations apply to a distributed communications system (DCS) environment:
  - Extensions that differ in length from the UDP do not distribute to other switches.
  - If the first two digits of an extension correspond to the floor number, floors cannot be serviced by more than one switch.

## Station Hunting

---

Station Hunting routes calls made to a busy station down a chain of stations until one is found that is not active.

### How to administer Station Hunting

---

#### Required forms

---

| Form          | Field                 | Page                 |
|---------------|-----------------------|----------------------|
| Coverage Path | ■ Hunt After Coverage | <a href="#">5-94</a> |
| Station       | ■ Hunt-to Station     | <a href="#">6-14</a> |

### Detailed description

---

To use Station Hunting, you create a station hunting chain that governs the order in which a call routes from one station to the next when the called station is busy. Each station in the chain links to only one subsequent station. However, any number of stations may link to one station.

The system updates the calling party's display with "h" when the system begins checking the station-hunting chain. Likewise, the system updates the display of the station that is hunted-to (the station that takes the call) with an "h."

Calls route through the chain as follows.

**Table 4-91. Station Hunting Characteristics**

| Condition   | Response                                 |
|---|--|
| Encounters an idle extension                                      | Rings extension                          |
| Encounters an active extension                                    | Routes to next extension in chain        |
| Encounters an extension with a blank hunt-to station field        | Returns busy tone if no station was idle |
| Encounters any station a second time                              | Returns busy tone                        |
| Has checked 30 stations in the chain, without finding an idle one | Returns busy tone                        |

There is no limit to the number of extensions that can be in a station-hunting chain.

## Station Hunting examples

In this example ([Table 4-92](#)), extension 2 is the called extension. Because extension 2 is busy, the system follows the station-hunting chain to find an idle extension. The system cannot find an idle extension so it returns busy tone to the caller. Note that the chain terminates with extension 5. This means that the system cannot route the call to extension 1 even though it is an idle extension in the chain.

**Table 4-92. Station-Hunting Chain — Example 1**

| Extension | State  | Rings on extension |
|-----------|--------|--------------------|
| 1         | Idle   | 2                  |
| 2         | Busy   | 3                  |
| 3         | Active | 4                  |
| 4         | Active | 5                  |
| 5         | Busy   |                    |

In this example ([Table 4-93](#)), extension 2 is the called extension. Because extension 2 is busy, the system follows the station-hunting chain to find an idle extension. The call is answered at extension 1.

**Table 4-93. Station-Hunting Chain — Example 2**

| Extension | State  | Rings on extension |
|-----------|--------|--------------------|
| 1         | Idle   | 2                  |
| 2         | Busy   | 3                  |
| 3         | Busy   | 4                  |
| 4         | Active | 5                  |
| 5         | Active | 1                  |

In this example ([Table 4-94](#)), extension 2 is the called extension. Because extension 2 is busy, the system follows the station-hunting chain to find an idle extension. The system encounters extension 3 a second time without finding an idle station. The system stops checking the station-hunting chain and returns busy tone to the caller. Notice that both extensions 5 and 2 link to extension 3.

**Table 4-94. Station-Hunting Chain — Example 3**

| Extension | State | Rings on extension |
|-----------|-------|--------------------|
| 1         | Idle  | 2                  |
| 2         | Busy  | 3                  |
| 3         | Busy  | 4                  |
| 4         | Busy  | 5                  |
| 5         | Busy  | 3                  |

### Administration commands

When you remove a station, the system attempts to maintain a station-hunting chain. Consider the following examples:

- Station 1 links to 2 and 2 links to 3. If you remove station 2, the system links 1 to 3.
- Station 1 links to 2. Station 2 does not link to another extension. If you remove station 2, 1 no longer links to another extension.

When you duplicate a station, the extension in the hunt-to station field is not copied into the duplicated station.

When you execute “list usage extension xxxxx,” the system displays all stations that contain the station’s extension as their hunt-to station.

### Interactions

Remember that the system checks the station-hunting chain only for idle and available extensions.

- Adjunct Switch Applications Interface  
 The system attempts Station Hunting when ASAI routes to an extension with a hunt-to station.
- Administration without Hardware  
 You can assign a hunt-to station to a station administered without hardware. It is treated as unavailable and skipped.
- Automatic Call Distribution  
 An agent extension can be part of a station-hunting chain. The system hunts the agent’s chain only when the call is made directly to the agent’s extension. Calls distributed through hunt groups to an ACD agent do not hunt the agent’s station-hunting chain. Calls made to an extension for logical agents do not hunt the agent’s station-hunting chain.

- Automatic Callback

The system does not hunt the chain of the called extension when the call is a callback-return call.

- Bridged Appearance

The system hunts the extension's station-hunting chain if the principal station has no call appearance at which the call can terminate, even though it may have available bridged appearances on other stations.

- Busy Verification

The system does not attempt Station Hunting for busy-verify calls.

- Call Coverage

Call Coverage has precedence over Station Hunting.

Station Hunting is applied to the final coverage point when the following conditions occur:

- The Call Coverage form's `Hunt After Coverage` field is `y`.
- The last coverage point is unavailable (busy or no answer).
- The last coverage point is an station with an assigned hunt-to station.
- No one in the coverage path answered the call.

Coverage — Don't Answer will cover the call after hunt if the call can terminate, but no one answers.

- Call Detail Recording

CDR records the called extension, not the answering extension.

- Call Forwarding

Call Forwarding has precedence over Station Hunting.

If an idle station has Call Forwarding active, the system forwards the call. If a busy station has Call Forwarding active, a call to the station forwards. If the forwarded-to station is busy, the call follows that forwarded-to station's hunting chain.

If the system finds Call Forwarding active at one of the stations in a station-hunting chain, it considers the station busy and bypasses it. The call goes to the next station in the chain.

- Call Park

The system does not attempt Station Hunting on callpark-return calls.

- Call Pickup

Call Pickup functions the same for calls terminating at a point in a station-hunting chain as it does for a regular calls.

- **Call Vectoring**

You cannot assign a Vector Directory Number as a hunt-to station.

If coverage is set to yes, calls to a vector with a route-to step that routes to a busy station follow the hunt-to chain of the busy station. If coverage is set to no, vector processing continues.
- **Call Waiting/Attendant Call Waiting**

Station Hunting has precedence over Call Waiting.

If a called extension has Call Waiting active, and the extension is already busy on a call, the system hunts the station-hunting chain. If the system cannot terminate the call to a member of the chain, then the call waits at the called extension.

If the system finds Call Waiting active at an extension in a station-hunting chain, it considers the extension busy and bypasses it.
- **Class of Restriction**

The system checks the COR of the called extension; it does not check the COR of the hunt-to stations in the chain.
- **Distributed Communications System**

Station Hunting is not a DCS feature. All members of a station-hunting chain must be on the same switch.
- **Extension Number Portability**

You cannot assign a remote ENP extension as a hunt-to station.
- **Hunting/Hunting Group**

You cannot assign a direct departmental calling or Uniform Call Distribution extension as a hunt-to station.
- **Intercom Call**

The system denies Station Hunting for intercom calls to a busy extension.
- **Leave Word Calling**

If a caller initiates Leave Word Calling (LWC), the LWC message is left at the called extension even if the system uses Station Hunting in an attempt to complete the call.
- **Multimedia**

Calls to multimedia endpoints must convert to voice before station hunting.
- **Night Service**

The system denies Station Hunting when a night service call is made to a busy night-console extension.

- **Outgoing Trunk Queueing**  
The system does not attempt Station Hunting for an OTQ callback-return call.
- **Personal Central Office Line**  
The system does not attempt Station Hunting for a PCOL call.
- **Personal Station Access**  
The system considers a station with PSA dissociated as busy and bypasses it in the station-hunting chain.
- **Priority Call**  
The system denies Station Hunting for priority calls.
- **Send All Calls**  
Station Hunting is blocked for an extension with Send All Calls active.
- **Tenant Partitioning**  
The system applies normal tenant restrictions to a call to the called extension. However, the system does not check tenant restrictions on hunt-to stations.
- **Terminal Translation Initialization**  
The system considers a station with TTI separation as busy and bypasses it in the station-hunting chain.
- **Terminating Extension Group**  
You cannot assign a TEG as a hunt-to station.
- **Uniform Dial Plan**  
You cannot assign a remote UDP extension as a hunt-to station.
- **Voice Terminal Restriction**  
The system applies proper intercept treatment to a restricted, called extension. However, the system does not check restrictions on hunt-to stations.

## Station Security Codes

Station Security Codes (SSC) provide security to station users by preventing other users from accessing functions associated with the user's station. Each station user can change their own SSC if they know the station's current settings.

You must create a system-wide SSC change feature access code (FAC) before users can change their SSC. You must also provide users with their individual SSCs. A user cannot change a blank SSC.

### How to administer SSC

#### Required forms

| Form                               | Field                                  | Page                  |
|------------------------------------|--|-----------------------|
| Feature Access Code (FAC)          | ■ Station Security Change              | <a href="#">5-113</a> |
| Security-Related System Parameters | ■ Minimum Station Security Code Length | <a href="#">5-266</a> |
| Station                            | ■ Station Security Code                | <a href="#">6-4</a>   |

### End-user procedures

Table 4-95. How to change an existing station security code

| Information the user enters            | System response  | Explanation  |
|--|------------------|--|
| 1. Station security code (SSC)<br>FAC  | ■ Dial tone      | System is prompting for the extension, #, SSC, and #.  |
|  | ■ Intercept tone | The user entered an FAC not defined in the system or not allowed for this user.  |
| 2. Extension, followed by #, or only # | ■ No response    | The single # indicates that the user is referring to the extension associated with the terminal at which the user is entering the information.<br><br>If the user is using a voice terminal with a display, the # is the last character that the user sees until the command sequence is complete. |

*Continued on next page*

Table 4-95. How to change an existing station security code — *Continued*

| Information the user enters                               | System response     | Explanation   |
|---|---------------------|---|
| 3. SSC for the extension entered in step 2, followed by # | ■ Dial tone         | The system is prompting for the new SSC.  |
|   | ■ Intercept tone    | The extension is not in the numbering plan. Or the combination of the extension entered in step 2 and the SSC entered in step 3 is not valid. |
| 4. New SSC, followed by #                                 | ■ Dial tone         | The system is prompting for the new SSC again.  |
|   | ■ Intercept tone    | The SSC is shorter than the system-wide minimum station security code length or is longer than 8 digits.                                      |
| 5. New SSC again, followed by #                           | ■ Confirmation tone | The request is successful — the code is changed.  |
|   | ■ Intercept tone    | The user did not enter the same SSC in steps 4 and 5.   |
|   | ■ Reorder tone      | The station is being administered.  |

### Interrupting the command sequence and logging invalid attempts

If the user hears intercept tone after step 3, the system logs an invalid attempt via the Security Violation Notification (SVN) feature. This is true even if the user attempts to interrupt the change sequence with an asterisk.

If the user stops the change sequence by hanging up or pressing the disconnect or recall button before hearing intercept tone in step 3, the system does not log an invalid attempt.

If a user wishes to interrupt the change sequence after the FAC has been entered and before the final #, the user can enter \* to begin again. The system responds with dial tone.

If the user enters \* before the second # in step 3, the user must begin the change sequence at the point of entering the user's extension in step 2. (The user should not enter the FAC again.)

If the user enters \* in steps 4 or 5, the user must begin the change sequence at the point of entering the new SSC in step 4.

If the user hears intercept tone in any step, the command sequence has been invalidated for some reason and they must restart the process at step 1.

## **Interactions**

---

A user needs an SSC to use the following system capabilities:

- Demand printing
- Extended User Administration of Redirected Calls
- Leave Word Calling
- Personal Station Access
- Voice Message Retrieval

## Temporary Bridged Appearance

---

Temporary Bridged Appearance allows multiappearance voice terminal users in a terminating extension group (TEG) or personal central office line (PCOL) group to bridge onto an existing group call. If a call has been answered using the Call Pickup feature, the originally called party can bridge onto the call. This feature also allows a called party to bridge onto a call that redirects to coverage before the called party can answer it.

### How to administer Temporary Bridged Appearance

---

#### Required forms

---

| Form                              | Field                             | Page                  |
|-----------------------------------|-----------------------------------|-----------------------|
| Feature-Related System Parameters | ■ Keep Held SBA at Coverage Point | <a href="#">5-123</a> |

---

#### Detailed description

---

An incoming call to a TEG or PCOL group is not a call to an individual, although one particular member of the group can be the most qualified person to handle the given call. If this individual did not answer the call originally, this individual can bridge onto the call; the call does not have to be transferred.

A call to an individual can be answered by a call pickup group member. If the called party returns while the call is still connected, the called party bridges onto the call and the answering party hangs up.

Call Coverage provides redirection of calls to alternate answering positions (covering users). A temporary bridged appearance is maintained at the called voice terminal.

The called party can answer the call at any time, even if it is already answered by a covering user. If the called party does not bridge onto the call, the covering user can use the Consult function of Call Coverage to determine if the called party wants to accept the call. The Consult function uses the temporary bridged appearance maintained on the call. When the consult call is finished, the temporary bridged appearance is removed.

Stations that normally have a temporary bridged appearance with their coverage point do not have a temporary bridged appearance if the coverage point is AUDIX.

## Considerations

---

- Temporary Bridged Appearance allows the desired party to bridge onto a call without manually transferring the call, providing convenience of operation and saving time.
- Temporary Bridged Appearance does not provide any call originating capability or the capability to answer another party's calls. These capabilities are provided by the Bridged Call Appearance feature.
- If two parties are bridged together on an active call with a third party, and if the Conference Tone feature is enabled, conference tone is heard.
- The Bridged Call Appearance feature enhances Temporary Bridged Appearance by allowing more than one call to an extension to be bridged and by allowing calls to be originated from bridged appearances.

## Interactions

---

- Call Coverage

Calls redirected to Call Coverage maintain a temporary bridged appearance on the called voice terminal if a call appearance is available to handle the call. The called party can bridge onto the call at any time. The system can be administered to allow a temporary bridged appearance of the call to either remain at or be removed from the covering voice terminal after the principal bridges onto the call. If two parties are bridged together on an active call with a third party, and the bridging tone is administered to yes, all three parties hear the bridging tone.
- Consult

Consult calls use the temporary bridged appearance maintained on the call. At the conclusion of a consult call, the bridged appearance is no longer maintained. If the principal chooses not to talk with the calling party, the principal cannot bridge onto the call later.
- Conference and Transfer

If a call has, or has had, a temporary bridged appearance; is conferenced or transferred; and redirects to coverage again; a temporary bridged appearance is not maintained at the conferenced-to or transferred-to extension.
- Privacy — Manual Exclusion

When Privacy — Manual Exclusion is activated, other users are prevented from bridging onto a call. A user who attempts to bridge onto a call when this feature is active is dropped.

## Tenant Partitioning

---

Tenant Partitioning provides telecommunications services to multiple independent groups of users through a single DEFINITY ECS. Most commonly, Tenant Partitioning provides these services from a single provider to multiple tenants of an office complex. This eliminates the need for each tenant to purchase services separately, while still giving each tenant the appearance of a dedicated DEFINITY ECS. You can also use this feature to provide group services, such as departmental attendants, on a single-customer DEFINITY ECS. Tenant Partitioning also allows you to assign a unique music source for each tenant partition for callers who are put on hold.

### NOTE:

If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from, or pay fees to, a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI). You can purchase a Magic-on-Hold<sup>®</sup> system from AT&T, which does not require such a license.

## How to administer Tenant Partitioning

**Detailed description of Tenant Partitioning**

Tenants are defined and assigned by you, the system administrator. You must have the same authorization as that required for COR administration.

Because some features are not partitioned, you must take care to administer these features to prevent inter-tenant access. See [“Interactions” on page 4-574](#) for a list of these features.

You must ensure that:

- All tenants can call and be called by partition 1. This is the system default. If you change this default some call types fail. For example, *dial 0 fails*, as do SVN calls, ACA calls, etc.
- All stations in a call-pickup group are under control of the same tenant
- All stations with bridged appearances are under control of the same tenant
- Stations in different departments (for the purposes of attendant services) can call each other

See *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference* to determine the number of tenants that your system allows.

You must assign a tenant partition number to each object (endpoint, virtual endpoint, or other entity) that has an assigned COR. The exceptions are authorization codes and fixed-assignment virtual endpoints.

You administer Tenant Partitioning via the Tenant Partitioning form; you need to administer one form for each tenant partition. Begin the initial administration of the Tenant Partitioning feature by completing the tenant partitioning form. Keep in mind that you must specify an attendant group for each tenant that you define, even if there are no consoles assigned to the attendant group. You must also assign an attendant console to a tenant partition and you must assign a group number to the Attendant Console form.

## Tenant Partitioning capabilities

Tenant Partitioning can provide the following services to tenants: telephone equipment, building wiring, public and private network access, and attendant services. In addition, the feature can provide a full range of DEFINITY ECS capabilities to even the smallest tenant office, including Call Coverage, Remote Access, Night Service Routing, and others. Tenants can also purchase DEFINITY ECS adjuncts available on the switch, such as CMS activity reporting.

Tenant Partitioning provides advantages to both the telecommunications service provider and individual tenants:

- Shared resources offer enhanced services at lower cost to the tenant, with increased profit for the service provider.
- The tenant has the appearance of a dedicated DEFINITY ECS without the expense.
- All tenants can have attendant services.
- A trained, full-time system administrator can install, administer, and maintain the switch.

With proper administration, tenant resources, including trunking facilities, and all other switch endpoints can be protected from access by other tenants.

## Partitioning tenants

The default for Tenant Partitioning is one universal tenant for the system. This tenant, partition 1, is usually reserved for the service provider. By default it has access to all facilities and any other tenant can access it.

The service provider creates additional partitions based on tenant requirements. When deciding which tenant partitions to create, remember:

- You can assign each switch endpoint to one and only one tenant partition. And, you must pass each switch endpoint to a partition. For example, you must assign each voice terminal, attendant console, trunk, and virtual endpoint, such as an LDN or VDN, to a tenant partition.
- Most tenant partitions are discrete, separate units. By default, the system prevents all tenants, except partition 1, from accessing stations or trunking facilities belonging to other tenants. However, you can change this default. You can give explicit permission for one tenant to access another. For example, you can allow tenant 6 to call tenants 9 and 16 only.

 **NOTE:**

If a tenant has permission to call another tenant, it has access to every endpoint belonging to that tenant. For example, if tenant 6 has permission to call tenant 9, tenant 6 can also use any trunking facilities present in tenant partition 9.

- Even if two extensions are blocked from calling each other by Tenant Partitioning restrictions, either extension can still reach the other by dialing the extension's Direct Inward Dialing (DID) number via the public network.
- If any facilities are to be shared among tenants who do not want complete access to each other's facilities, you must group the shared facilities in a separate partition. For example, if two tenants share a trunk, but do not have direct access to each other's voice terminals, that trunk will need to be placed in its own partition so that both tenants can access it.

It is also important to consider the following constraints and requirements of access control, attendant services, music sources on hold, and network route selection when you establish or assign partitions.

### Access control

Features such as call coverage are limited by tenant-to-tenant access restrictions. For example, suppose tenant 1 includes a voice terminal from tenant 2 in its coverage path. If tenant 3 has permission to call tenant 1 but not tenant 2, a call from tenant 3 to tenant 1 skips the tenant 2 coverage point.

You may also want to set up tenants with special access privileges. For example, you might give a restaurant in an office complex permission to be called by any other tenant. Likewise, permission to call or be called by other tenants is helpful for building security or DEFINITY ECS administration or troubleshooting.

You can also assign all CO trunks to one tenant partition that can then be accessed by all other tenants.

### Attendant services

Tenant Partitioning allows you to provide personalized attendant services to each tenant.

The system provides one principal and one night or day/night attendant per attendant group. You assign each tenant an attendant group for service. Each attendant group has a separate queue. Queue warning lamps remain dark when Tenant Partitioning is active. However, information displayed when someone presses a queue-status button reflects the status of the attendant-group queue. The total number of calls queued for all tenants cannot exceed the system limit.

Attendant groups may serve more than one tenant. In this case, the attendant group cannot extend a call from one tenant via facilities belonging to another tenant, unless the former tenant has permission to access the other's facilities.

Each tenant may have a designated night-service station. The system directs calls to an attendant group in night service to the night-service station of the appropriate tenant (when a night attendant is not available). When someone places an attendant group into night service, all trunk groups and hunt groups that belong to tenants served by that attendant group go into night service. In this case, the system routes incoming calls to the night-service destination of the appropriate tenant. Each tenant can have its own listed directory number (LDN) night destination, trunk answer on any station (TAAS) port, or night attendant.

An attendant can specify that access to a trunk group is under attendant control if the trunk group is assigned to a tenant served by that attendant's group. The system directs any valid user attempt to access the trunk group to the attendant group serving the tenant.

### Network route selection

You can place trunk groups belonging to different tenants in the same route pattern. Calls routing to that pattern select the first trunk group in the pattern with access permission by the calling tenant (subject to normal constraints).

## Tenant partitioning examples

The following is a simple example of how you might administer Tenant Partitioning in an office complex.

You assign tenant partition 1, the universal tenant, as the service provider. All other tenants can call and be called by the service provider.

You assign tenant partitions 2–15 to individual businesses in the complex. You maintain the system-default restrictions for these tenants. That is, tenants cannot access voice terminals, trunking facilities, or other switch endpoints belonging to other tenants.

You assign tenant partition 16 to the restaurant in the building complex. You give all tenants permission to call this tenant. However, to prevent the restaurant from accessing trunks and other facilities belonging to tenants, you do not permit the restaurant to call any other tenants.

You assign tenant partition 17 to all CO trunk groups. You give all tenants permission to call this tenant.

You assign tenant partition 18 to a trunk group that tenants 3 and 7 want to share. You give Tenants 3 and 7 access to this partition; you deny all other tenants access. To prevent toll fraud, you do not allow tenant 18 to call itself.

The ARS route pattern can be the same for all tenants. In this example, the trunk for tenant partition 18 (the private trunk shared by tenants 3 and 7) is first in the route pattern. Tenant partition 17 is second. Tenants 3 and 7 route first to partition 18 and then as a second choice to partition 17. You deny all other tenants access to partition 18 and so the system routes them directly to partition 17.

All facilities that are not shared, including trunk groups, VDNs, voice terminals, attendant consoles, and other endpoints, are assigned to the tenant partition that they serve.

[Table 4-96](#) summarizes the calling permissions for the different partitions. Yes indicates that the partitions have permission to call and be called by each other; no indicates that partitions cannot call or be called by each other.

**Table 4-96. Calling permissions for partitions**

| Calling tenant partition number | Called tenant partition number |   |   |     |     |     |
|---------------------------------|--------------------------------|---|---|-----|-----|-----|
|                                 | 1                              | 2, 4—6, 8—15                                      | 3,7   | 16  | 17  | 18  |
| 1                               | yes                            | yes   | yes   | yes | yes | yes |
| 2, 4-6, 8-15                    | yes                            | Each partition can call itself but not the others | no  | yes | yes | no  |
| 3,7                             | yes                            | no  | Each partition can call itself but not the others | yes | yes | yes |
| 16                              | yes                            | no  | no  | yes | yes | no  |
| 17                              | yes                            | yes   | yes   | yes | yes | no  |
| 18                              | yes                            | no  | yes   | no  | no  | no  |

### Detailed description of Multiple Music-on-Hold

Tenant Partitioning allows you to assign each tenant a music source, unique to each tenant partition, to be heard when a call is placed on hold. This capability allows you to tailor the music or messages for the business needs of each tenant partition. However, keep in mind that the caller on hold hears the music source assigned to the partition at which the call initially terminates. For example, if calls coming into the DEFINITY ECS route first to an INTUITY automated attendant that then routes the call to the appropriate tenant partition, the caller on hold hears the music source of the INTUITY automated attendant, not the tenant partition to which it is routed. Likewise, if a caller in tenant partition 2 makes an out-going call using tenant partition 1's trunk groups, the caller will hear the music source assigned to tenant partition 1.

The maximum number of music sources allowed is the same as the maximum number of tenant partitions allowed; each music source can be used by one or more tenant partitions.

You can assign one of the following music-on-hold types to each tenant partition.

**Table 4-97. Music-on-Hold Types**

---

| Type  | System Response for a caller placed on hold  |
|-------|--|
| none  | silence  |
| tone  | system-wide administered tone  |
| music | the music associated with the administered port. The number of possible music sources equals the number of possible tenant partitions. Each partition can have its own music source. |

---

## Interactions

---

Tenant-partition identification is not passed between switches. A network of DEFINITY ECS systems does not enforce Tenant Partitioning restrictions without special administration. For example, Tenant Partitioning on a network of DEFINITY ECS systems does not enforce tenant-specific tie trunks.

Administration of the following features requires special care to avoid undesired intertenant access.

- Bridging
- Call Pickup
- Controlled Restriction
- Facility Busy Indication
- Facility Test Calls
- Integrated Directory
- Inter-PBX Attendant Calls
- Main/Satellite/Tributary
- Malicious Call Trace
- Personal CO line
- Private Networking (AAR)
- Uniform Dial Plan

The function of any feature that specifies a tenant partition is affected by tenant-to-tenant restrictions, as follows.

- AAR/ARS

Do not confuse tenant partitions with Time-of-Day Plan Numbers and Partition Groups in AAR/ARS. You can still use Time-of-Day Plan Numbers and Partition Groups can still be used to select one of eight route patterns for AAR/ARS routing when Tenant Partitioning is in effect.

- Attendant and Attendant Group Features

Tenant Partitioning creates multiple attendant groups. Attendant operations such as direct-station or trunk-group select (DCS/DTGS) are subject to tenant-to-tenant restrictions, both at selection time and at split time.

All calls put on hold by an attendant from the attendant group hear the music source from the attendant group.

- Attendant Control of Trunk-Group Access

An attendant group controls access only to trunk groups that belong to tenants that are served by that attendant group.

- AUDIX, DEFINITY AUDIX, and AUDIX Voice Power

AUDIX voice and data ports are subject to the same tenant-to-tenant restrictions as any other endpoint.

AUDIX can restrict one group of subscribers from sending voice mail to another group. The tenant-partitioning provider can create up to 10 different communities within each AUDIX that either have or do not have permission to send voice messages across community boundaries.

- Automatic Wakeup

Wakeup music will be the music source assigned to the wakeup station's tenant partition.

- Bridged Call Appearance

All stations with bridged call appearances should be administered to be under control of the same tenant.

- Call Coverage

Tenant-to-Tenant access restrictions apply to coverage paths. If a tenant cannot access a particular tenant, it cannot access that tenant as part of another tenant's coverage point.

When an attendant is specified as part of a coverage path, the attendant group of the called tenant, not the calling tenant, is accessed.

When a call goes to coverage, is answered, and is put on hold, the music on hold is the music source assigned to the tenant partition of the terminal that was originally called.

- Call Detail Record (CDR)

CDR does not report the tenant partition number of the extension or trunk group used. You must infer the tenant partition number from the extension or trunk-group number.
- Call Pickup

Administer all stations in a call-pickup group to be under control of the same tenant. The system supports Call Pickup only if the caller and the called party can both call the pickup user. The caller and the called party do not need to be in the same pickup group.
- Call Vectoring/VDN

A caller routed to a new destination by a vector step hears the music assigned to the new destination.
- CMS

You can administer CMS to provide CMS reports to each tenant. You can restrict each CMS login to control, on a permission basis, only those entities that are assigned to a particular tenant. Outputs to separate printers allow any tenant to print their own CMS reports. The tenant-partitioning provider must administer CMS to provide this separation of tenant permissions.
- Dial Access to Attendant

When a tenant dials an attendant, it accesses its own assigned attendant group.
- Emergency Access to the Attendant

When a tenant dials emergency access, it accesses its own assigned attendant group.
- Intercept Treatment

When access to the attendant is designated as intercept treatment, the caller accesses their assigned attendant group.
- Malicious Call Trace

By default, Malicious Call Trace extensions are assigned to tenant partition 1. Therefore, if Malicious Call Trace is enabled, any voice terminal with permission to call tenant partition 1 can use it.
- Multiple Listed Directory Numbers

Each Listed Directory Number is assigned to a tenant partition.
- Multiple Audio/Music Sources for Vector Delay

When music is administered on the wait-time vector step, the music played is the music source of the VDN's tenant number.

## 4 Basic Features

### Tenant Partitioning

Page 4-577

- Music-on-Hold Access

When `Tenant Partitioning` is enabled, you can assign a unique source for music to each tenant. If `Tenant Partitioning` on the System-Parameters Customer-Options form is set to **y**, you must use the Music Sources form to administer music-on-hold.

- Night Service

Each tenant can have its own Listed Directory Number (LDN) night destination, Trunk Answer on Any Station (TAAS) port, or night attendant.

- PC Interfaces

You must assign each PC interface to a tenant partition.

- PC/PBX Connections

You must assign each PC/PBX Connection to a tenant partition.

- PC/ISDN

You must assign each PC/ISDN to a tenant partition.

- Remote Access

You must assign each Remote Access barrier code to a tenant.

- Traffic Studies

Traffic studies do not report the tenant partition number of the extension or trunk group used. You must infer the tenant partition number must be inferred from the extension or trunk-group number.

- Uniform Dial Plan

If a Uniform Dial Plan is in place between switches, tenant partition identification is not passed between the switches, and so tenant-partition restrictions are not enforced between the switches without special administration.

**NOTE:**

Tenant Partitioning restrictions do not override COR restrictions. COR restrictions are independent of tenant partitions.

## Terminal Self Administration

---

Terminal Self-Administration (TSA) allows users to administer some of their own feature buttons from their own terminal. Users are prompted, via the terminal's display, to choose features to assign to buttons on their voice terminals. TSA can be administered on 6400-series display voice terminals or display voice terminals that have a firmware upgrade to support the Admin mode, provide at least four softkeys, and have 2 X 24 displays.

### How to administer TSA

---

Before administering TSA, make sure that:

- The voice terminal is plugged into its jack.
- The voice terminal is defined with an extension and an assigned port location.

### To administer the Admin button

On the 6400 Station form, administer the Admin button as "admin." You can assign this button to a feature button or a softkey.

### To administer whether a security code is needed to enter TSA

On page 2 of the Change System-Parameters Security form:

- Type **y** in the `Security Code for Terminal Self-Administration Required?` field if the user will have to enter a security code after they press the Admin button.
- Type **n** if the user will not have to enter a security code.

**NOTE:**

If you type **y** in this field, assign the user a security code on the first page of the 6400 Station form.

### To administer user-defined language for displayed messages

If the displayed language is set to "user-defined" for any user in the system, change the translation for each "user-defined" message to the language that the user requests.

1. Use the **change display-messages self-administration** command to access the 3-page Change Display-Messages Self-Administration form.
2. Change the translation for each "user-defined" message to the language that the user requests.

## Detailed description

---

Before a user can enter the TSA Admin mode, their terminal must be completely idle. If the terminal is not idle, the user receives a beep tone and the button press is ignored.

After a user presses the Admin button and enters a security code (if necessary), they are prompted, via the terminal's display, to choose features to administer to buttons on their voice terminal. The user can add, replace, or delete any of the following feature-button types from their voice terminal. Also, the user can change some, but not all, auxiliary data associated with these buttons.

- CDR Account Code
- Automatic Dial
- Blank
- Call Forwarding
- Call Park
- Call Pickup
- Directed Call Pickup
- Group Page
- Send All Calls
- Activate Whisper Page
- Answerback for Whisper Page
- Whisper Page Off

End-user button changes are recorded in the system history log and security code attempts and successes are recorded in the Security Violations Notification (SVN) log so that remote services can know what translations are changed.

See *6400-Series Single-Line Telephone User's Guide (555-230-738)* and *6400-Series Multi-Line Telephone User's Guide (555-230-739)* for more information about user interactions.

## Considerations

---

### Security

To prevent people from either accidentally or maliciously changing other people's phone administration, TSA provides a system-wide option of requiring a security code before the user can enter the Admin mode to administer their buttons. The security code used by this feature is the same as the Personal Station Access (PSA) code, which is also used by the telecommuting feature, Call Coverage — Off-Net.

If this administrable option is turned on, after pressing the Admin button on 6400 terminals, the user is prompted for their PSA security code. They must enter it, followed by either pressing the pound sign (#) button or the Done softkey. If the user enters the wrong security code, they see an appropriate error message on the display. All of the security violation thresholds, reports, and measurements that currently apply to the entry of PSA security codes during PSA feature activation also apply to the entry of PSA security codes during TSA.

To prevent voice terminals from accidentally being left in the Admin mode, the switch returns a voice terminal from the Admin mode to the Normal mode five minutes after the voice terminal enters the Admin mode or successfully programs a button, whichever is later.

## Interactions

---

### NOTE:

When a terminal is in the Admin mode, the terminal cannot accept any calls — the terminal is treated as if it were busy. Also, a user cannot make calls while in the Admin mode.

Any button state a voice terminal is in when the voice terminal enters the Admin mode stays active while the voice terminal is in the Admin mode.

- ACD Agents

ACD agents who wish access to the Admin mode of TSA must be logged off before pressing the Admin button. If they are not logged off when they attempt to enter the Admin mode, they receive a denial (single-beep) tone.

- Administered Connections

A voice terminal that is an endpoint of an administered connection is always active on a call, therefore TSA cannot be used.

- Attendant Direct Extension Selection with Busy Lamp

The attendant console's voice terminal status module shows voice terminals in the Admin mode as busy.

- Attendant Intrusion

Attendant intrusion is not possible on a voice terminal that is in the Admin mode.

- Automatic Callback

Automatic Callback stays active if a switch-generated automatic callback call comes in while a voice terminal is in the Admin mode. The call-back call is redirected to coverage.

- Automatic Wakeup

Automatic Wakeup treats a voice terminal in the Admin mode as busy.

## 4 Basic Features

### Terminal Self Administration

Page 4-581

- **Busy Verification**

Busy Verification shows a voice terminal in the Admin mode as busy.
- **Call Coverage**

A Call Coverage path is followed when the terminal is in the Admin mode because the switch treats the phone as being busy.
- **Call Forwarding**

Call Forwarding can be active and works correctly in the Admin mode. An active Call Forwarding button cannot be removed when the terminal is in the Admin mode.
- **Call Forwarding — Busy/Don't Answer**

A Call Forwarding — Busy/Don't Answer can be active and works correctly in the Admin mode.
- **Call Park**

Call Park can be active and works correctly in the Admin mode.

If a parked call times out while the parking extension is in the Admin mode, the call is treated the same as if all appearances on the parking set had been busy. The call routes to the attendant, a night service extension, or the coverage path; or is dropped.
- **CAS Backup**

CAS Backup can be active and works correctly in the Admin mode.
- **Class of Service**

All classes of service can access this feature.
- **Facility Busy Indication**

A facility busy indication button for a voice terminal in the Admin mode appears as busy.
- **Headset**

Since the terminal must be on-hook to go into the Admin mode, the Headset On/Off button must be in the OFF position.
- **Intrusion and Rering**

This feature blocks Russian and Chinese intrusion. A voice terminal cannot enter the Admin mode while it has a call appearance on hold awaiting Russian or Spanish rering because it is not considered completely idle.
- **Personal Station Access (PSA)**

A voice terminal that is in the Admin mode of TSA cannot be remotely unmerged by the PSA feature.

**4 Basic Features**

*Terminal Self Administration*

*Page 4-582*

- Ringing — Abbreviated and Delayed

If this feature is active, a call can be silently ringing at a voice terminal and the user may not realize it. This prevents the user from entering the Admin mode of TSA.

- Send All Calls (SAC)

Send All Calls can be active for a terminal in the Admin mode. The SAC state is unaffected by the terminal being in the Admin mode.

## Terminal Translation Initialization

Terminal Translation Initialization (TTI) allows you to merge an Administered Without Hardware (AWOH) station to a valid port by dialing a system-wide TTI security code and the extension from a terminal connected to that port. TTI also allows you to separate a station from its port by dialing a similar separate digit sequence. This action causes the station to be administered without hardware.

### How to administer TTI

#### Required forms

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Feature-Related System Parameters | ■ TTI Enabled   | <a href="#">5-123</a> |

### Detailed description

If TTI is active, and you want to disassociate a station, set `Port` to **X** (Station, Attendant, and Data Module forms). If TTI is not active, then a port that is separated from its station or data module becomes an unadministered port.

When TTI is enabled for voice, all voice ports (except BRI ports) become TTI ports or ports from which a TTI merge sequence can occur.

TTI can be used for implementing station and data module moves from office to office. That is, the user separates the station from its port with TTI, unplugs the station from the jack, plugs the station in a jack in a different office, and merges the station to its new port with TTI. To activate a station, dial the FAC, TTI Security Code, and the extension at the new location.

## TTI merge from a voice TTI port

Before you can merge a voice station, you must set **TTI State** to **voice** on the Feature-Related System-Parameters form. You also must set the station to match the port type of the TTI port making the merge request. For example, a digital terminal type can merge only to a port on a digital board.

### **CAUTION:**

*You can destroy your hardware if you attempt to connect an analog station to a digital port.*

To merge a station and a terminal with TTI, complete the following steps from the terminal to which the station is to be merged:

1. Dial the TTI merge FAC.
  - If the code is correct, you receive dial tone.
  - If the code is not correct, you receive intercept tone.
2. Dial the TTI security code from the terminal to which the station is to be merged.
  - If the code is correct, you receive dial tone.
  - If the code is not correct, you receive intercept tone.
3. Dial the extension of the station to be merged.
  - If the extension is valid, you receive confirmation tone, which may be followed by dial tone. (It is possible to receive intercept tone immediately following the confirmation tone. If this happens, you need to attempt the merge again.)
  - If the extension is valid, but the extension is being administered, you receive reorder tone. Try the merge again later.
  - If the extension is invalid, you receive intercept tone.
  - If the system is busy and cannot complete the merge, you receive reorder tone. Try the merge again later.
  - If the station has a download status of pending, you receive reorder tone. You need to change the download status to complete to successfully complete the TTI merge.

## TTI separation from a voice station

To complete a TTI separation, complete the following steps from the terminal that needs to be separated:

1. Dial the TTI separate FAC.
2. Dial the TTI security code.
  - If the code is correct, you receive dial tone.
  - If the code is not correct, you receive intercept tone.
3. Dial the extension of the station to be separated.
  - If you have dialed the extension of the station currently merged with this terminal, you receive confirmation tone.
  - If you have dialed the extension of the station currently merged with this terminal, but the extension is being administered, you receive reorder tone. Try the separation again later.
  - If you have not dialed the extension of the station currently merged with this terminal, you receive intercept tone.
  - If the system is busy and cannot complete the separation, you receive reorder tone. Try the separation again later.

## Terminal separation from other terminals

The previous examples are for voice terminals. TTI also supports attendants, data modules, voice/data terminals, and ISDN-BRI terminals.

### Attendants

In order for attendants to use TTI, you must assign an extension to the attendant console. TTI port translations are the same for digital voice terminals and attendant consoles. To merge a digital TTI voice port and an attendant, you must first administer the attendant as AWOH. Then a digital voice station must be plugged into the jack assigned to the attendant console, and the TTI merge digit sequence must be entered on the digital voice station. Once the TTI merge has been completed for the attendant console, the digital station must be unplugged and the attendant plugged into the jack.

An attendant console can be separated from its port only through administration. A TTI separate request from an attendant console gives the user intercept treatment.

### Data modules

Data modules have different tones and digit sequences.

In the merge and separate control flow, different tones are given to the voice terminal user to give the current status of the TTI operation. Instead of audible tones, status messages are displayed on a terminal connected to a data module

## 4 Basic Features

### Terminal Translation Initialization

Page 4-586

when activating the TTI sequence through keyboard dialing. If `TTI State` is set to **data**, you see the data display messages. If `TTI State` is set to **voice**, you hear the tones.

For a stand alone data module, the TTI merge/separate digit sequence is entered in one line at a dial prompt:

- DIAL: <TTI feature access code><TTI security code><AWOH ext>

Separate prompts are not given for the TTI security code and extension.

### Voice/data terminals

A station with a data terminal (DTDM) is treated as a voice terminal in the TTI merge and separation sequence. The DTDM is merged with and separated from its hardware translation at the same time the station is merged or separated. The TTI merge and separate sequence can only be initiated through the voice station for DTDMs; it cannot be initiated through the data port.

### ISDN BRI terminals

The TTI separation sequence for Automatic-TEI SPID-initializing BRI terminals is identical to the sequence used for voice terminals. However, the merge sequence is different.

- Separation sequence
  1. Feature Access Code
  2. Security Code
  3. Extension
- Merge sequence
  1. Connect the station to any port to get power.
  2. Program the SPID to the extension with which it will be merged.
  3. Unplug the station (this is necessary even if the station is connected to its intended port).
  4. Connect the station to its intended port (this port should indicate Equipment Type: TTI Port).
  5. Receive dial tone.
    - If there is dial tone, the merge is complete.
    - If there is no dial tone, the terminal's SPID is not an available extension.

You can dial the TTI merge sequence for BRI sets only if a user separates a BRI extension from its set and then wants to undo the process by reassociating the set to the same extension. Note that you cannot use the SAT to put an X in the port field of a BRI set that is still connected to the switch. You must use the TTI separation sequence from the set.

## Analog Queue Warning Ports and External Alert Ports

The analog queue warning port (used for hunt groups) and the external alert port may be AWOH. These extensions can be merged to an analog port via TTI. The merge must be done by an analog set, and then the analog set is unplugged from the port. These extensions cannot be separated from their port location with the TTI feature. A TTI separate request from one of these ports gives you intercept treatment.

### Security measures

---

#### SECURITY ALERT:

*If you do not manage this feature carefully, its unauthorized use may cause you security problems. For example, someone who knows the TTI security code could disrupt normal business functions by separating voice or data terminals. You can help protect against this action by frequently changing the TTI security code. You can further enhance system security by removing the FAC from the system when it does not need to be used (for example, there are no moves going on at present). Consult the BCS Systems Security Handbook for additional steps to secure your system and find out about obtaining information regularly about security developments.*

### Considerations

---

- The `TTI Ports` field on the System Capacity form shows the number of TTI ports used in a switch. This field shows only the number of TTI ports being administered. This is a required field. If a TTI exceeds the maximum number of ports, the port is not administered and cannot be added. In that case, a station cannot be added.

BRI endpoints are only counted as one TTI port. For example, for every two BRI endpoints, one TTI port is counted. As such, you can have two stations assigned to one port. If either endpoint is administered, the TTI port count is decremented by 1. You can verify this by using the **list configuration station** command.

- The total number of translated voice terminals and Voice TTI ports in a system is limited to the maximum number of administered stations supported in the system. The total number of translated data terminals and Data TTI ports in a system is limited to the maximum number of administered data modules allowed in the system.
- Set `TTI State` to **voice** and then set `TTI State` to **data**. When you use this order, voice and then data, you reduce the chance of a user trying to use TTI on a data-only terminal that does not have TTI port translation. This can happen when the number of voice terminals allowed by the system is twice the number of data terminals. For example, if the system

## 4 Basic Features

### Terminal Translation Initialization

Page 4-588

limit for voice terminals is 15,000 and 7,500 for data, then when TTI was turned on for data first, only the first 7,500 unadministered ports would get TTI port translations.

- When TTI is activated for the system, the following actions take place:
  - If `TTI State` was previously activated but in a different state (such as, a voice to data state), the old TTI translations are removed and the new ones added on a board by board basis.
  - If `TTI State` is set to **voice**, then default TTI translations are generated for every unadministered port on all digital, hybrid, and analog boards.
  - If `TTI State` is set to **data**, then default TTI translations are generated for every unadministered port on all digital and data line boards in the system.
  - Whenever a new digital board is inserted when the system is in TTI Data mode, or when a digital, hybrid, or analog board is inserted when the system is in TTI Voice mode, the unadministered ports on the board become TTI ports.
  - When TTI is deactivated, all translation for the TTI ports are removed in the system; the ports return to an unadministered state.
- When a set is successfully merged or separated through the use of TTI, the transaction appears in the system transaction log.

## Interactions

---

- Attendant

Because the attendant is a central focus for incoming calls, you should have the attendant in Position Busy mode. This routes incoming calls away from an attendant attempting to separate. It is possible to have the attendant in Position Available Mode and still separate. Any calls queued, held, or seen as active for the attendant prevent separation.
- Attendant Night Service

The night service station cannot be separated while in night service.
- Attendant Release Loop Operation

All calls held with the release loop operation by the attendant are reclassified as attendant group calls if the attendant separates before the attendant-timed reminder-interval expires.
- Automatic Callback

If a station has Automatic Callback active for another station, executing TTI separate for either station breaks the automatic callback sequence.

## 4 Basic Features

### *Terminal Translation Initialization*

Page 4-589

- Bridged Call Appearance

If a station has a bridged call appearance of an off-hook station, the station with the bridged call appearance can separate at any time and not disrupt a call in progress. Likewise, the principal can separate without disrupting an active call on its bridged appearance.

If a station with a bridged call appearance merges itself while the extension for the bridged appearance is active on a call, that station can join the call after it has completed the merge sequence.

- Call Coverage

If a station separates while Send All Calls or Goto Coverage is active, these features remain active while the station has no hardware translation.

You can separate a station that is the target of Send All Calls or Goto Coverage; the features function as if the station were busy.

- Call Coverage Answer Group

If a station was AWOH, then rejoins the group as a result of a TTI merge, a PSA associate, or administrative port assignment, that station is excluded from all transactions already active in the call coverage answer group.

- Call Forwarding

A station can separate while Call Forwarding is active. If a destination extension for call forwarding separates, Call Forwarding to that extension remains active. Calls forwarded while the station is separated hear a busy signal.

- Call Pickup

If a line appearance is available, a member of a call pickup group may separate at any time. If a call is attempting to terminate, and a member of a group associates, that member does not join the group for the call that is currently in progress, but is available for all subsequent calls to that group.

- Customer Provided Equipment Alarm

A station administered with a CPE alarm will retain that alarm indication when it is merged.

- Expert Agent Selection

Station user records cannot be shared between TTI ports and EAS login ID extensions. This reduces the number of possible TTI ports your system provides, depending on the number of administered EAS login IDs. For example, if you administer 2,000 EAS login IDs, the maximum number of TTI ports that the system can provide is reduced by 2,000.

- Hunt Group Uniform Call Distribution/Direct Department Calling

The system excludes stations previously AWOH as a result of a TTI separate, a PSA dissociate, or administration from all transactions already active in the hunt group when the station is merged.

## 4 Basic Features

### *Terminal Translation Initialization*

Page 4-590

- Message Light

Messages need not be deleted prior to separation. If a station receives messages while it is in the untranslated state, the message lamp is updated when the terminal receives hardware translation.

- Personal Station Access

TTI must be enabled for the system to use PSA to allow an individual user to have TTI-like capabilities for a single station.

- Save translations

All port translations made using TTI are saved when you save translations.

- Send All Calls

Send All Calls remains active when a station becomes separated.

- Terminating Extension Group

If any member of the TEG previously AWOH as a result of TTI, PSA or station administration is merged, that member is excluded from all transactions already taking place in the TEG when that member is merged. This means that a member that merges does not have access to a call already active in the TEG. The member is able to join in all subsequent calls to the group.

- Transfer

After a connection has been established from the first to the third party, the second party, the one who performed the transfer, can be separated.

## Terminating Extension Group

---

Terminating Extension Group (TEG) allows an incoming call to ring as many as 4 voice terminals at one time. Any user in the group can answer the call.

### How to administer TEG

---

#### Required forms

---

| Form                        | Field   | Page                  |
|-----------------------------|---|-----------------------|
| Terminating Extension Group | <ul style="list-style-type: none"> <li>■ All</li> </ul>   | <a href="#">5-295</a> |
| Station (multiappearance)   | <ul style="list-style-type: none"> <li>■ Button/Feature Button Assignments                             <ul style="list-style-type: none"> <li>— term-x-gr (Grp:___)</li> <li>— exclusion</li> <li>— send-term (Grp:___)</li> <li>— aut-msg-wt (Ext:___)</li> </ul> </li> <li>■ Bridged Call Alerting</li> </ul> | <a href="#">6-14</a>  |

### Detailed description

---

You can administer any voice terminal as a TEG member; however, only a multiappearance voice terminal can be assigned a TEG button with merged-status lamp. The TEG button allows the user to select a TEG call appearance for answering or bridging onto an existing call but not for call origination.

When an incoming call is answered by a TEG member, a temporary bridged appearance is maintained at the multiappearance voice terminals in the group. However, this appearance is not visible. Any TEG members can bridge onto the call by pressing the TEG button.

### Considerations

---

- A voice-terminal user can be a member of more than one TEG, but can have only one TEG button for each group.
- A TEG can handle only one TEG call at a time. Additional calls do not reach the TEG. If a coverage path is assigned to the TEG, the additional calls route accordingly.

## Interactions

---

- Automatic Callback

This feature cannot be active for a TEG.
- Bridged Call Appearance

Calls to a TEG cannot be bridged, except via a Temporary Bridged Appearance.
- Call Coverage

A TEG can have a Call Coverage path assigned, but cannot be a point in a Call Coverage path.

A Send Term button for the TEG can be assigned to group members who have multiappearance voice terminals. When a user presses Send Term, calls to the TEG redirect to coverage. The merged status lamp lights on all voice terminals with a Send Term button. Any member with a Send Term button can deactivate Send Term by pressing the button. Incoming calls are again directed to the group.
- Call Park

A TEG call cannot be parked on the group extension. However, a group member answering a call can park a TEG call on their own extension.
- Direct Department Calling and Uniform Call Distribution

A TEG cannot be a member of a DDC or UCD group.
- Internal Automatic Answer

TEG calls are not eligible for IAA; however, calls placed to an individual extension are eligible.
- Leave Word Calling

LWC messages can be stored for a TEG and can be retrieved by a member of the group, a covering user of the group, or a system-wide message retriever. Voice Terminal Display and proper authorization can be assigned to the message retriever. Also, a remote Automatic Message Waiting lamp can be assigned to a group member to provide a visual indication that a message has been stored for the group. One indicator is allowed per TEG.
- Privacy — Manual Exclusion

Privacy — Manual Exclusion can be assigned to any of the voice terminals in a TEG to prohibit bridging by other group members. A TEG member who attempts to bridge onto a call with Privacy — Manual Exclusion active is dropped.

**4 Basic Features**

*Terminating Extension Group*

*Page 4-593*

- **Temporary Bridged Appearance**

At multiappearance voice terminals in the TEG, a temporary bridged appearance is maintained after a call is answered. Other members of the group can thus bridge onto the call.

## Timed Reminder and Attendant Timers

---

Timed Reminder automatically alerts the attendant after an administered time interval. The attendant can reenter the call and decide whether to terminate the call or permit the waiting to continue.

### How to administer Timed Reminder and Attendant Timers

---

#### Required forms

---

| Form               | Field                    | Page                 |
|--------------------|--------------------------|----------------------|
| Console-Parameters | ■ No Answer Timeout      | <a href="#">5-86</a> |
|                    | ■ Alerting               |                      |
|                    | ■ Timed Reminder on Hold |                      |
|                    | ■ Return Call Timeout    |                      |

---

### Detailed description

---

Use this feature for the following types of calls:

- Extended calls waiting to be answered or waiting to be connected to a busy single-line voice terminal
- One-party calls placed on hold by an attendant
- Incoming calls that are answered by a voice-terminal user, transferred and unanswered.

Attendant Timers include:

- Unanswered DID Call Timer — Specifies how long a DID call can go unanswered before it routes to the administered DID/TIE/ISDN Intercept Treatment.
- Attendant Return Call Timer — For unanswered calls that were extended by the attendant, they are returned to the same attendant who released them if the attendant is available. Otherwise they return to the attendant-group queue. The Attendant Return Call Timer is not set for calls extended from one attendant to another individual attendant.

## 4 Basic Features

### *Timed Reminder and Attendant Timers*

Page 4-595

- **Attendant Timed Reminder of Held Call Timer** — Specifies how long a call is held. When the timer expires, the held call alerts the attendant. The message `hc` appears on the attendant display. You can administer either a high-pitched ring or a primary alert.

**Attendant No-Answer Timer** — Specifies how long a call that terminates at an attendant console can ring with primary alerting. When the call reaches this interval setting, it rings with a secondary, higher-pitch ring. A disabled Attendant No Answer Timer's ringing pattern does not change over from the primary to the secondary pattern. If the call remains unanswered during this interval, it routes to the attendant group and console where the call was placed in a Position Busy state. This feature does not apply to calls placed to the attendant's personal number or to calls originated by the attendant.

- **Attendant Alerting Interval (Timed Reminder)** — Specifies how long a call that terminates at an attendant console can ring with secondary alerting. When the call reaches this interval, the attendant console is placed into position busy mode and the call forwards to the attendant group. If the console where the alerting interval is reached is the last active day console, then the system goes into night service if night service is enabled. This feature does not apply to calls placed to the attendant's personal number or to calls originated by the attendant.

You can disable the alerting interval. In this case, a call continues to ring at the original attendant's extension until the caller hangs up or another feature disconnects the call (for example, reaching the timeout limit for unanswered DID calls during night service.)

- **Line Intercept Tone Timer** — Specifies how long line intercept can be. For example: `LITT:10` seconds means that line intercept stops after 10 seconds.

The attendant no answer and alerting timers do not apply to calls placed to the attendant's extension. And they do not apply to calls originated by the attendant.

## Considerations

- Timed Reminder informs the attendant that a call requires additional attention. After the attendant reconnects to the call, the attendant explains that the user can either try another extension, hang up, or continue to wait. This personal attention can help establish rapport with clients and customers.
- Assign the Timed Reminder intervals separately for calls waiting for connection and for calls placed on hold. Each interval can be from 10 seconds to 17 minutes.
- If a call routes to each attendant and remains unanswered, the system goes into night service. If this happens too frequently, you can lengthen the timer intervals.

## Interactions

---

- Attendant Call Waiting

An attendant-extended call to a busy single-line voice terminal returns to an attendant if the Timed Reminder Interval expires before the call answers or redirects to coverage.

- Call Coverage

If a voice-terminal user transfers a call to an on-premises voice terminal and the call remains unanswered at the expiration of the Timed Reminder Interval, the call redirects to an attendant. Redirection occurs even if the call redirects via Call Coverage or Call Forwarding from the transferred-to voice terminal.

An attendant-extended call redirects to coverage instead of returning to an attendant if the coverage criteria are met before the Timed Reminder Interval expires. However, unanswered calls return to an attendant at the expiration of the interval.

If a call alerts an attendant as a coverage call (unanswered station-to-station call with the "attd" (attendant) in the called station's coverage path form), the secondary alerting tone does not sound.

- Centralized Attendant Service

If an attendant at the main location transfers a call from a branch location to an extension at the main location, the timed reminder does not apply and the call does not return to the attendant if unanswered.

- Transfer

A transferred call that times out redirects to an attendant after an interval equal to the Attendant Return Call timer.

## Transfer

---

Transfer allows voice-terminal users to transfer trunk or internal calls to other voice terminals or trunks without attendant assistance.

### How to administer Transfer

---

#### Required forms

---

| Form                              | Field   | Page                  |
|-----------------------------------|---|-----------------------|
| Feature-Related System Parameters | ■ Music on Transferred Trunk Calls              | <a href="#">5-123</a> |
|                                   | ■ Intercept Treatment on Failed Trunk Transfers |                       |

---

### Considerations

---

- You can administer transferred-trunk calls to receive either music or silence if the first part of the transfer places the call on hold.
- Multiappearance voice terminals must have an idle appearance to transfer a call.
- Single-line voice-terminal users momentarily flash the switchhook or press Recall, dial the desired extension, and hang up. Multiappearance voice-terminal users press Transfer, dial the desired extension, and press Transfer again.

### Interactions

---

- Attendant Conference

This may not operate properly if the CO does not provide answer supervision. In that case, `Answer Supervision Timeout` and `Outgoing End of Dial` (on the CO Trunk Group form) must be set to the same non-zero number. `Receive Answer Supervision` must be set to **n**.

If the CO does provide answer supervision, `Answer Supervision Timeout` and `Outgoing End of Dial` must be set to **0** and `Receive Answer Supervision` must be set to **y**.
- Integrated Services Digital Network Basic Rate Interface (ISDN-BRI)

When an ISDN-BRI station, assigned with `Select Last Used Appearance` set to **y**, completes a transfer while off-hook using the handset, the user is left listening to dial tone on the last-used appearance.
- Internal Automatic Answer

Transferred calls can be answered automatically via IAA.

- QSIG Networking

If calls over an ISDN-PRI trunk are administered for Supplementary QSIG, then additional call information may display.

- Station

When a multifunction station (BRI/digital/hybrid) dials enough digits to route a call, but the call could route differently if additional digits were dialed, the station does not recognize the Conference Or Transfer buttons. The user must delay dialing for 3 seconds or dial # to indicate that the call can be routed based on the digits already dialed. The Conference Or Transfer buttons then are recognized and the switch completes the operation.

Station users cannot transfer the attendant.

## Transfer — Outgoing Trunk to Outgoing Trunk

---

Outgoing Trunk to Outgoing Trunk Transfer (OTTOTT) permits a controlling party (such as a station user or attendant) to initiate two or more outgoing trunk calls and then connect the trunks. This operation removes the controlling party from the connection and conferences the outgoing trunks. Alternatively, the controlling party can establish a conference call with the outgoing trunks and then drop out of the conference, leaving only the outgoing trunks on the conference.

### NOTE:

This is an optional enhancement to Trunk-to-Trunk Transfer and requires careful administration and use. Distributed Communication System (DCS) Trunk Turnaround may be an acceptable and safer alternative to this feature.

OTTOTT allows calls to be established in which the only parties involved are external to the switch and are on outgoing trunks. This type of call can result in locked-up trunks, such as trunks that cannot be disconnected except by busy-ing-out and releasing the affected trunk circuit. To clear the lockup, a service technician must reseal the trunk board, or busy-out and release the affected trunk.

### How to administer OTTOTT

---

#### Required forms

| Form                              | Field                        | Page                  |
|-----------------------------------|------------------------------|-----------------------|
| Trunk Group                       |                              | <a href="#">7-115</a> |
| — Access Endpoint                 | ■ Disconnect Supervision-Out | <a href="#">7-72</a>  |
| — APLT                            | ■ Disconnect Supervision-Out | <a href="#">7-156</a> |
| — CO (Central office)             | ■ Disconnect Supervision-Out | <a href="#">7-168</a> |

| — Tandem                          | ■ Disconnect Supervision-Out | <a href="#">7-257</a> |
| — Tie                             | ■ Disconnect Supervision-Out | <a href="#">7-262</a> |
| — WATS                            | ■ Disconnect Supervision-Out | <a href="#">7-268</a> |
| Feature-Related System Parameters | ■ Trunk-to-Trunk Transfer    | <a href="#">5-123</a> |

## Detailed Description

---

You must administer at least one outgoing trunk to support OTTOTT and the network must provide network-answer supervision. The answer supervision test increases the probability, but does not guarantee, that a disconnect signal is received from the remote end of the trunk. To mitigate problems associated with its accidental use, this feature is administrable only on trunk groups on the Trunk Group form. It is not a system option.

DCS networks provide a similar but more restrictive version of this feature, called DCS Trunk Turn Around, which permits two outgoing trunks to be connected when the switch at the remote end of one of the trunks agrees to turn around the logical direction of the trunk. DCS trunk turnaround is permitted, when some other party involved in the call (at the remote switch) can provide disconnect supervision.

Without OTTOTT or DCS, a conference involving two or more outgoing trunks is permitted only when at least one remaining conference party is an attendant, incoming trunk, or station.

## Considerations

---

- OTTOTT is not intended for use in DCS networks, since DCS Trunk Turnaround provides comparable capabilities much more safely. However, use of OTTOTT with DCS is not prohibited, and may be useful when one or more of the trunks goes off the DCS network.

## Security Measures

---

### SECURITY ALERT:

*You are cautioned that this feature can be used to transfer an outside party to a trunk over which toll calls might be made. Since trunks have to be specifically administered for OTTOTT, you should examine the Class of Restriction (COR) and Facility Restriction Level (FRL) of that trunk group to determine if they are appropriate.*

### SECURITY ALERT:

*OTTOTT is not a system-wide parameter. It is administered on a trunk-group basis. You must enable Trunk-to-Trunk Transfer on the Feature-Related System Parameters form for this feature to work. If you deem that the feature is not relevant to your business practices, do not enable it. Alternately, if a temporary need presents itself, you can temporarily enable this feature and then turn it off.*

## Interactions

---

### ■ DCS Trunk Turnaround

OTTOTT increases the set of cases in which DCS Trunk Turnaround may be accepted. However, use of OTTOTT in combination with a DCS network is strongly discouraged. The following algorithm describes the DCS Trunk Turnaround request process.

- a. If any party on the call receives a local-dial, busy, intercept, or reorder tone, deny turnaround.
- b. If any remaining party is an answered station or attendant, accept turnaround.
- c. If any remaining party is on an incoming trunk, accept turnaround. For the purposes of this check, an outgoing DCS trunk that has been turned around an odd number of times via a DCS trunk turnaround is considered an incoming trunk with disconnect supervision. Similarly, an incoming DCS trunk that has been turned around an odd number of times is considered an outgoing trunk.
- d. If any remaining party is an outgoing trunk administered for OTTOTT that has received answer supervision, accept turnaround.
- e. If any remaining party is an outgoing DCS trunk, forward the turnaround request.
- f. Otherwise, deny turnaround.

### ■ Incoming Disconnect Supervision

Outside of the U.S., incoming disconnect supervision is a switch capability that restricts transfers or conferences for certain incoming trunks. In the U.S., all incoming trunks are assumed to provide disconnect supervision. In some countries this assumption is not valid, so administer whether or not an incoming trunk provides disconnect supervision for each trunk group.

### ■ Personal Central Office Lines

Transfer of personal CO lines (PCOLs) is not subject to the normal restrictions applied to transfer of other trunks. These transfers are allowed since the PCOL appearance remains on one or more stations as a feature button. System users must be aware that the DROP button cannot be used to disconnect the transferred-to party from the call. Hence, if an outgoing PCOL is transferred to an outgoing trunk and neither of the trunks can supply a disconnect signal, the two trunks lock up.

### ■ QSIG Global Networking

If either call is over an ISDN-PRI trunk administered with Supplementary Service Protocol b (QSIG), additional call information may display.

#### 4 Basic Features

##### Transfer — Outgoing Trunk to Outgoing Trunk

Page 4-602

- Release Link Trunks

RLTs are used by Centralized Attendant Service (CAS). An outgoing RLT at a remote branch is used to access an attendant at the main. The attendant at the main can transfer the incoming caller to a station or trunk at the branch. The RLT is typically used only for a short period of time and is usually idled after the transfer is established.

A station at a branch can transfer an outgoing trunk to the attendant at the main. This transfer could be viewed as an OTTOTT (the attendant is accessed via an outgoing RLT). Since administering outgoing disconnect supervision for RLT trunks provides no additional capability, this administration is not provided for RLT trunks.

- Restriction

Restrictions on the transferring party may block a transfer or drop operation even when Outgoing Disconnect Supervision is provided.

- Trunk-to-Trunk Transfer

If this feature-related system parameter is set to restricted, all trunk-to-trunk transfer/release/drop operations for public trunks (CO, CPE, CAS, DID, DIOD, FX, and WATS) have calls terminated or receive denial. If the parameter is set to none, all trunk-to-trunk transfers (except CAS and DCS) have calls terminated or receive denial.

Hence, this option must be set to all to enable OTTOTT operation for these types of trunks. The number of public-network trunks allowed on a conference call is administrable. This number defaults to 1, so if OTTOTT is being used to connect two or more public network trunks, you must increase this limit on the Feature-Related System Parameters form.

- Trunks (CO, FX, and WATS)

You cannot have two CO, FX, or WATS trunks in a OTTOTT connection, even if `Disconnect Supervision - Out` is set to **y**.

## Trunk Flash

---

Trunk Flash allows a feature or function button on a multifunction voice terminal or attendant console to be assigned as a Flash button. Pressing this button while connected to a trunk (which must have been administered to allow trunk flash) causes the System to send a flash signal out over the connected trunk.

Trunk Flash enables multifunction voice terminals to access central office customized services that are provided by the far-end or Central Office (CO) located directly behind the DEFINITY System. These central office customized services are electronic features, such as conference and transfer, that are accessed by a sequence of flash signal and dial signals from the DEFINITY System station on an active trunk call. The Trunk Flash feature can help to reduce the number of trunk lines connected to the DEFINITY switch by:

- Performing trunk-to-trunk call transfers at the far-end or CO, which eliminates the use of a second trunk line for the duration of the call and frees the original trunk line for the duration of the call.
- Performing a conference call with a second outside call party, which eliminates the need for a second trunk line for the duration of the call.

**NOTE:**

Some analog Dual-Tone Multi-Frequency (DTMF) telephone sets used in Italy and the United Kingdom are equipped with a FLASH button that, when pressed, generates a rotary digit 1. When an analog station which is administered as a DTMF station (for example, as a 2500 or 71nn-type station) transmits a rotary digit 1, the system treats the signal as a recall signal from the station set to the DEFINITY ECS.

### How to administer Trunk Flash

---

#### Required forms

| Form                             | Field               | Page                  |

| Trunk Group                        | ■ All |                       |
| — CO                               |       | <a href="#">7-168</a> |
| — FX                               |       | <a href="#">7-193</a> |
| — WATS                             |       | <a href="#">7-268</a> |
| — Tie (for digital TN464 & TnN767) |       | <a href="#">7-262</a> |

**Detailed description**

When used by a Centralized Attendant Service (CAS) attendant connected to an Release Link Trunk (RLT), the flash controls certain CAS features at the branch. When used by a multifunction voice terminal or non-CAS attendant connected to a CO, FX, or WATS trunk, the flash controls certain features (such as add-on) at the connected CO.

Trunk Flash is not available on Personal Central Office Line (PCOL) groups.

The system supports the Trunk Flash signal for incoming, outgoing, or 2-way call directions on selected 2-wire analog (ground-start or loop-start) or digital (DS1) trunks or Tie trunks on DS1.

If the trunk group is a DS1 trunk in Italy, the Trunk Flash feature applies only to outgoing calls.

This feature may also be activated by dialing the Trunk Flash FAC as administered on the Feature Access Codes form.

When a system user presses the Trunk Flash (Flash) button, the call can involve only one trunk line. This trunk must have been administered with Trunk Flash.

If the trunk is not directly connected to the far end or CO providing the customized services, use of the Trunk Flash signal may cause the call to be disconnected by the far end or CO.

Calls made after the Flash are not recorded in Call Detail Recording (CDR) records.

## Considerations

---

### NOTE:

The Trunk Flash feature allows the station user to receive central office dial tone, and place a call that is not monitored by the DEFINITY system, and is not subject to restrictions (toll, FRL, COR, etc.). Therefore you should enable this feature with caution.

- A Trunk Flash button can be assigned on CAS attendant consoles, non-CAS attendant consoles, and multifunction stations. For CAS attendants, use of this button is limited to certain CAS features via RLT trunks. For multifunction and non-CAS attendant consoles, this button is used for the Trunk Flash feature.
- FAC activation of the trunk flash feature is allowed.
- The Flash button is used by the Trunk Flash and CAS features.
- System features (such as internal conference call, transfer, and call park) may be combined with custom services (that is, CO-based features that are activated/controlled by sending a flash signal over the trunk to the CO). However, mixing DEFINITY ECS features with custom services causes complications for the user when tracking a call. DEFINITY Systems cannot give the local station user status information on the custom services.
- The Trunk Flash feature may only be accessed if the call has only one trunk, the trunk must be outgoing from the PBX's perspective, and the trunk group of that trunk has Trunk Flash enabled. The Trunk Flash feature is disabled when the call involves more than one trunk, even if all the trunks have Trunk Flash enabled.
- Any DEFINITY ECS station can flash and dial a FAC to access the Trunk Flash feature; any DEFINITY ECS station with a flash button can access the Trunk Flash feature by hitting the flash button. The system allows as many as five stations to participate in a conference call with the trunk line party. However, to access the Trunk Flash feature, at least one of the stations must have a Flash button.

- In a call involving more than one station, one of the stations may press the Flash button, and another station may dial the phone number. The station that dials the phone number is not required to have a Flash button.
- If the far-end/CO does not support custom services, the call may be dropped by the far-end/CO on sending the flash signal or the signal may be ignored and a click-click sound is heard.

## Interactions

---

None.

## Trunk Group Busy/Warning Indicators to Attendant

---

Trunk Group Busy/Warning Indicators to Attendant provides the attendant with a visual indication that the number of busy trunks in a group is reaching an administered level.

### How to administer Trunk Group Busy/Warning Indicators to Attendant

---

#### Required forms

| Form              | Field                               | Page                  |

| — Tie             |                                     | <a href="#">7-262</a> |
| — WATS            |                                     | <a href="#">7-268</a> |

#### Detailed description

---

The feature also provides a visual indication when all trunks in a group are busy.

The two lamps that provide the visual indications are:

- Warn Lamp

Located on Trunk Hundreds Select buttons that have three lamps. The lamp lights when a preset number (warning threshold) of trunks in the associated trunk group are busy.

**4 Basic Features**

*Trunk Group Busy/Warning Indicators to Attendant*

*Page 4-608*

- **Busy Lamp**

Located at each of the 12 Fixed Trunk Hundreds Select buttons and on each feature button administered as a Trunk Hundreds Select button. The lamp lights when all trunks in the associated trunk group are busy.

- The indicators are particularly useful when you are providing Attendant Control of Trunk Group Access.

## **Interactions**

---

- **Loudspeaker Paging Access**

Trunk Group Busy Indicators allow attendants to see whether paging zones are busy or idle.

## Trunk Identification by Attendant

---

Trunk Identification by Attendant allows an attendant or display-equipped voice-terminal user to identify the trunk used on a call.

### How to administer Trunk Identification by Attendant

---

#### Required forms

---

| Form                   | Field                                    | Page                 |
|------------------------|--|----------------------|
| Attendant Console      | ■ Feature Button Assignments<br>— trk-id | <a href="#">5-35</a> |
|                        | ■ Display Language                       |                      |

---

#### Detailed description

---

Use this feature when a user is on one of the following established trunk calls:

- An incoming trunk call
- An outgoing trunk call
- A transferred or conferenced call involving a trunk
- A trunk-to-trunk call

Use the Trunk ID button during an established call, while seizing a trunk, while outpulsing digits on a trunk, or during intervals between digit outpulsing.

When you connect a user to a trunk, and press the Trunk ID button, the trunk displays. The trunk ID consists of the 1–4 digit trunk-access code for that trunk group and the 3-digit trunk-group member number.

The trunk ID that is displayed depends on the type of call in process. If the call is incoming, the incoming trunk ID displays. If the call is outgoing, the outgoing trunk ID displays. If the call is trunk-to-trunk, the last trunk added to the call displays.

## Considerations

---

- This feature is particularly useful for identification of a faulty trunk. That trunk can be removed from service and the problem quickly corrected.
- Allow a maximum of one Trunk ID button per attendant and voice-terminal with a display.
- The feature is denied if there are more than two trunks on the call or if there are exactly two trunks on the call and the station pressing the Trunk ID button is not the controlling party.
- When a conference results from an incoming call followed by an outgoing call, the last trunk added to the conference is the incoming one.

## Interactions

---

- Attendant Display and Voice Terminal Display

Any action by the user or the system that changes the display removes the trunk ID currently displayed. The Trunk ID button lamp remains lighted as long as the call is active. When the lamp lights, the user can use the associated button to redisplay the trunk ID.

If the Trunk ID button is pressed during a call origination (before all digits are dialed), the trunk ID appears. On a voice terminal-display, any subsequently dialed digits do not display. On an attendant display, the subsequently dialed digits overwrite other digits on the display.

- Busy Verification

A trunk being busy-verified can be identified.

- Hold

A trunk held by a user cannot be identified.

## Trunk-to-Trunk Transfer

---

Trunk-to-Trunk Transfer allows the attendant or voice-terminal user to connect an incoming trunk call to an outgoing trunk.

### **SECURITY ALERT:**

*Trunk-to-trunk transfer poses a significant security risk. Use this feature only with extreme caution.*

## How to administer Trunk-to-Trunk Transfer

---

### Required forms

---

| Form                              | Field                   | Page                  |
|-----------------------------------|-------------------------|-----------------------|
| Feature-Related System Parameters | Trunk-to-Trunk Transfer | <a href="#">5-123</a> |

The system provides three levels of administration for this feature: system-wide, COR-to-COR, and COS.

To administer Trunk-to-Trunk Transfer system-wide, complete the Feature-Related System Parameters form. To restrict Trunk-to-Trunk Transfer on a trunk-group basis, assign COR-to-COR calling-party restrictions on the Class of Restriction (COR) form. To allow individual users to control Trunk-to-Trunk Transfers, assign capabilities on the Class of Service (COS) form.

## Considerations

---

- Trunk-to-Trunk Transfer is particularly useful when a caller outside the system calls a user or attendant and requests a transfer to another outside number. For example, a worker, away on business, can call in and have the call transferred elsewhere.
- Transferred trunk calls can be administered to receive either music or silence.
- Some central office (CO) trunks do not signal the PBX when the CO user disconnects from a call. The system ensures that incoming CO trunks without Disconnect Supervision are not transferred to outgoing trunks or to other incoming CO trunks without Disconnect Supervision.
- An attendant-assisted call connecting an outgoing trunk or incoming trunk without Disconnect Supervision to an outgoing trunk must be held on the console. The system does not allow the attendant to release the call. The attendant can, however, use the Forced Release button and disconnect all parties associated with the call.

- If a voice-terminal user has connected two outgoing trunks or an outgoing call and an incoming call without Disconnect Supervision, the user must remain on the call. Otherwise, the call is dropped. An incoming trunk with Disconnect Supervision can be connected to an outgoing trunk without the user remaining on the call. An incoming trunk can also be connected to another incoming trunk without the user remaining on the call if one of the incoming trunks has Disconnect Supervision.

## Interactions

---

- Attendant Lockout  
Attendant Lockout does not function on Trunk-to-Trunk Transfer.
- Call Vectoring  
Station control of Trunk-to-Trunk Transfer does not affect routing of incoming trunks to a VDN that ultimately routes to a destination off-net.  
A route to a number off the switch does *not* require you to enable trunk-to-trunk transfer.
- Tenant Partitioning  
Station control of Trunk-to-Trunk Transfer is prohibited between trunks in different tenant partitions if those partitions are restricted.

## Visually Impaired Attendant Service

---

Visually Impaired Attendant Service (VIAS) allows a visually-impaired attendant to listen to voiced information about each button in Inspect mode.

### How to administer VIAS

---

#### Required forms

---

| Form              | Field  | Page                 |
|-------------------|--|----------------------|
| Attendant Console | <ul style="list-style-type: none"><li>■ Feature Button Assignments VIAS Act/Deact<ul style="list-style-type: none"><li>— console</li><li>— display</li><li>— dtgs-stat</li><li>— last-mess</li><li>— last-op</li></ul></li></ul> | <a href="#">5-35</a> |

---

### Detailed description

---

VIAS provides voice feedback to a visually-impaired attendant in either Italian or British English.

The six VIAS attendant buttons are:

- Visually Impaired Service Activation/Deactivation button: activates or deactivates the feature. All ringers previously disabled (for example, recall and incoming calls) become reenabled.
- Console Status button: voices whether the console is in Position Available or Position Busy state, whether the console is a night console, the status of the attendant queue, and the status of system alarms.
- Display Status button: voices what is shown on the console display. VIAS support is not available for all display features (for example, class-of-restriction information, personal names, and some call purposes).
- Last Operation button: voices the last operation performed.
- Last Voiced Message button: repeats the last voiced message.
- Direct Trunk Group Selection Status button: voices the status of an attendant-monitored trunk group.

The attendant presses the Inspect mode to locate each button and then presses a feature button to determine the feature assigned to the button without actually executing the feature. To end Inspect mode, the attendant presses the Normal button.

## Considerations

---

- Some changes on the attendant console automatically voiced (for example, alarms reported, night service activated, and call thresholds reached).
- VIAS does not automatically activate after system initialization. After a warm restart operation, VIAS remains activated if already activated. After recovery and cold restart operations, VIAS does not automatically activate even if already activated. Finally, whenever the attendant console goes to a busyout state and VIAS activates, VIAS automatically deactivates.

## Interactions

---

- Auto Start — Is always enabled when VIAS activates.
- Don't Split — The attendant can activate Don't Split as usual. The Don't Split automatically deactivates when the attendant deactivates VIAS.

## Voice Message Retrieval

---

Voice Message Retrieval allows attendants, voice-terminal users, and remote-access users to retrieve Leave Word Calling (LWC) and Call Coverage messages.

### How to administer Voice Message Retrieval

---

#### Required forms

---

| Form                              | Field  | Page                  |

|                                   | ■ Message Waiting Lamp Indicates Status For      |                       |
| Station                           | ■ Security Code                                  | <a href="#">6-28</a>  |

### Detailed description

---

Voice Message Retrieval is used only for the retrieval of messages. It can be used to retrieve a user's own messages or messages for another user. However, a different user's messages can be retrieved only by a user at a voice terminal or attendant console in the coverage path, by an administered system-wide message retriever, or by a remote-access user when the extension and associated security code are known.

The system restricts unauthorized users from retrieving messages. The Lock function restricts a voice terminal and the Unlock function releases the restriction. Users activate Lock by dialing a system-wide access code. They cancel Lock by dialing a system-wide access code and then an Unlock security code unique to the voice terminal. These functions apply only to the voice terminal where the function is active. The system-wide access codes and security code used for the Lock and Unlock functions are the same as those used for LWC message retrieval by display. You can assign a status lamp to show the lock status of the voice terminal.

## End-user procedures

Voice Message Retrieval is activated as follows:

- To retrieve your own messages:  
Dial the access code for Voice Message Retrieval of LWC messages. Then dial # to indicate the dialing extension, or enter a specific extension and corresponding password (same as the security code used for the Lock and Unlock functions).
- To retrieve someone else's messages:  
Dial the access code for Voice Message Retrieval of Call Coverage messages, then dial the extension of the user (within the same coverage path) whose messages are to be retrieved.

Users can get out of Voice Message Retrieval mode by:

- Hanging up
- Pressing the Drop or Disconnect button
- Activating CALL

## Considerations

- When a terminal is in Voice Message Retrieval mode, it cannot be used to make calls or access other features.
- Voice Message Retrieval cannot be accessed from rotary voice terminals.
- Certain voice terminals and attendants can be designated for system-wide message retrieval. These system-wide retrievers are the same as those used for Display Message Retrieval and have the same privileges.
- The number of simultaneous Voice Message Retrieval users possible depends on the number of speech-synthesizer circuit packs used in the system.

## Interactions

- AUDIX Interface  
Retrieval of LWC messages via Voice Message Retrieval is separate and distinct from retrieval of messages via INTUITY. LWC messages left for a principal on AUDIX may not be accessed via Voice Message Retrieval; however, the caller of Voice Message Retrieval is told if there are any new messages for the principal on AUDIX:
  - Voice Message Retrieval voices that there are AUDIX messages.
  - The Display Message Retrieval displays "Message Center AUDIX Call."

If your system has a voice-synthesizer circuit pack and LWC Activation is active, users can retrieve messages from two locations:

- Users can retrieve LWC messages with Voice Message Retrieval.
- Users can retrieve all other messages with AUDIX.

If you do not have a TN725B speech-synthesizer board, then non-display voice-terminal users cannot retrieve LWC messages that were sent via the LWC button on a voice terminal.

■ Bridged Call Appearance

Voice Message Retrieval on a Bridged Call Appearance functions the same as if it were activated by the primary extension associated with the bridged call appearance.

■ Leave Word Calling

Voice Message Retrieval enhances LWC by allowing any authorized touch-tone voice-terminal user to retrieve messages.

## Voice Messaging Systems

---

DEFINITY ECS supports several Lucent voice or multimedia messaging systems. These systems let users send, get, store, and forward messages, as well as perform many other tasks associated with messages. The systems DEFINITY ECS supports are:

**INTUITY AUDIX** INTUITY AUDIX runs on a separate MAP/5, MAP/40, or MAP/100 PC. The switch communicates with INTUITY AUDIX over analog voice ports and a data link. The switch can also communicate with INTUITY AUDIX without the data link. In this case, the switch and INTUITY AUDIX communicate by sending and receiving special strings of touch-tone codes (dual tone multifrequency tones) over the analog voice ports. These touch-tone codes are called *mode codes* and carry data such as calling party ID, called party ID, and type of call.

### NOTE:

If your system is a DEFINITY ECS R6csi (compact modular cabinet) or later, you must use the mode code integration with Intuity AUDIX.

INTUITY AUDIX allows up to 64 ports. This means up to 64 people can be simultaneously getting or leaving messages. INTUITY AUDIX also supports fax and e-mail messaging.

For more information, see *INTUITY AUDIX System Description* or *INTUITY AUDIX Administration*

**DEFINITY AUDIX** DEFINITY AUDIX runs on a TN 566 or TN567 circuit pack assembly. This assembly, called a multifunction board, fits into 5 contiguous slots in the DEFINITY switch. DEFINITY AUDIX communicates with the switch over analog voice ports with a data link. DEFINITY AUDIX can also communicate exclusively over analog voice ports when set up to emulate a digital phone set.

DEFINITY AUDIX allows up to 16 ports.

For more information, see *DEFINITY AUDIX System Feature Descriptions*, *DEFINITY AUDIX System Administration*, or *DEFINITY AUDIX System Forms Reference*

Other non-Lucent messaging systems may also use mode codes to work with DEFINITY ECS.

**How to administer the switch for voice messaging**

A service technician typically completes the initial installation and set up of your messaging system. However, the procedures on how to administer the switch for voice messaging are fully described in one of the following documents:

- For INTUITY      *INTUITY Integration with System 75 and DEFINITY*  
AUDIX            *Communications System Generic 1 and Generic 3,*  
                      585-310-214, Issue 6
  
- For DEFINITY    *Switch Administration for the DEFINITY AUDIX System,*  
AUDIX            585-300-509, Issue 6
  
- For AUDIX R1    *Switch Administration for AUDIX Voice Messaging,*  
                      585-305-505

**How to administer voice messaging for a DCS configuration**

See [“Distributed Communications System” on page 12-11](#) for a listing of required forms.

**Security Measures**

 **SECURITY ALERT:**

*Fraudulent long-distance calls can be placed through INTUITY AUDIX, DEFINITY AUDIX, and AUDIX R1 if proper security precautions are not implemented.*

The following actions help secure your system from unauthorized use.

- For INTUITY AUDIX, DEFINITY AUDIX, and AUDIX R1
  - To help prevent exchange of information through unassigned Voice Mail, remove any unused or unassigned mail.
  - Secure system lines that serve AUDIX and control where calls can be placed. Pay special attention to assigning restrictive COR, COS, and FRL to the station lines and trunks serving AUDIX. Use switch CDR reports to determine if the lines are being used for calls that are normally not within your sphere of business.
  - Change default passwords on voice mailboxes immediately after installation and use random numbers for passwords.
  - Require passwords with at least 5 digits.
  - Change system administration passwords to alphanumeric codes.
  - INTUITY AUDIX, AUDIX R1, and DEFINITY AUDIX provide a maintenance/administration port. A remote port security device provides an added layer of security to prevent unauthorized access to this port.
- For INTUITY AUDIX and DEFINITY AUDIX
  - Determine whether to allow transfers only to other AUDIX subscribers or to any extension of the correct length. The most secure approach is to allow transfers only to other AUDIX subscribers. If you decide to allow transfers to any extension, administer the COR on the AUDIX ports to prevent calls outside the PBX or immediate DCS site network.
- For AUDIX only
  - To help prevent having billable calls placed from unauthorized transfers outside of the system, activate Enhanced Call Transfer (ECT). ECT performs call transfer over the data link between AUDIX and the DEFINITY ECS. (The destination extensions must be administered on the switch dial plan.)

## Considerations

- In addition to supporting multiple AUDIX systems, DEFINITY can have multiple hunt groups associated with a single AUDIX system. This allows partitioning of the voice ports into different hunt groups and different coverage paths to cover different voice ports. Thus voice ports can be reserved for particular users or groups of users (for example, those that use particular coverage path).

- The following features do not use coverage paths:
  - Transfer into AUDIX with the feature access code or the GOTO COVER button
  - Last Call
- If a local AUDIX and a remote AUDIX use the same hunt-group numbers, calls route to the local hunt group.

## Interactions

---

- Attendant Conference

An attendant who has split a call can conference the call with AUDIX by dialing the Transfer Into AUDIX access code. The attendant presses Release to drop out of the conference call.
- Automatic Call Distribution (external AUDIX only)

You can administer a hunt group as an AUDIX ACD split. You can then obtain AUDIX traffic measurements with the ACD Call Management System. Login occurs when AUDIX signals the switch to make a voice port available for AUDIX service. Logout occurs when AUDIX signals the switch to disable the port.

AUDIX and ACD CMS must be connected to the same switch. If AUDIX in the DCS feature is active, a CMS located on a switch other than the host switch (AUDIX location) does not provide measurements for the AUDIX ports.

Because AUDIX frequently takes voice ports in and out of service for maintenance testing, high login activity may be seen for the AUDIX split in the measurement reports.

On CMS reports that display an agent's login ID, AUDIX voice ports always show a login ID that is the same as the extension, even if you have not administered login IDs on the switch.
- Call Coverage

When a coverage call successfully completes to AUDIX or routes from a remote switch to the host switch because of coverage, the principal is dropped from the call (no temporary bridge appearance is maintained).

Coverage calls from a remote switch that fail to reach AUDIX as a coverage point cannot be returned to the original coverage path on the remote switch.
- Call Forwarding

An AUDIX user can forward calls to a remote AUDIX hunt group or to the host AUDIX hunt group. You must correctly administer the AUDIX destination for the remote AUDIX hunt group.

- Call Monitoring

Call Monitoring allows users to pick up the handset after the call goes to AUDIX to listen to the message being left by the caller. This allows the user to determine whether they want to talk to the caller or let them complete their message.

- Call Transfer

A call transfer out of AUDIX can be to a UDP extension. If the UDP extension is on a remote switch, the call is treated as a direct call. Additional trunks are used for calls transferred between DCS nodes.

Calls may be transferred into AUDIX by users handling redirected calls for principals who are AUDIX subscribers.

- Class of Restriction

A high FRL assigned in the COR allows callers to transfer to long-distance numbers.

To prevent toll fraud, assign a low FRL to the AUDIX system ports.

- DCS — Leave Word Calling (external only)

In a DCS network, the called party may be on a different switch than the calling party. If the DCS link is down, attempts to store Leave Word Cancel messages are denied and intercept tone is returned. LWC requests are always denied for principals with AUDIX LWC; in some instances, the request to cancel LWC may appear to be active when it actually is not (see [“Leave Word Calling” on page 4-405](#)).

When the local switch communicates with INTUITY AUDIX via mode codes, INTUITY AUDIX cannot support remote DCS switches.

- Facility Test Call

Unauthorized calls can be placed using the facility test-call access code.

To prevent toll fraud, remove the facility test call access code.

- Leave Word Calling

You can have a principal's LWC messages kept by AUDIX. The principal can retrieve a message by calling AUDIX. The principal cannot retrieve the message using other retrieval methods, but is notified of its existence by AUDIX.

For other messaging services, you can have AUDIX report the existence of waiting LWC messages for the principal, but not the message content. The principal can retrieve the message using other retrieval methods, but is still notified of the existence of AUDIX messages.

If the data link between the system and AUDIX is down, attempts to activate LWC for an AUDIX-covered principal are denied and reorder tone is returned.

If a caller attempts to cancel a LWC message sent to AUDIX, the caller receives intercept tone if the called party is on the same switch. The caller receives confirmation tone if the called party is on another switch in the DCS network as long as the DCS data link to the called party's switch is operational, even though the message is not actually canceled.

When the local switch communicates with INTUITY AUDIX via mode codes, INTUITY AUDIX does not accept or store LWC messages in user mailboxes.

- Ringback Queueing

Ringback Queueing does not apply to AUDIX calls. On direct calls to a remote AUDIX, if all trunks to the host AUDIX are busy, busy tone is returned. On coverage calls, if all trunks are busy, AUDIX is treated as a busy coverage point. If there are coverage points after AUDIX, then the call terminates at those points.

- Single-Digit Dialing and Mixed-Station Numbering

AUDIX is designed for use with a Uniform Dial Plan. It supports only one extension length (3-, 4-, or 5-digit) that is used by AUDIX subscribers. Single-Digit and Mixed Station Numbering cannot be used. However, nothing prohibits connecting a switch to AUDIX that provides these features, as long as all AUDIX subscribers have the same extension length.

- Temporary Bridged Appearance

Stations that normally have a temporary bridged appearance with their coverage point do not have that appearance if the coverage point is AUDIX.

## Voice Terminal Alerting Options

---

Voice Terminal Alerting Options provide a range of audible ringing treatments for digital and hybrid multiappearance voice-terminals calls to off-hook and active/idle CALLMASTER voice terminals.

### How to administer Voice Terminal Alerting Options

---

#### Required forms

---

| Form   | Field                    | Page                 |
|--|--------------------------|----------------------|
| Station<br>(Digital, Hybrid, and CALLMASTER) | ■ Active Station Ringing | <a href="#">6-28</a> |

---

### Considerations

---

- Voice Terminal Alerting Options do not affect ringing to on-hook terminals. These terminals always ring audibly until the call is answered, redirected, or abandoned.
- This option is not available with analog voice terminals, multibutton electronic telephones (MET), and ISDN-BRI voice terminals.

### Interactions

---

- Bridged Call Alerting  
Bridged call appearances ring audibly when a call is directed to that station. The audible alerting applied to the station is determined by the Voice Terminal Alerting Option that you administered on the station that is ringing.
- Distinctive Ringing  
A system can still be administered for Distinctive Ringing.
- Priority Calling  
When the Voice Terminal Alerting Option is set to audible ringing, priority calls still receive distinctive audible alerting.
- Ringing — Abbreviated and Delayed  
When you enable per-button ring control, this feature is disabled.

## Voice Terminal Display

---

Voice-terminal displays provide multiappearance voice-terminal users with updated call and message information. The information displayed depends upon the display mode selected by the user. Users may also select any of the following as the display language: English (default), French, Italian, Spanish, or user-defined.

This feature provides an instant display of information associated with certain system features, functions, and services. Information that allows personalized call answering is available on many calls. Retrieving stored information, such as messages and directory information, is easy as well as convenient.

### How to administer voice terminal displays

---

#### Required forms

---

| Form                                      | Field   | Page                 |
|---|---|----------------------|
| Station (7400D and 8400D voice terminals) |   | <a href="#">6-90</a> |
| — Station page                            | <ul style="list-style-type: none"> <li>■ Data Module</li> <li>■ Display Module</li> <li>■ Display Language</li> </ul> |                      |
| — Data Module page                        | <ul style="list-style-type: none"> <li>■ All</li> </ul>   |                      |
| — Display Module page                     | <ul style="list-style-type: none"> <li>■ All</li> </ul>   |                      |

### Detailed description

---

You can assign several modes to buttons. Users access these modes by pressing the assigned button on the display module or voice terminal. All buttons are administrable.

- Normal mode

Displays call-related information for the active call appearance. This display includes information identifying the call appearance, calling- or called-party name, and calling or called number, depending on the type of call.

Elapsed Time is a display feature that can be invoked anytime the display is in Normal mode. It displays elapsed time in hours, minutes, and seconds. Timing starts or stops when the button is pressed.

- Inspect mode

Displays call-related information for an incoming call when the user is active on a different call appearance.

- Stored Number mode

Displays one of the following numbers:

- The last number that the user dialed (Last Number Dialed)
- The number stored in an Abbreviated Dialing button administered to the voice terminal
- A number stored in an Abbreviated Dialing list
- A number assigned to a button that was administered via Facility Busy Indication

- Date and Time mode

Displays the current date and time of day.

- Integrated Directory mode

Turns off the touch-tone signals and allows the user to use the touch-tone buttons to enter the name of a system user. After a name is entered, the display shows the name and extension.

Integrated Directory can use 1 additional button:

- Call-Disp  
Automatically returns the call requested by the currently-displayed message or the currently-displayed name and extension.

- Message Retrieval mode

Retrieves messages for voice-terminal users. If no messages are stored, display shows `NO MESSAGES`. Messages can be retrieved even if the retriever is active on a call.

Message Retrieval can use 3 additional related buttons:

- Next Message  
Retrieves the next message or displays `END OF FILE, PUSH Next TO REPEAT` when in Retrieval mode.
- Delete  
Deletes the currently displayed message.
- Call-Disp  
Automatically returns the call requested by the currently-displayed message or the currently-displayed name and extension.

- Coverage Message Retrieval Mode

Retrieves messages for voice-terminal users who do not have a display module assigned to their voice terminal. You must administer retrieval permission for a user to be able to retrieve another user's messages. The retriever does not need to lift the handset to retrieve messages. Messages can be retrieved even if the retriever is active on a call.

Coverage Message Retrieval can use 3 additional related buttons:

— Next Message

Retrieves the next message or displays `END OF FILE, PUSH Next TO REPEAT` when in Retrieval mode.

— Delete

Deletes the currently displayed message.

— Call-Disp

Automatically returns the call requested by the currently-displayed message or the currently-displayed name and extension.

DEFINITY ECS provides the following call-related information:

■ Call Appearance Identification

The call appearance buttons are designated on the display by a lowercase letter. The display shows `a=` for a call incoming on the first button, `b=` for a call incoming on the second button, and so on.

■ Calling Party Identification

When a call is from inside the system, the display shows the caller's name or a unique identification administered for the voice terminal being used, along with the calling party's extension. When the call is from outside the system, the display shows the trunk group name (such as CHICAGO) and the trunk access code assigned to the trunk group used for the call. If a user is active on a call, and receives a subsequent call the display automatically shows the identification of the subsequent caller for a few seconds, then automatically restores the display associated with the active call appearance.

■ Called Party Identification

On calls to a system user, the display shows the digits as they are dialed. After the dialing is complete, the display shows the called party's name and extension. If no name is accessed, the dialed digits are displayed.

On outgoing calls, the display shows the digits as they are dialed. After dialing is complete, the display shows the name and trunk access code assigned to the trunk group being called. Optionally on a trunk-group basis, the display can show only the dialed digits, not the trunk group name and trunk access code.

■ Call Purpose

This identifies the reason for an incoming call or a redirected call. (A normal incoming call is not identified by a call purpose.) The following identifiers may be displayed:

- b — Busy — The called voice-terminal user is active on a call, and has a temporary bridged appearance of the call.
- B — Busy — The called voice-terminal user is active on a call, and does not have a temporary bridged appearance of the call.
- c — Cover All — The called user has Cover All criteria assigned.
- callback — The call is an Automatic Callback call from the system.
- d — Coverage on Don't Answer — The call was redirected because the called voice terminal was not answered. Also indicates that the called voice-terminal user has a temporary bridged appearance of the call.
- f — Call Forwarding — Another user has forwarded calls to this voice terminal.
- h — Station hunt — The called voice-terminal user is active on a call and station hunt was used to route the call.
- ICOM — The call is an Intercom call.
- p — Pickup — The user answered a Call Pickup group member's call.
- park — The user parked a call.
- priority — The call has priority status.
- s — Send All Calls — The called user is temporarily sending all calls to coverage and the call has been redirected to this voice terminal.

## Considerations

- Certain voice terminals and the attendant group can be designated for systemwide message retrieval. Users of these voice terminals or consoles can retrieve Leave Word Calling (LWC) and Call Coverage messages for other voice-terminal users, including Direct Department Calling (DDC) groups, Uniform Call Distribution (UCD) groups, and Terminating Extension Groups (TEG). You can assign systemwide retrieving voice terminals or consoles on the Feature-Related System Parameters form.
- If the following conditions are met, messages for a voice-terminal user can be retrieved at selected terminals or any attendant console:
  - The retriever is in the user's Call Coverage path.
  - Permission to retrieve messages is assigned for the user's voice terminal.

- When all messages have been displayed and deleted for an extension, the Message lamp on the voice terminal and any associated Remote Message Waiting indicator, if assigned, go dark.
- Due to space limitations, some name displays are truncated to 15 characters. These include displays for transferred or covered calls, non-DCS ISDN-PRI call displays, VDN service observing displays, and when accessing Leave Word Calling messages or checking the queue status of an agent.

### Examples of Voice Terminal Displays

The following figures provide examples of typical voice terminal displays:

- Internal call

dialed digits

a=3602

then

a=TOM BROWN 3062

or, if no name is available

a=EXT 3602 3062

- Outgoing trunk call

b=87843541

Where 8 is the trunk access code and 784-3541 is the number dialed

then

b=OUTSIDE CALL 8

or

b=WATS 101

- Incoming trunk call

a=OUTSIDE CALL 102

Where 102 is the trunk access code of the incoming trunk group

- Conference call

b= CONFERENCE 4

Where 4 is the number of conferees, not including the conference-call originator

- Internal call redirected to coverage

b=EXT 3174 to EXT 3077 d

or

b=BOB SMITH to JOYCE THOMAS d

Where d indicates that Go To Cover is active for the calling user

- Incoming trunk call redirected to coverage

b=OUTSIDE CALL to DON SMITH s

Where s indicates that Send All Calls is active for the called user

- Message Retrieval

IN PROGRESS

then

MESSAGES FOR BETTY R. SIMS

then

JOE JONES 10/16 11:40a 2 CALL 3124

Joe Jones called Betty Sims at 11:40 a.m. on October 16. Joe wants Betty to call his extension, 3124.

- Integrated Directory mode

CARTER, ANN 3408 3

This display shows the name and extension. The 3 indicates that three buttons were pressed to reach this display.

## Interactions

---

- Bridged Call Appearance

A call from the primary extension or a bridged call appearance of the primary extension is displayed as a call from the primary extension.
- Last Number Dialed

If the Last Number Dialed feature access code is dialed after the stored number button is pressed, the last number dialed is not displayed. However, if the Last Number Dialed button is pressed after the stored number button is pressed, the last number dialed is displayed.
- Single-Digit Dialing and Mixed-Station Numbering

If prefixed extensions are used in the system's dial plan, the prefix is not displayed when the extension is displayed. The Return Call button can be used to dial prefixed extensions, because the system dials the prefix, even though it is not displayed.

## Whisper Page

---

Whisper Page allows station users to make and receive barge-in announcements to and from other station users without anyone else on the calls being aware of the announcements. The TN2182, TN768, or TN780 circuit pack must be administered. These station users must have an administered class of restriction (COR) that provides for intraswitch calling.

### How to administer Whisper Page

---

#### To administer a COR that provides for intraswitch calling

On the Station form, assign a COR that provides for intraswitch calling.

#### To administer an FAC for users who do not have feature buttons

On page 3 of the Feature Access Code form, assign a FAC in the `Whisper Page Activation Access Code` field.

Make sure the code conforms to the system-wide dial plan.

#### To administer a barge-in tone that is different from the default tone

##### NOTE:

You can only use a barge-in tone that is different from the default tone if you have the TN2182 or TN780 circuit pack administered. If you have the TN768 circuit pack administered, you must use the default tone. If you have a mixture of different tone/clock circuit packs in your system, you should not administer a barge-in tone that is different from the default tone.

1. On the first page of the System-Parameters form that has no tone assigned, enter **whisper page** in the `Tone Name` field.
2. Enter a tone frequency and level in the `Tone Frequency/Level` field.

You can press help to see available options.

#### To administer buttons

On the Station form, administer the new buttons.

## To administer user-defined language for displayed messages

If the displayed language is set to “user-defined” for any user in the system, change the translation for each “user-defined” message to the language that the user requests.

1. Enter **change display-messages self-administration** command to access the 3-page change display-messages self-administration form.
2. Change the translation for each “user-defined” message to the language that the user requests.

## Detailed description

---

You administer Whisper Page by assigning a FAC or programming a feature button with a lamp to the terminal. To activate Whisper Page, a user dials the FAC or presses the feature button, and then dials the extension of the user they are trying to reach.

- If the paged party is not busy, this Whisper Page activation is converted to a nondivertable priority station-to-station call. This priority call is labeled as nondivertable because all switch diversion features are overridden by this call. For example, if the station user has Call Forwarding — All Calls enabled, this nondivertable priority call still rings the dialed station in which “normal” priority calls follow the forwarding treatment of the station.
- If the paged party is busy, the paging party, the paged party, and all parties on the call hear a tone being played to announce the intrusion. After the tone is complete, the paging party is able to speak to the paged party only. The paging party is not heard by any other party, and the paged party is not able to hear any portion of the existing call. The paged party can ignore the page or choose to answer it.

The station forms for all the supported multifunction terminals need to include the new button types that are administrable on station buttons.

These new feature buttons are:

- Answerback -> “whisp -anbk”
- Whisper Page Activation -> “whisp -act”
- Whisper Page Off -> “whisp -off”

Any station user who anticipates receiving Whisper Pages may wish to be administered with a whisp-anbk button. Attendant consoles are only permitted to have the whisp-act feature button administered on the console, because they can never be recipients of Whisper Page.

An error message displays when administering whisp-off on a soft key. This button cannot be allowed to be administered on a softkey, because there is no simple means to remind the station user that the feature is active on the terminal.

An error message displays when someone attempts to administer any of these buttons on an unsupported terminal type or on any terminal where the G3 version is not set to V6 or greater.

A new tone type, Whisper Page Announce, allows customers to customize the tones to whatever they desire. This tone plays during the activation of the Whisper Page feature. It plays to all parties on the call, including the originator, to indicate that a page is occurring. The default tone is 440-Hz for a duration of 600 msec. There is a new keyword for the set of keywords for the `Tone Name` field. This keyword is "whisper-page."

Any station user who wishes to answer Whisper Pages can have an answerback feature button administered on their terminal. By pressing this button on the terminal, the paged party places the original caller on hold on the active call appearance, and automatically establishes a 2-way communication path with the paging party on another call appearance. The paged party can treat the paging party and the original call as two separate calls through standard call processing.

A station user can turn the Whisper Page feature off by pressing a Whisper Page Off button before call setup or during the call duration. You cannot administer this feature button on a softkey, and you program it on a feature button associated with a lamp. The lamp with this feature button indicates to the user when they are and are not available for "Whisper Pages" from other users.

The 6400-, 7400-, 8400-, and 9400-series DCP terminals support the use of the Whisper Page feature.

See *6400-Series Single-Line Telephone User's Guide* (555-230-738) and *6400-Series Multi-Line Telephone User's Guide* (555-230-739) for more information about user interactions.

## Interactions

---

- Attendant Auto-Manual Splitting  
If this feature is active against a specified station, any Whisper Page activation towards that station is denied.
- Attendant Display — 8 Character  
The display shows the extension number of the station that the attendant is paging.
- Attendant Display — 40 Character  
The display shows "Whisper to" and the name and extension of the station that the attendant is paging.

- Attendant Intrusion

If this feature is active against a specified station, any Whisper Page activation toward that station is denied. Also, when a Whisper Page is active on a station, Attendant Intrusion activation against that extension is denied. The attendant receives reorder tone and a lamp flutter when the feature is activated from a feature button.

- Attendant Override of Diversion Features

Whisper Page provides override capability for the following system-level diversion features:

- Call Forward All Calls
- Call Forward Busy
- Call Forward Don't Answer
- Send All Calls
- Go To Cover
- Call Coverage

In cases in which these features are active and the station user is not busy, the station rings with priority ringing. This is done to alert the primary extension owner to an important call.

In the case in which these features are active and the user is busy, Whisper Page operates normally.

- Automatic Incoming Call Display

The automatic incoming call display shows “Whisper to” and the name and extension of the station that the attendant is paging.

The following items indicate the required interactions with the incoming display when other display affecting features are enabled on the paged party's terminal:

- Bridged Call Appearance
  - Only the terminal designated as the principal extension owner is given the “Whisper from...” message.
- Conference Call
  - Only the member of the conference call that is paged receives the update to the display with the “Whisper from...” message. All other members of the conference call do not experience a screen update.
- Date/Time Display
  - For terminals that support 1- x40-character and 2- x24-character displays, the incoming string displays for a short period of time and then is rewritten with the date/time information. For terminals

supporting 2x40-character displays, the date/time information is relocated to the bottom right-hand portion of the screen, leaving the top line for incoming messages.

An incoming Whisper Page to an idle terminal is converted to a nondivertable priority call. The normal display information for priority calls prevails when providing display updates to the paged party.

— Elapsed Timers

On receipt of the “Whisper from ...” message, the timer is relocated to the lower right hand portion of the screen on the 2-line displays. Displays with only a single line keep the timer resident toward the end of the line and only allow the beginning characters of the display to present incoming messages.

— Integrated Directory, Stored Number Display, and Message Retrieval

The standard operation for normal incoming calls prevails in these cases. No new operation is defined. Stations with Auto-Inspect enabled allow the screen update to occur temporarily, and the switch returns the user to the previous function.

■ Bridged Call Appearance

The Whisper Page feature is intended to reach a specific station user associated with a given extension number. In the case of bridged call appearances, the owner of the extension also known as the primary extension owner is the intended recipient of the Whisper Page. Whisper Page activation causes tone to be played to all parties on the call and then the announcement to only the primary station if the primary station is already online. This case is similar to a simple 2-party or multiparty conference call.

In cases in which a station other than the one associated with the primary extension is using the bridged appearance, the Whisper Page rings the primary station user’s terminal with priority ringing. This is done to alert the primary extension owner to an important call.

In cases in which all stations associated with a bridged call appearance are idle, the primary extension owner’s extension rings with priority ringing and the display is that of a normal incoming priority call.

The display for an incoming Whisper Page at the primary extension owner’s terminal is the only terminal with that call appearance that receives the incoming display message. All other terminals with the bridged call appearance do not receive a screen update.

- Busy Verification of Terminals and Trunks

When Busy Verification of Terminals is in use against a specific extension, Whisper Page is blocked from usage by any other station user in the system. The opposite is true when Whisper Page is in use and another station user attempts to perform a busy verification of the same station extension.

- Calling Number Display

Calling number display is provided in the incoming Whisper Page display message.

- Call Pick-Up Groups

If a Whisper Page activation turns into a priority call at a station that is a member of a Call Pick-Up group, that call is able to be picked up by any member of that group.

- Character Voice Terminal Display

See [“Automatic Incoming Call Display” on page 4-636](#).

- Class of Restriction (COR)

A station user must have a COR that allows for station-to-station calling in order to perform Whisper Paging to a member outside of their own COR. Inbound/Outbound calling restrictions also determine which station users can make and receive Whisper Pages. The appropriate COR must also be in place to allow attendants and other users to perform interpartition Whisper Paging within a Tenant Partition environment.

- Conference

Whisper Page activation plays the barge-in tone to all parties on the conference call while only playing the subsequent announcement from the page initiator to the owner of the station that is being paged. Whisper Page origination is denied if the page is initiated towards a station with a conference that already has the maximum number of parties and trunks. This activation is denied to prevent degradation in voice quality within the conference call.

Additional parties cannot be added to a conference call if an active Whisper Page is on the call.

- Data Privacy — Permanent

Any station that has Data Privacy enabled at the time of activation is not available for a Whisper Page activation.

- Data Privacy — Temporary

Any station that has Data Privacy enabled at the time of activations is not available for a Whisper Page activation.

- Data/Time Terminal Display

See [“Automatic Incoming Call Display” on page 4-636](#).

- Direct Agent Calling Via Logical Agent ID

Whisper Page is not permitted to an Automatic Call Distribution (ACD) agent when the originator of the page uses the Whisper Page activate button followed by Direct Agent calling via Logical Agent ID. Whisper Page may only be permitted to ACD agents if the originator knows the physical extension.
- Direct Department Calling (DDC)

A Whisper Page attempt to an extension defined as a DDC extension is denied, because it is not possible to Whisper Page a group answering environment.
- Distributed Communication System (DCS)

This feature is not a DCS feature.
- Do Not Disturb

Any station user who has Do Not Disturb active on his or her station set is not available for Whisper Page terminations.
- Elapsed Timer

See [“Automatic Incoming Call Display” on page 4-636](#).
- Electronic Tandem Network (ETN)

This feature does not operate in the ETN environment.
- Flexible Language Display

See [“Automatic Incoming Call Display” on page 4-636](#).
- Go to Cover

A Whisper Pager origination is not canceled by pressing the Go to Cover button. Pressing the Go to Cover button while Whisper Page is being activated is ignored. The opposite is true as well. If a user has activated Go to Cover, pressing the Whisper Page activation button does not override the coverage treatment.
- Group Listen

The Group Listening feature, available on the 6400-series terminals, allows a user to use his or her handset for full-duplex communication while having their speakerphone turned on with the microphone muted. When this feature is active, any incoming Whisper Page is heard over both the handset and the speaker.
- Group Paging

See [“Group Listen” on page 4-639](#).
- Hunt Groups

A Whisper Page attempt to an extension defined as any type of hunt group extension is denied, because it is not possible to Whisper Page a group answering environment.

- Last Number Dialed  
Whisper Page activation is tracked as a last number dialed.
- Multilanguage Display  
See [“Automatic Incoming Call Display” on page 4-636](#).
- Priority Calling  
Whisper Page activation against a station that is not busy becomes a nondivertable priority call that is not subject to diversion treatment through any of the Call Forwarding features.
- Privacy — Attendant Lockout  
Whisper Page is denied at those stations in which the user has enabled the Privacy — Attendant Lockout feature.
- QSIG  
This feature does not operate in the QSIG environment.
- Send All Calls  
Whisper Page overrides a station user’s activation of Send All Calls. A Whisper Page activation is similar to a priority call, therefore, it ignores Send All Calls.
- Service Observing — Observe Agents or Non-Agents  
Whisper page is allowed if the paging party has paged the service observer or ACD agent by directly dialing the station extension and not an ACD number or vector directory number (VDN), the paged party must be on a supported set, and both the paging and paged parties must be on the same switch.
- Service Observing — Observe Analog Sets  
In this case, only the service observer can receive a Whisper Page if the observer is on a DCP set. The observed user on the analog set cannot receive a Whisper Page because the system does not allow Whisper Paging to analog sets.
- Service Observing — Observe Digital Sets  
Whisper Page is permitted if the originator of the page has paged the service observer or ACD agent by directly dialing the station extension and not an ACD number or VDN, the paged party is on a supported set, and the paging and paged parties are on the same switch.
- Service Observing — Observe Logical Agents IDs  
A Whisper Page to a Agent Logical ID is denied. A Whisper Page to the service observer is permitted if the service observer has been dialed directly, is on a supported terminal, and both the paging and paged parties are on the same switch.

- Service Observing — Observe Remote By FAC

Whisper Page is permitted if the originator of the page has paged the service observer or ACD agent by directly dialing the station extension and not an ACD number, VDN, or Logical Agent ID; and the paged party must be on a supported set. Both the paging party and the paged party must be local to the switch or the attempt is denied.

- Tenant Partitioning

Whisper Paging is permitted across tenant partitions if the CORs allow for intercom calling between members of different partitions. Attendants who serve multiple partitions make the most use of this feature. It is important for system administrators to make sure that this capability is managed appropriately so that tenants aren't barged-in upon by other tenants that should not have this functionality.

- Terminating Extension Group

Any Whisper Page activation against an extension associated with a Terminating Extension Group is denied because Whisper Page cannot be used in a group answering environment.

- Temporary Bridged Appearances

See [“Bridged Call Appearance” on page 4-637](#).

- Transfer

If a call has an active Whisper Page, the call cannot be transferred.

- Uniform Call Distribution (UCD)

A Whisper Page attempt to an extension defined as a UCD extension is denied, because it is not possible to Whisper Page a group answering environment.

- Voice Terminal Restrictions — Origination

This feature does not allow outbound call originations; therefore, Whisper Page is not allowed.

- Voice Terminal Restrictions — Termination

This feature does not allow inbound calls, therefore Whisper Page is not allowed.

## World-Class Tone Detection

---

World-Class Tone Detection allows DEFINITY ECS to identify and handle different types of call-progress tones. The tone detector and identification is used to display on Data Terminal Dialing and for deciding when to send digits on trunk calls through Abbreviated Dialing, ARS, AAR, and Data Terminal Dialing.

### How to administer World-Class Tone Detection

---

#### Required forms

---

| Form                                 | Field  | Page                  |
|--------------------------------------|--|-----------------------|
| System-Parameters<br>Country-Options | <ul style="list-style-type: none"> <li>■ Tone Detection Mode</li> <li>■ Dial Tone Validation Timer</li> <li>■ Outpulse Without Tone y/n</li> <li>■ Interdigit Pause</li> </ul> | <a href="#">5-271</a> |
| Feature-Related<br>System-Parameters | <ul style="list-style-type: none"> <li>■ Level of Tone Detection</li> <li>■ Off Premises Tone Detection Timeout</li> </ul>   | <a href="#">5-123</a> |

#### NOTE:

The Route Pattern form used with AAR and ARS allows entry of special characters + and! to indicate when to wait for a dial tone. The Abbreviated Dialing form allows entry of ~w and ~W for the same purpose. Configure World-Class Tone Detection to match the characteristics of the dial tone that is to be detected.

### Interactions

---

- Data Modules

Multiline Data Terminal Dialing is disabled if the Multiple-line Level of Tone Detection is **medium** or **broadband**. It is enabled if the Level of Tone Detection is **precise**.

## World-Class Tone Generation

---

World-Class Tone Generation allows you to define call-progress tones. You can select values for frequency and cadence. If you do not define a call-progress tone, DEFINITY ECS sends silence.

### How to administer World-Class Tone Generation

---

#### Required forms

---

| Form              | Field                    | Page                  |
|-------------------|--------------------------|-----------------------|
| System-Parameters | ■ Companding Mode        | <a href="#">5-271</a> |
| Country-Options   | ■ Analog Ringing Cadence |                       |
|                   | ■ Digital Loss Plan      |                       |

---

 **NOTE:**

Brief call-waiting tones are optimal because, while a tone is sounding, speech cannot be heard.

## Basic Forms

# 5

---

This section contains DEFINITY ECS Basic forms.

## Abbreviated Dialing List — Enhanced List

---

This form implements an Enhanced Abbreviated Dialing List. The Enhanced List can consist of ten separate forms numbered from 0 through 9 that allow up to 1000 numbers to be assigned or the Enhanced List can consist of 100 separate forms numbered 0 through 99 that allow up to 10,000 members to be assigned. These two options are discussed below. Regardless of the option you select, the Enhanced List can be accessed by users to place local, long-distance, and international calls; to activate/deactivate features; or to access remote computer equipment.

**⇒ NOTE:**

The Abbreviated Dialing Enhanced List field must be enabled on the System-Parameters Customer-Options form before an Enhanced List can be administered.

Form 0 assigns dial code list entries 000 to 099, form 1—100 to 199, form 2—200 to 299, form 3—300 to 399, form 4—400 to 499, form 5—500 to 599, form 6—600 to 699, form 7—700 to 799, form 8—800 to 899, and form 9—900 to 999 (the form number indicates the first digit of the dial code).

Only one Enhanced Abbreviated Dialing List can be assigned in the system. The list is controlled by the System Administrator.

For attendants with abbreviated dialing, the Console-Parameters form must also be administered.

### Administration commands

---

Use the following commands to administer the Abbreviated Dialing — Enhanced List form.

| Action  | Object                       | Qualifier <sup>1</sup> |
|---------|------------------------------|------------------------|
| add     | abbreviated-dialing enhanced | Enter form number      |
| change  | abbreviated-dialing enhanced | Enter form number      |
| display | abbreviated-dialing enhanced | Enter form number      |
| remove  | abbreviated-dialing enhanced | Enter form number      |

1. If Enhanced Abbreviated Dial Length on the Feature-Related System-Parameters form is set to **3**, enter form number 0 through 9; if the field is set to **4**, enter form number 00 through 99.

## Form instructions

---

Make assignments as required for the following fields on each page of the form. The example screen form shows only form 0.

### Page 1 of the form

Page 1 of 4

ABBREVIATED DIALING LIST  
Enhanced List  
Size (multiple of 5): 5 Privileged? n

DIAL CODE

100: \_\_\_\_\_  
101: \_\_\_\_\_  
102: \_\_\_\_\_  
103: \_\_\_\_\_  
104: \_\_\_\_\_  
105: \_\_\_\_\_

### Screen 5-1. Abbreviated Dialing Enhanced List — form 1 (page 1 of 4)

- **Size (multiple of 5)** — Enter the number of dial code list entries that will be entered on the form. Up to 100 entries per form are allowed. The size must be entered in multiples of 5 up to 100. Default is **5**.
- **Privileged** — Enter **y** or **n** (default). If **y** is entered, the originating party's class of restriction (COR) is never checked and any number in the list will be dialed. If **n** is entered, the COR is checked to determine if the number can be dialed.

## Implementation notes

---

The default value for the `Size` field is **5**. Therefore, only DIAL CODEs 100 through 104 will display initially.

### Pages 1 through 4 of the form

- **DIAL CODE** — Enter the numbers you want to assign to each dial code.

**NOTE:**

A Vector Directory Number extension may also be assigned.

Up to 24 characters can be used for each entry.

Valid entries for each dial code are:

- Digits 0–9
- \* (star) used for a feature activation or deactivation code
- # (pound) used for a feature activation or deactivation code
- Special characters (count as two characters each):
  - ~p (1.5 second pause between digits)
  - ~w (wait for dial tone)
  - ~m (change to output pulse DTMF digits at the end-to-end rate)
  - ~s (start suppressing display of the digits being outputted)
  - ~W (indefinite wait)

**NOTE:**

If W is used, the switch waits indefinitely for dial tone. This should be used only where network response time is more than 30 seconds.

**NOTE:**

While the system is waiting, a call progress tone receiver is tied up, and, since there are a limited number of receivers in the system, outgoing calling capability may be impaired.

See [“Abbreviated Dialing” on page 4-1](#) for a detailed description of the special characters.

## Abbreviated Dialing List — Group List

This form implements the Abbreviated Dialing Group List. The Group Lists are controlled by the System Administrator. Up to 100 numbers can be entered per group list that can be accessed by users to place local, long-distance, and international calls; to activate/deactivate features; or to access remote computer equipment.

### Administration commands

Use the following commands to administer the Abbreviated Dialing Group List form.

| Action  | Object                    | Qualifier <sup>1</sup>  |
|---------|---------------------------|---|
| add     | abbreviated-dialing group | 1-MAX (or 'next')   |
| change  | abbreviated-dialing group | 1-MAX   |
| display | abbreviated-dialing group | 1-MAX ['print' or 'schedule']                                     |
| list    | abbreviated-dialing group | [xx]['number' x]['to-number' x]['count' n]['print' or 'schedule'] |
| remove  | abbreviated-dialing group | 1-MAX   |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the maximum number available in your system configuration.

### Form instructions

Make assignments, as required, for the following fields on each page of the form.

## Page 1 of the form

Page 1 of X

ABBREVIATED DIALING LIST

Group List: \_\_\_\_\_

Size (multiple of 5): 5 Program Ext: \_\_\_\_\_ Privileged? n

DIAL CODE

01: \_\_\_\_\_

02: \_\_\_\_\_

03: \_\_\_\_\_

04: \_\_\_\_\_

05: \_\_\_\_\_

Screen 5-2. Abbreviated Dialing Group List form (page 1 of X)

- **Group List** — Enter a group number when completing a paper form. This is a display-only field when the form is accessed using an administration command such as **add** or **change**.
- **Size (multiple of 5)** — Enter the number of abbreviated dialing codes you want to assign. The number must be entered in multiples of five. Default is 5.
- **Program Ext** — Enter the extension that has permission to program the Group List.
- **Privileged** — Enter **y** or **n** (default). If **y** is entered, the calling voice terminal's class of restriction (COR) is never checked and any number in the group list will be dialed. If **n** is entered, the calling voice terminal's COR is checked to determine if the number can be dialed.

## Implementation notes

The default value for the *Size* field is **5**. Therefore, only DIAL CODEs 01 through 05 will be displayed initially. This form becomes two pages for *Size* field entries of 31 through 60, three pages for entries of 61 through 90, and four pages for entries 91 through 00.

Depending on entry setup on System Parameters — Customer Options, A/D Grp/Sys list dialing start at (01) list items may start at 00 or 01 Abbreviated Dialing List forms: <\$startrange> Group List form.

## Pages 1 through 3 of the form

- **DIAL CODE** — Enter the numbers you want to assign to each dial code.

**NOTE:**

A Vector Directory Number extension may also be assigned.

Up to 24 characters can be used for each entry.

Valid entries for each dial code are:

- Digits 0–9
- \* (star) used for a feature activation or deactivation code
- # (pound) used for a feature activation or deactivation code. # can be the first digit of any FAC.
- Special characters (count as two characters each):
  - ~p (1.5 second pause between digits)
  - ~w (wait for dial tone)
  - ~m (change to outpulse DTMF digits at the end-to-end rate)
  - ~s (start suppressing display of the digits being outpulsed)
  - ~W (indefinite wait)

**NOTE:**

If ~W is used, the switch waits indefinitely for dial tone. This should be used only where network response time is more than 30 seconds.

**NOTE:**

While the system is waiting, a call progress tone receiver is tied up, and, since there are a limited number receivers in the system, outgoing calling capability may be impaired.

## Abbreviated Dialing List — Personal List

---

This form establishes a personal dialing list for voice terminal/data module users. The personal list must first be assigned to the voice terminal by the System Administrator before the voice terminal user can add entries in the list. The lists can be accessed by users to place local, long-distance, and international calls; to activate/deactivate features; or to access remote computer equipment.

### Administration commands

---

Use the following commands to administer the Abbreviated Dialing — Personal List form.

| Action  | Object                       | Qualifier <sup>1</sup>  |
|---------|------------------------------|---|
| change  | abbreviated-dialing personal | xxxx (extension number of assigned personal list) and List 1-3                            |
| display | abbreviated-dialing personal | xxxx (extension number of assigned personal list) and List 1-3<br>['print' or 'schedule'] |
| list    | abbreviated-dialing personal | [xxxx (extension)]['ext' x]['to-ext' x]['count' n] ['print' or 'schedule']                |

1. Brackets [] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the maximum number available in your system configuration.

## Form instructions

Screen 5-3. Abbreviated Dialing Personal List form (page 1 of 1)

Make assignments, as required, for the following fields on the form.

- **Personal List** — Enter the extension number of the voice terminal that will use this list.
- **List Number** — Enter a number from 1 to 3. This number identifies each of the three personal lists that can be assigned to the voice terminal.
- **Size (multiple of 5)** — Enter the number of abbreviated dialing numbers to be assigned. This number must be entered in multiples of 5, up to 100. Default is 5.
- **DIAL CODE** — Enter the numbers you want to assign to each dial code.

**NOTE:**

A Vector Directory Number extension may also be assigned.

Up to 24 characters can be used for each entry.

Valid entries for each dial code are:

- Digits 0–9
- \* (star) used for a feature activation or deactivation code
- # (pound) used for a feature activation or deactivation code
- Special characters (count as two characters each):
  - ~p (1.5 second pause between digits)
  - ~w (wait for dial tone)
  - ~m (change to outpulse DTMF digits at the end-to-end rate)

5 Basic Forms

*Abbreviated Dialing List — Personal List*

Page 5-10

~s (start suppressing display of the digits being outpulsed)

~W (indefinite wait)

 **NOTE:**

If ~W is used, the switch waits indefinitely for dial tone. This should be used only where network response time is more than 30 seconds.

 **NOTE:**

While the system is waiting, a call progress tone receiver is tied up, and, since there are a limited number of receivers in the system, outgoing calling capability may be impaired.

### Implementation note

---

The default value for `Size` is **5**. Therefore, only DIAL CODEs 1 through 5 will be displayed initially. DIAL CODEs 6 through 0 will also be displayed if the `Size` field is "10". DEFINITY ECS allows up to 100 DIAL CODEs.

Depending on entry setup on System Parameters — Customer Options, A/D Grp/Sys list dialing start at (01) list items may start at 00 or 01.

## Abbreviated Dialing List — System List

---

This form implements a system abbreviated dialing list. Only one system list can be assigned and is administered by the System Administrator. The list can be accessed by users to place local, long-distance, and international calls; to activate/deactivate features; or to access remote computer equipment.

### Administration commands

---

Use the following commands to administer the Abbreviated Dialing System List form.

| Action  | Object                     | Qualifier <sup>1</sup>  |
|---------|----------------------------|-------------------------|
| add     | abbreviated-dialing system | —                       |
| change  | abbreviated-dialing system | —                       |
| display | abbreviated-dialing system | ['print' or 'schedule'] |
| remove  | abbreviated-dialing system | —                       |

- 
1. Brackets [] indicate the qualifier is optional.

### Form instructions

---

Make assignments, as required, for the following fields on each page of the form.

## Page 1 of 4 of the form

Page 1 of X

ABBREVIATED DIALING LIST  
System List

| DIAL CODE | Size (multiple of 5): 5 | Privileged? n |
|-----------|-------------------------|---------------|
| 01:       | _____                   |               |
| 02:       | _____                   |               |
| 03:       | _____                   |               |
| 04:       | _____                   |               |
| 05:       | _____                   |               |
| 06:       | _____                   |               |

| 10:       | _____                   |               |
| 11:       | _____                   |               |
| 12:       | _____                   |               |
| 13:       | _____                   |               |
| 14:       | _____                   |               |
| 15:       | _____                   |               |

### Screen 5-4. Abbreviated Dialing System List form (page 1 of X)

- **Size (multiple of 5)** — Enter the number of abbreviated dialing numbers to be assigned. This number must be entered in multiples of 5, up to 100. Default is 5.
- **Privileged** — Enter **y** if the originating party's class of restriction (COR) is never checked and any number in the list can be dialed. Enter **n** (default) if the COR is to be checked to determine if the number can be dialed.

### Pages 1 through 3 of the form

- **DIAL CODE** — Enter the numbers you want to assign to each dial code.

#### NOTE:

A Vector Directory Number extension may also be assigned.

Up to 36 characters can be used for each entry.

Valid entries for each dial code are:

- Digits 0–9
- \* (star) used for a feature activation or deactivation code
- # (pound) used for a feature activation or deactivation code
- Special characters (count as two characters each):
  - ~p (1.5 second pause between digits)
  - ~w (wait for dial tone)

5 Basic Forms

*Abbreviated Dialing List — System List*

Page 5-13

~m (change to outpulse DTMF digits at the end-to-end rate)

~s (start suppressing display of the digits being outpulsed)

~W (indefinite wait)

 **NOTE:**

If ~W is used, the switch waits indefinitely for dial tone. This should be used only where network response time is more than 30 seconds.

 **NOTE:**

While the system is waiting, a call progress tone receiver is tied up, and, since there are a limited number of receivers in the system, outgoing calling capability may be impaired.

Depending on entry setup on System Parameters — Customer Options, A/D Grp/Sys list dialing start at (01) list items may start at 00 or 01.

## Implementation notes

---

The default value for the *Size* field is **5**. Therefore, only DIAL CODEs 01 through 05 will be displayed initially. This form becomes two pages for *Size* field entries of 31 through 60, three pages for entries of 61 through 90, and four pages for entries 91 through 00.

## Abbreviated Dialing List — 7103A Button List

---

This form assigns abbreviated dialing numbers to the 7103A voice terminal buttons. The entries can then be accessed by 7103A voice terminal users to place local, long-distance, and international calls; activate/deactivate features; or to access remote computer equipment. This form applies only to 7103A fixed feature voice terminals. Only one 7103A abbreviated dialing list can be implemented in the system and it applies to all 7103A fixed feature voice terminals in the system. This list is controlled by the System Administrator.

### Administration commands

---

Use the following commands to administer the Abbreviated Dialing — 7103A List form.

| Action  | Object                            | Qualifier               |
|---------|-----------------------------------|-------------------------|
| add     | abbreviated-dialing 7103A-buttons | —                       |
| change  | abbreviated-dialing 7103A-buttons | —                       |
| display | abbreviated-dialing 7103A-buttons | ['print' or 'schedule'] |
| remove  | abbreviated-dialing 7103A-buttons | —                       |

### Form instructions

---

Make assignments, as required, for the following fields on each page of the form.

(In the following, the dial code numbers 1 through 8 as shown on the form relate to the buttons on the 7103A voice terminal.)

## Pages 1 through 4 of the form

Page 1 of 1

ABBREVIATED DIALING LIST  
7103A Button List

DIAL CODE (FOR THE 7103A STATION BUTTONS)

|          |          |
|----------|----------|
| 1: _____ | 5. _____ |
| 2: _____ | 6. _____ |
| 3: _____ | 7. _____ |
| 4: _____ | 8. _____ |

### Screen 5-5. Abbreviated Dialing List — 7103A Button List

- **DIAL CODE FOR THE 7103a STATION BUTTONS** — Enter the number you want to assign to each dial code (button). Any additions or changes apply to all 7103A fixed feature voice terminals.

**NOTE:**

A Vector Directory Number extension may also be assigned.

Up to 24 characters can be used for each entry.

Valid entries for each dial code are:

- Digits 0–9
- \* (star) used for a feature activation or deactivation code
- # (pound) used for a feature activation or deactivation code
- Special characters (count as two characters each):
  - ~p (pause)
  - ~w (wait)
  - ~m (mark)
  - ~s (suppress)
  - ~W (indefinite wait)

**NOTE:**

If ~W is used, the switch waits indefinitely for dial tone. This should be used only where network response time is more than 30 seconds.

While the system is waiting, a call progress tone receiver is tied up, and, since there are only two receivers per tone decoder, outgoing calling capability may be impaired.

## **Implementation**

---

The default value for the `Size` field is **5**. Therefore, only DIAL CODEs 01 through 05 will be displayed initially. This form becomes two pages for `Size` field entries of 31 through 60, three pages for entries of 61 through 90, and four pages for entries 91 through 00.

Depending on entry setup on System Parameters — Customer Options, A/D Grp/Sys list dialing start at (01) list items may start at 00 or 01.

## Administered Connection

---

This form assigns an end-to-end Administered Connection (AC) between two access endpoints or data endpoints. The AC is established automatically by the system whenever the system restarts or the AC is due to be active. See [“Administered Connections” on page 4-13](#) and [“Access Endpoint” on page 7-72](#) in this book for additional information.

### Administration commands

---

Use the following commands to administer the Administered Connection form.

| Action    | Object                  | Qualifier <sup>1</sup>                        |
|-----------|-------------------------|---|
| add       | administered-connection | 1-MAX (or 'next')                             |
| change    | administered-connection | 1-MAX (or 'next')                             |
| display   | administered-connection | 1-MAX (or 'next') ['print' or 'schedule']     |
| duplicate | administered-connection | 1-MAX (or 'next')                             |
| remove    | administered-connection | 1-MAX (or 'next')                             |
| list      | administered-connection | 1-MAX ['count' 1-MAX] ['print' or 'schedule'] |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the maximum number available in your system configuration.

## Form instructions

---

```

                                                                 Page 1 of 1

    Priority: 5
```

### Screen 5-6. Administered Connection form (page 1 of 1)

Make assignments as required for the following fields on the form:

- **Connection Number** — This is a display-only field when the form is accessed using an administration command such as **change** or **display**. Enter an unassigned AC number.
- **Enable** — Enter **y** (default) to indicate an attempt will be made to establish the AC when the AC is due to be active.
- **Originator** — Enter the assigned extension of the originating access endpoint or data endpoint. The endpoint must be local to the switch on which the AC is administered. Endpoints may be:
  - Nonsignaling DS1 trunk or analog tie trunk
  - TN726 data line circuit pack
    - Asynchronous EIA 232C compatible equipment
  - TN754 digital line circuit pack connections, including:
    - MPDM (700D), MTDM (700B, 700C, 700E), 7400D data module
    - 7400A, 7400B, 7400C HSL, 8400B data module
    - 7401D Voice Terminal with 7400B or 8400B data module
    - 7403D/7405D/7407D/7410D/7434D voice terminal with DTDM or 7400B or 8400B data module
    - 7404D or 7406D voice terminal
    - 510D personal terminal

- 515 BCT, 615 BCT, or 715 BCT terminal
- PC/PBX connection
- TN556 ISDN-BRI line circuit pack connections, including:
  - 7500 data module
  - 7505D/7506D/7507D voice terminal with ADM

Default is blank.

- **Destination** — Used to route the AC to a desired endpoint. Enter the address of the destination access or data endpoint. This endpoint is the terminating party of the AC and need not be local to the switch on which the AC is assigned. Valid entries are the digits 0 through 9, \*, #, and special characters ~**m** (mark), ~**s** (suppress), ~**p** (pause), ~**w** (wait), ~**W** (indefinite wait). The entry must be consistent with the local switch's dial plan (that is, the first digits are assigned as an extension, feature access code, or trunk access code, or DDD Number). If a local extension is entered, it must be assigned to either an access or data endpoint. Up to 36 characters may be entered. Special characters count as two characters. Abbreviated Dialing entries may be used in this field. Default is blank.

 **NOTE:**

If ~W is used, the switch waits indefinitely for dial tone. This should be used only where network response time is more than 30 seconds.

While the system waits, a call progress tone receiver is tied up, and, since there are only two receivers per tone decoder, outgoing calling capability may be impaired.

- **Name** — Enter a short identification of the AC. This entry is optional. Up to 27 printable alphanumeric characters may be entered. Default is blank.
- **Continuous** — Enter **y** (default) to indicate that the AC is continuous (that is, not scheduled to be active at a certain time). If **y** is entered, the seven *Start Days* and associated *Duration* fields are not displayed.
- **Start Days (Sun through Sat)** — Only displays if the *Continuous* field is **n**. Enter **y** in each of the required days of the week fields to indicate that an attempt will be made to establish the AC. Default is **n**.

 **NOTE:**

These fields indicate only the days on which an attempt will be made to establish the AC and not necessarily the days on which the AC is active. A scheduled AC may be active over a number of days, and, in this situation, these fields should be used only to specify the days on which the AC starts and not other days on which the AC may be active.

- **Start Time** — Only displays if the **Continuous** field is **n**. Enter the time of the day when an attempt should begin to establish a scheduled AC. The time is specified in two fields separated by a colon. Valid entries are in the range **00:00** through **23:59**. Default is **00:00**.
- **Duration** — Only displays if the **Continuous** field is **n**. Enter the period of time that the scheduled AC should remain active. This period is specified in two fields separated by a colon. The maximum duration is 167 hours and 59 minutes (that is, 1 minute less than 1 week). Valid entries are **000** through **167** for the hour field and **00** through **59** for the minute field. Default is **000:00**.
- **Alarm Type** — Enter the type of alarm to be generated if the AC cannot be initially established, or fails and cannot be reestablished, and the number of consecutive failures equals the alarm threshold. The alarm notification may be disabled for this AC by entering **none** in this field. Valid entries are **major**, **minor**, **warning** (default), or **none**.

 **NOTE:**

All AC alarms and the errors that caused the alarms are recorded in the system's alarm and error log. In addition, a status lamp associated with an attendant console or voice terminal feature button (ac-alarm) may be used to indicate the AC alarm.

- **Alarm Threshold** — Only displays if an entry of other than **none** is entered in the **Alarm Type** field. Enter the number of times an attempt to establish or reestablish an AC must fail consecutively before an AC alarm generates. An alarm generates on the first failure if **1** is entered in this field. Valid entries are **1** through **10**. Default is **5** (an alarm will be generated after the fourth retry has failed, thus, with the default retry interval of 2 minutes, an alarm will be generated approximately 8 minutes after the first failure occurs).
- **Retry Interval** — Enter the number of minutes between attempts to establish or reestablish the AC. Valid entries are **1** through **60**. Default is **2**.
- **Auto Restoration** — Enter **y** to indicate that an attempt is to be made to reestablish an AC that failed. Auto Restoration is available only for an AC that is established over an ISDN Software Defined Data Network (SDDN) trunk group. A **y** (default) entered in this field is ignored in all other situations.
- **Priority** — Enter a number in the range from **1** through **8** that is to be used to determine the order in which ACs are to be established (1 is the highest and 8 the lowest priority). Default is **5**.

## Alias Station

---

This form administers new voice terminal types not supported by system software. This form allows the mapping of new terminal types to the supported terminal types. This mapping does not guarantee compatibility, but allows nonsupported terminals to be administered and tracked by their own names.

System administration must refer to customer voice terminal documentation for supported types and associated manuals for non-supported types to avoid type mismatches between the new terminal and the supported terminal.

### NOTE:

Data Communication Protocol (DCP) terminal types must be mapped (aliased) to DCP terminal types, hybrid types to hybrid types, and analog to analog types.

See [“Enhanced Voice Terminal Display” on page 4-322](#) in this book for additional information.

## Administration commands

---

Use the following commands to administer the Alias Station form.

| Action  | Object        | Qualifier <sup>1</sup>  |
|---------|---------------|-------------------------|
| change  | alias station | —                       |
| display | alias station | ['print' or 'schedule'] |

---

1. Brackets [ ] indicate the qualifier is optional.

## Form instructions

---

Page 1 of 1

| ALIAS STATION  |                    |
|----------------|--------------------|
| Alias Set Type | Supported Set Type |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |
| _____          | _____              |

'#' indicates previously aliased set type is now native

### Screen 5-7. Alias Station form (page 1 of 1)

Make assignments as required for the following fields on the form:

- **Alias Set Type** — Enter the nonsupported voice terminal type to be aliased to a similar supported voice terminal type. Up to six characters (all printable characters except blank characters) are allowed.

**NOTE:**

A duplicate nonsupported type entry is not allowed on the form (that is, SET20 and Set20 are considered as duplicates).

- **Supported Set Type** — Enter the supported voice terminal type to be mapped or aliased to the nonsupported type entered immediately to the left in *Alias Set Type*. Up to five characters (all printable characters except blank characters) are allowed. Supported voice terminal types are summarized in [“Voice terminals — general” on page 6-4](#).

## Implementation notes

---

When a system containing an alias set type is upgraded to a new release that supports the previously aliased set type as a native set type, the last character of the aliased set type appends a “#.” This indicates that it is no longer necessary to alias the set type to another supported type. If the set type takes up all six characters, the “#” replaces the last character.

It is recommended (though not required) that stations using the alias set type be changed to use the newly supported set type, and the alias set type be removed from the Alias Station form.

## Alphanumeric Dialing Table

---

This form associates alpha-names to dialed digit strings. This allows terminal users to place a *data call* by simply typing the alpha-name. Users need only remember far-end alpha-names instead of the actual digit strings.

The form consists of paired Alpha-name/Mapped String fields. Entries may be made in any order on the form. However, before the form is displayed for changing or reviewing, the entries in the table are sorted alphanumerically by the alpha-name. All entries will be moved to the beginning of the table, leaving all blank entries at the end.

### Administration commands

---

Use the following commands to administer the Alphanumeric Dialing Table form.

| Action  | Object                  | Qualifier <sup>1</sup> |
|---------|-------------------------|------------------------|
| change  | alphanumeric-dial-table | —                      |
| display | alphanumeric-dial-table | [print]                |

---

1. Brackets [ ] indicate the qualifier is optional.

### Form instructions

| _____      | _____         | _____      | _____         |
| _____      | _____         | _____      | _____         |

Screen 5-8. Alphanumeric Dialing form (page 1 of 2)

Make assignments as required for the following fields on the form:

- **Alpha-name** — Enter from one to eight alphanumeric characters. The entry must start with an alphabetic character and may not have blank spaces between characters. All alpha-names in the table must be unique and cannot be referenced in their own "Mapped String". The alpha-names can be used in any other "Mapped String" and multiple times in a "Mapped String". Default is blank.
- **Mapped String** — Enter from 1 to 24 characters that may contain alphanumeric, readability, delimiters, and/or special characters. The entry is used to generate the final dialing string and can include Facility Access Codes. The following characters are allowed:

**Numeric** — Digits **0** through **9**.

**Alpha** — **A** through **Z**, **a** through **z** (note uppercase entries are mapped to lowercase).

**Readability** — Character delimiters used for easy reading of the dial string. The characters are "(", ")", "/", "-", and the space character.

 **NOTE:**

A Mapped String may not contain an Alpha-Name whose Mapped String also contains an Alpha-Name.

- **Special Characters** — Used to identify a special operation. The characters are:

"#" and "\*" — Each treated as a numeric.

"^" — Treated as a readability character.

"~w" — Suspend digit outputting until a dial tone is detected.

"~p" — Pause 1.5 seconds. (Used only for outgoing trunk calls. If used internally, the 1.5 second pause is ignored.)

"~m" — Digits following this character are for end-to-end signaling. Following digits to be outputted as tones regardless of type of trunk signaling, pulse, or tone.

Delimiters can consist of both readability and special characters and are used to separate tokens of "alpha-names" or numeric sub-strings. For example, "(205) mt-1234+0000".

## Announcements/Audio Sources

---

This form assigns analog, DS1, auxiliary trunk, or integrated announcements, audio/music sources, or any desired combination of announcements and audio sources. Integrated announcements are assigned and recorded on all TN750A, B, and C announcement circuit packs.

The analog announcements are assigned to analog line circuit packs, such as TN746 or TN2183, that are connected to external recording or playback equipment. External announcement equipment can also be connected via an auxiliary trunk (TN763). DS1 announcements are assigned to DS1 ports on circuit packs, such as TN767 or TN464.

Each announcement is accessed by dialing an extension number that is assigned to each announcement.

Integrated announcements on the TN750B and TN750C circuit packs can be recorded at 16 kbps (for 8 minutes and 32 seconds of total announcement time), 32 kbps (for 4 minutes and 16 seconds of total announcement time), or 64 kbps (for 2 minutes and 8 seconds of total announcement time) depending on administration. A different recording speed may be used for each integrated announcement. These capacities are different if a combination of different recording speeds is used.

A R5r and later configurations support a maximum of 10 integrated announcement circuit packs (TN750Cs). At 16 kbps this provides 5120 seconds (1 hour and 24 minutes) of announcement time. At 32 kbps this provides 2560 seconds (42 minutes) of announcement time.

### CAUTION:

*Do not copy, save, or restore announcements from a TN750C to a TN750 or TN750B, as it may corrupt the announcement data.*

## Copy Announcements

---

Copy announcements is used to copy MSS announcement files from disk to tape or tape to disk.

The TN750C circuit pack contains FLASH memory which provides internal backup of announcements on the circuit packs. Thus, the TN750C circuit pack does not need the Save and Restore processes still available for the TN750 and TN750B circuit packs. However, you can use the save and restore processes to copy announcements between TN750B/C circuit packs. See [Appendix B, "Administration Commands"](#) for information on the save announcement and restore announcement commands.

## Save Announcements

Save Announcements is used to save announcements from the announcement circuit pack to MSS.

## Restore Announcements

Restore Announcements is used to restore announcements from MSS to the announcement circuit pack.

## Erase Announcements

You can erase the existing announcements stored on a TN750C circuit pack's FLASH and DRAM memory by executing the erase announcements command. You must supply the circuit pack location of the circuit pack as part of the command argument. When you execute a valid erase announcements command, you will see a warning message:

### **WARNING:**

*This erase announcement command will erase the specified circuit packs flash and DRAM memory.*

If you respond by pressing the enter key, the announcement circuit pack is erased. If you respond by pressing the cancel key, the announcement circuit pack is not erased. The erase command outputs the status (busy, success, etc.) of the flash memory after executing the erase command.

## Remove Announcement

Use the change announcements command to remove an existing announcement. You need only blank out the extension and type fields of the existing entry. The integrated announcement will be removed from the integrated announcement circuit pack; it will not be removed from the backup tape or disk. Use the delete announcement FAC before you change announcements. Otherwise, the recording time used by the announcement will not be made available.

## Administration commands

Use the following administration commands to administer the recorded announcements form. In some cases, just the most commonly used commands are shown. See [Appendix B, "Administration Commands"](#), for a complete listing of all administration commands, the command structure, and the use of abbreviated command words when entering a command.

5 Basic Forms

Announcements/Audio Sources

| Action  | Object                 | Qualifier <sup>1</sup>   |
|---------|------------------------|--|
| change  | announcements          | —  |
| change  | integ-annc-brd-loc     |  |
| display | announcements          | ['print' or 'schedule']  |
| display | integrated-annc-boards | ['print' or 'schedule']  |
| erase   | announcements          | board-location   |
| list    | integrated-annc-boards | board-location<br>['print' or 'schedule']<br>This qualifier is optional. |
| copy    | announcements          | 2  |
| restore | announcements          | <u>2</u>   |
| save    | announcements          | <u>2</u>   |

- 
1. Brackets [ ] indicate the qualifier is optional.
  2. See [Appendix B, "Administration Commands"](#) in this manual for more information.
- 

## Form instructions

Make assignments as required for the following fields on the form:

5 Basic Forms

Announcements/Audio Sources

Pages 1 through 8 of the form

| ANNOUNCEMENTS/AUDIO SOURCES |            |     |    |                |   |      |     |      |        |
|-----------------------------|------------|-----|----|----------------|---|------|-----|------|--------|
| Ext.                        | Type       | COR | TN | Name           | Q | QLen | Pro | Rate | Port   |
| 1: 1701_                    | analog     | 1_  | 1_ | busy           | y | 1000 | N/A | N/A  | 1B0404 |

Screen 5-9. Recorded Announcements form (page 1 of X)

- **Ext** — Enter a 1- to 5-digit unassigned extension number that agrees with the dial plan. References to a particular announcement "Ext" may be from the following forms: Hunt Group, Coverage Path, Trunk Group (Incoming Destination and Night Destination), Vector, and Feature-Related System Parameters (DID/Tie/ISDN Intercept Treatment, Controlled Restriction fields).
- **Type** — Enter the type of announcement you want to assign to this extension number. Valid entries are **analog-m**, **analog**, **analog-fd**, **aux-trunk** (auxiliary trunk, for using external announcement device with a 4-wire "aux" interface), **aux-trk-m**, **ds1-fd**, **ds1-ops**, **ds1-sa**, **integ-rep** (integrated repeating), and **integrated**.

If **integrated** or **integ-rep** is entered, complete the **Protect**, **Rate**, and **Port** fields. If **analog**, **ds1-fd**, **ds1-sa**, **ds1-ops**, or **aux-trunk** is entered, complete the **QLen** (if **Q** is **y**) and **Port** fields.

Integrated announcements have a pre-set queue length (used over all installed circuit packs) based on the DEFINITY ECS configuration, but the **Q** field must be **y** if you want to enable queueing.

- **COR** — Enter the desired class of restriction (COR) number from **0** through **95**. Default is **1**.
- **TN** — Enter the Tenant Partition number. Default is **1**.
- **Name** — Enter up to 27 alphanumeric characters to describe the announcement message.

- **Q (Queue)** — Enter **y** in this queue field to queue calls for the announcement. If the type is either **integ-rep** or **aux-trunk**, enter **y** to queue calls or **b** to enable barge-in. Default is **n** (no queue and no barge-in). You can enter **b** only if **Type** is **aux-trunk** or **integrated**. This field should always be **y** for ACD and Vectoring delay announcements. The **QLen** (Queue Length) field only applies if **y** is entered in this field with analog, DS1, and aux types.
- **QLen (Queue Length)** — Applicable if the **Q** (Queue) field is **y** and the **Type** field is **analog** or **aux-trunk**. Enter the number of calls that can be queued for this analog announcement. The sum of the queue entries for all analog announcements cannot exceed the maximum number allowed for your system configuration. Default is **0**. When the **Type** field entry is **integrated** or **integ-rep**, “N/A” displays in this field.
- **Pro** — Enter **y** to protect the integrated announcement from being deleted or changed by any user. Enter “**n**” (default) to allow only users with a console permission COS to change or delete an announcement. When the **Type** field is **analog**, **ds1**, or **aux-trunk**, then “N/A” displays in this field.
- **Rate** — Used to specify the recording speed (in 1000 bits/second) when recording announcements on the TN750B or TN750C Integrated circuit pack. Valid entries are **16**, **32** (default), or **64**. When the **Type** field is **analog**, **ds1**, or **aux-trunk**, then “N/A” displays in this field.
- **Port** — You can enter an integrated announcement circuit pack location in this field or an aux trunk, analog line, or DS1 port location (a station/single line voice terminal form is not to be administered). When a port location is changed for an integrated announcement, the recording on the previous circuit pack location is erased. To change the port locations for all announcement extensions assigned to a circuit pack location to another circuit pack location without erasing the announcements on the original circuit pack, change the Integrated Announcement Translations form.

An integrated announcement circuit pack location breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 44 |
|            |                | 01 through 03 |
|            |                | 01 (G3s)      |
| 3          | Carrier        | A through E   |
| 4-5        | Slot Number    | 01 through 20 |

An aux or analog location breaks down as follows:

| Characters | Meaning        | Value  |
|------------|----------------|--|
| 1-2        | Cabinet Number | 01 through 44                                      |
|            |                | 01 through 03                                      |
|            |                | 01 (G3s)   |
| 3          | Carrier        | A through E  |
| 4-5        | Slot Number    | 01 through 20                                      |
| 6-7        | Circuit Number | 01 through 16 (analog)<br>01 through 04 aux-trunk) |

## Implementation notes

Announcements 1 and 3 show the fields that are assigned to the analog and integrated announcement, respectively.

The `QLen` field only displays when the `Type` field is **analog**, **ds1**, or **aux-trunk** and the `Queue` field is **y**.

The `Prot` field only displays when the `Type` field is **integrated**.

Only one TN750 or TN750B circuit pack is allowed per system. You can use TN750C circuit packs exclusively or use one TN750B with multiple TN750C circuit packs.

INTEGRATED ANNOUNCEMENT BOARDS

Last Board Location Saved 02C09 on 07/24/94 0:30 am

| Board<br>Loc. | Sfx | Time Remaining<br>at 32Kbps | Number of<br>Recordings | Checksum ID |

| 6:            |     |                             |                         |             |
| 7:            |     |                             |                         |             |
| 8:            |     |                             |                         |             |
| 9:            |     |                             |                         |             |
| 10:           |     |                             |                         |             |

Screen 5-10. Example Display Integrated Announcement Boards

- The number of lines displayed corresponds to the number of announcement circuit packs plugged in with the maximum dictated by the system maximum.
- Time Remaining displays the time, in seconds, that can be recorded in the remaining memory at 32 Kbps. Length in Seconds displays the amount of time that the recording would take at 32 Kbp. It does not convert the length to reflect the actual length if the recording was at 16 or 64 Kbps. The sum of the Length in Seconds and Time Remaining fields is always 256 seconds.
- Number of Recordings is the count of non-zero length recordings on the circuit pack.
- Checksum ID is a four character hexadecimal value (the first two characters are always 00) returned from the TN750C circuit pack. The checksum is calculated from the announcements stored on the circuit pack. The circuit pack internally updates this value every time an announcement is recorded or deleted. The checksum is 0000 when nothing is recorded on the circuit pack. Circuit packs other than the TN750C do not provide the Checksum ID and will display a blank in the Checksum ID column.
- The date, time, and location of the announcement circuit pack most recently saved on MSS displays after the "Last Board Location Saved" heading. This date is part of the translation data so you must run "save translations" to retain the date. These fields are set to N/A if a circuit pack has not been saved using the save announcement command or the save translations were not run before rebooting. The information here may not be the same time as displayed on "list config software". (If the time is not

the same, the announcements for a TN750 or TN750B should be saved again.) "List config software" presents the date of the announcement saved on MSS.

- The **List Config** command reports the date on which the save announcement was last executed successfully. It is the date for MSS announcements; not translation data.
- The Display Integrated command reports the date on which the save announcement was last executed successfully. It is translation data and will be lost if you do not run save translations.

```

INTEGRATED ANNOUNCEMENTS

Board Location: 01B04                               Time Remaining at 32Kbps: 25

Internal      Announcement
Number        Extension    Name          Rate          Length in
              Ext #       (Name)        (Kbps)        Seconds
-----
1             Ext #       (Name)        16            3
2             16003      sales ad      32            18
3             15003      sales 1st delay 32            210
4             15005      sales 2nd delay 64            0
    
```

Screen 5-11. Example List Integrated Announcements (page 1 of X)

- The **List Integrated Announcements** command provides information on all integrated announcement circuit packs (default) or only a selected circuit pack. Use this command to verify announcement extension assignments.
- If a circuit pack does not have announcements on it and does not have announcements administered on it, then no information about the circuit pack will be presented with the list command.
- Announcements that are recorded on the circuit pack, but which are not assigned to an extension, are displayed without an extension and name. You can see this in the first line of the example.
- An R5r and later configuration can list a maximum of 256 announcements. An R5si and later can list a maximum of 128.
- `Internal Number` is the internal announcement number referring to a specific announcement on the circuit pack that you requested. It does not correspond to the reference number that is displayed on the Announcement form.

5 Basic Forms

Announcements/Audio Sources

Page 5-34

- `Announcement Extension` is the extension that was mapped to the internal number when the extension was administered on the Announcement form.
- `Name` is the name administered on the Announcement form.
- `Rate` is administered on the Announcement form.
- `Length in Seconds` is the length of the announcement at 32 kbps at the circuit pack location pointed to by the internal number.
- `Time Remaining` displays the time, in seconds, that can be recorded in the remaining memory at 32 kbps. Double this time for recording at 16 kbps or halve the time for recording a 64 kbps.

CHANGE INTEGRATED ANNOUNCEMENT TRANSLATIONS

Change all board location translations from board: \_\_\_\_\_ to: \_\_\_\_\_

Changing board locations using this command will change all currently administered "from" board locations on the "ANNOUNCEMENTS/AUDIO SOURCES" screen to the "to" board location.

Screen 5-12. Change Integrated Announcement Translations form

## Attendant Console

This form assigns an Attendant Console to the system.

### Administration commands

Use the following commands to administer the Attendant Console form.

| Action  | Object    | Qualifier <sup>1</sup>        |
|---------|-----------|-------------------------------|
| add     | attendant | 1-MAX                         |
| change  | attendant | 1-MAX                         |
| display | attendant | 1-MAX ['print' or 'schedule'] |
| remove  | attendant | 1-MAX                         |

1. Brackets [ ] indicate the qualifier is optional. MAX is the maximum number available in your system configuration.

### Form instructions

```

```

Screen 5-13. Attendant Console form (page 1 of X)

Make assignments as required for the following fields on each page of the form:

**Page 1 of the form**

- **Attendant Console x** — Enter the console number when completing a paper form. This is a display-only field when the form is accessed using an administration command such as **add** or **change**.
- **Type** — Indicates the type of attendant console being administered. Valid options are **console** (default) and **302B1**.
- **Extension (Optional)** — Enter the extension for the individual attendant console. If an extension is not assigned, the attendant can only be addressed as a member of the attendant group. If the attendant has a data module, the extension field cannot be blank. Default is blank. Once administered, the individual attendant extension can also be entered in any of the following:
  - Any coverage point in a call coverage path (Coverage Path form)
  - CAS Backup Extension (Console Parameters form)
  - Hunt Group Supervisor Extension (Hunt Group form)
  - LDN Night Extension (Listed Directory Numbers form)
  - Stations with system-wide Message Retrieval Permission (Feature-Related System Parameters form)
  - Member of a Hunt Group (Hunt Group form)
  - Incoming Destination for a Trunk Group (Trunk Group forms)
  - Night Service Destination for a Hunt Group (Hunt Group form)
- **Console Type** — Enter this console's intended use. Valid entries are **principal**, **day-only**, **night-only**, or **day/night**. Default is blank. There can only be one night-only or one day/night console in the system unless Tenant Partitioning is administered. Night Service is activated from the principal console or from the one station set per-system that has a nite-serv button.
- **Port** — Enter seven characters.

The entry breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 44 |
|            |                | 01 through 03 |
|            |                | 01            |

| Characters | Meaning        | Value   |
|------------|----------------|---|
| 3          | Carrier        | A through E   |
| 4-5        | Slot Number    | 01 through 20   |
| 6-7        | Circuit Number | 01 through 08 (digital line circuit pack)<br>01 through 16 (2-wire digital circuit pack)<br>01 through 24 (2-wire digital circuit pack<br>TN2224) |

 **NOTE:**

When using the Administration Without Hardware feature, place an **X** in this field to indicate that there is no hardware associated with this port assignment. An individual attendant extension must be assigned in the `Extension` field.

Each attendant console requires a port on a digital line circuit pack. For reliability, the attendant consoles should not be assigned to ports on the same digital line circuit pack. For example, if three attendant consoles are to be provided, assign each console to a port on three different digital line circuit pack, if possible. However, if required, all attendant consoles can be assigned to ports on the same digital line circuit pack.

- **Name** — Enter the name of this console (up to 27 alphanumeric characters). Any entry is accepted, default is blank.
- **Group** — Enter the Attendant Group number. Default is **1**.
- **TN** — Enter the Tenant Partition number. Default is **1**.
- **COS** — Enter the class of service (COS) for this attendant console (**0** through **15**). Default is **1**.
- **COR** — Enter the class of restriction (**0** through **95**) that reflects the desired restriction. Default is **1**.
- **Auto Answer** — Entering **all** in this field indicates an incoming call to an idle attendant will be answered automatically without any action (no button presses required) by the attendant. Entering **acd** for indicates only ACD split/skill calls and direct agent calls can auto answer. Non-ACD calls terminated to an attendant console with Auto Answer set to **acd** ring audibly. Entering **none** causes all calls terminated to this attendant console to receive some sort of audible ringing treatment. Default is **none**.
- **Data Module** — Enter **y** if the console is to be connected to a data terminal via 7400B or 8400 Data Module. If **y** is entered, complete the Data Module form (page 4). Default is **n**.
- **Disp Client Redir** — This field is administrable only if the `Hospitality` feature has been enabled on the System-Parameters Customer-Options form. This field affects the station's display on calls originated from a station with Client Room Class of Service. When the field is **n** (default), then for all calls originating from a Client Room (even redirected calls) that terminate to this station, this station's display will not show the redirection

information. Only the client name and extension (or room, depending on what is administered on the Hospitality form) displays. When the field is **y**, the redirection information for a call originating from a Client Room and terminating to this station displays.

 **NOTE:**

For stations with an “audix” station type, AUDIX Voice Power ports, or ports for any other type of messaging that needs display information, this field must be **y**.

- **Display Language** — Enter the language in which you want console messages displayed. Valid entries are **English, French, Italian, Spanish,** and **user-defined**. Default is **English**.
- **DIRECT TRUNK GROUP SELECT BUTTON ASSIGNMENTS (Trunk Access Codes)** — Enter the trunk access codes (TACs) for local and remote PBXs. (There are fields for one local TAC and one remote TAC per button labeled *Local* and *Remote*.) The local TAC (1 to 4 digits) refers to a trunk group or Loudspeaker Paging zone on this PBX. Remote TACs are only useful in a private network (including DCS) network. The remote TAC (1 to 3 digits) refers to a trunk group on the remote PBX. If a remote TAC is given, then the local TAC must refer to a trunk group that connects directly to the remote PBX and is also limited to 1 to 3 digits.

Lucent recommends a DCS trunk be specified as the local TAC between the local and remote switches. If the TAC specified as local between the local and remote switches is not a DCS trunk, the remote trunk cannot be monitored by the local switch.

- **HUNDREDS SELECT BUTTON ASSIGNMENTS** — Enter in the appropriate field (1 through 20), the hundreds group to be associated with a Hundreds Group Select button located on an optional selector console. Fields 1 through 8 are used when the selector console is a 24A-type console (See [Figure 5-3](#)) and fields 1 through 20 are used when the console is a 26A-type console (See [Figure 5-3](#)). The hundreds group number entered in the field represents all but the last two digits of an extension number (for example, the Hundreds Select Button — on the selector console — for extension 3822 would be “38”; the Hundreds Select Button for extension 27105 would be “271”). The last two digits of an extension number are obtained (after pressing a Hundreds Group Select button) by pressing the appropriate extension button (00 through 99) on the console.

ASSIGNED MEMBER ( Station with a data extension button for this data module )
  Ext      Name
  1:
  
```

Screen 5-14. Attendant Console Data Module form (page 2 of 4)

This page displays if the Data Module field on Page 1 is **y**. Complete the Data Module form as follows:

- **Data Extension** — Enter the extension number assigned to the data module. A data extension can be a 1- to 5-digit number and must agree with the system's Dial Plan.
  - **BCC** — Display-only field. Only displays when the ISDN-PRI or ISDN-BRI Trunks field is enabled on the System-Parameters Customer-Options form.
-  **NOTE:**  
 The BCC value is used to determine compatibility when non-ISDN facilities are connected to ISDN facilities (ISDN Interworking feature).
- **ITC** — Enter **restricted** or **unrestricted**.
  - **Name** — Enter the name of the user associated with the data module. The name is optional, it can be left blank.
  - **COR** — Enter the desired class of restriction (COR) number from **0** through **95**. Default is **1**.
  - **TN** — Enter the Tenant Partitioning number. Default is **1**.
  - **COS** — Enter the desired (COS) number from **0** through **15** to designate allowed features. See ["Class of Service" on page 4-277](#) for additional information on the allowed features. Default is **1**.
  - **ABBREVIATED DIALING List1:** — Enter **s** (system), **g** (group), **p** (personal), or **e** (enhanced). If **g** or **p** is entered, a group number or personal list number also is required.
  - **SPECIAL DIALING OPTION** — Enter one of three dialing options that are available. This identifies the destination of all calls when this data module originates calls. Valid entries are **hot-line**, **default**, or leave blank.

- **HOT LINE DESTINATION — Abbreviated Dialing Dial Code** — Only displays when the `Special Dialing Option` field is **hot-line**. Enter a dial code within the range of the abbreviated dialing list type. The associated AD number is dialed when the user goes off-hook on a Data Hot Line call.
- **DEFAULT DIALING Abbreviated Dialing Dial Code** — Only displays when the `Special Dialing Option` field is **default**. Enter a dial code within the range of the abbreviated dialing list type. The associated AD number is dialed when the user goes off-hook and enters a carriage return following the “DIAL” prompt. The data call originator also can perform data terminal dialing by specifying a dial string that may or may not contain alphanumeric names.
- **Ext** — Display-only field. This is the extension number of a previously administered user who has an associated Data Extension button and who will share the use of the module.
- **Name** — Display-only field. Contains the name assigned to the above extension number.

Screen 5-15. Attendant Console form (page Y of X)

- **FEATURE BUTTON ASSIGNMENTS** — Enter the feature buttons from [“Attendant Console Feature Button Characteristics”](#) table that you want to assign to the attendant console. The fixed buttons that cannot be changed (that is, split and forced release) are shown on the form. The hold, night-serv, and pos-busy buttons are shown in the system default locations. These buttons can be administered elsewhere on the form. The following provides descriptions of feature buttons that are unique to the

attendant console. See the Button Assignment Tables in this section and to the ["Voice-terminal feature button descriptions" on page 6-14](#) for a description of the feature buttons.

- Audible Tones On/Off
  - **cw-ringoff** — Call waiting ringer off; turns on/off the audible tone for call waiting on attendant console (1 per console).
  - **in-ringoff** — Incoming call ringer off; turns on/off the audible tone for incoming call ringer (1 per console).
  - **re-ringoff** — Timed reminder ringer off; turns on/off the audible tone for timer reminder ringer (1 per console).
- Alternate FRL (**alt-frl**) — Alternate facility restriction level; allows the attendant to activate or deactivate the AFRL feature. When activated, this allows the originating device (lines or trunks) to use an alternate set of the facility restriction levels to originate a call (1 per console).
- Attendant Control of Trunk Group Access
  - **act-tr-grp** — Activate trunk group access; allows the attendant to control a trunk group. All calls going to the trunks are routed to the attendant (1 per console).
  - **deact-tr-g** — Deactivate trunk group access; allows the attendant to release control of a trunk group (1 per console).
- Display Class of Restriction (**class-rstr**) — Used to display the COR associated with a call (1 per console).
- Emergency Access to the Attendant (**em-acc-att**) — The associated status lamp is flashed when there is one or more calls on the emergency attendant queue (1 per console).
- Hold (**hold**) — When the Hold button is pressed while the attendant is active on a loop, the party on the loop is put on hold and the "call type" button associated with the loop is lit (1 per console).
- Position Busy (**pos-busy**) — When this button is pushed, the attendant is put into position busy mode, the "Pos Avail" light is turned off, and the light associated with the pos-busy button is lit. Pushing the pos-busy button a second time takes the console out of "position busy" mode, turns on the "Pos Avail" light and turns off the light associated with the pos-busy button.

If the pos-busy button is administered on a 2-LED button, the top LED flashes when the last attendant goes into "Position Busy" mode. Otherwise, if the button has only one LED, the single LED associated with the pos-busy button flashes (1 per console).
- Serial Call (**serial-cal**) — This button allows the attendant-extended calls to return to the same attendant if the trunk remains off-hook (1 per console).

- Attendant Override (**override**) — This button enables the attendant to override diversion features such as, Call Forwarding, Call Coverage, and so on (1 per console).
- Call Offer (**intrusion**) — Depression of this button allows the attendant to extend a call when the called party is active on another call (1 per console).
- Don't Split (**dont-split**) — This button allows the attendant to not split away a call when dialing (1 per console).
- Visually Impaired Attendant Service (**vis**) — This button activates visually impaired service for the attendant. When this service is activated, the attendant can listen to console status or messages by pressing buttons that have been translated as follows:
  - "con-stat" repeats the console status.
  - "display" calls out display contents.
  - "dtgs-stat" calls out the DTGS status.
  - "last-mess" repeats the last message.
  - "last-op" calls out the last operation.
- Trunk Group Select — In addition to the 12 Direct Trunk Group Selection (DTGS) Button Assignments on Page 1 of the form, up to 12 single lamp DTGS buttons can be administered on this page. The status lamp associated with the feature button is used to monitor the busy/idle status of the trunk. Trunk groups administered on these buttons cannot be controlled using Attendant Control of Trunk Group Select buttons. The single lamp DTGS buttons can be administered as follows:
  - **local-tgs** — Local trunk group select; allows the attendant to access trunk groups on the local PBX (combination of 12 local-tgs/remote-tgs per console).
  - **remote-tgs** — Remote trunk group select; allows the attendant to access trunk groups on a remote PBX (combination of 12 local-tgs/remote-tgs per console).
  - **hundred-sel** — Hundreds group select; in addition to the fixed HGS buttons on Page 1 of the form, a user can administer hundreds group select feature buttons on this page. When a feature button is administered as "hundred-sel," a subfield appears that must then be administered in the same manner as the fixed HGS button fields (a 1 to 3 digit hundreds group plus prefix, if needed). Administered "hundred-sel" feature buttons operate in the same manner as fixed HGS buttons.

The total number of hundreds group select buttons (fixed and administered) allowed on a console is 20. Thus, if all 20 fixed HGS buttons have been administered, no "hundrd-sel" feature buttons can be administered.

 NOTE:

If no fixed HGS buttons are administered, 19 "hundrd-sel" feature buttons are available. This is because 5 of the 24 feature buttons must be used for required feature buttons (hold, pos-busy, night-serv, forced-rel, and split).

- Group Display (**group-disp**) — Allows the attendant to see a display of extensions currently being tracked on the DXS module.
- Group Select (**group-sel**) — Allows the attendant to select a specific group of hundreds by dialing the first 2 or 3 digits of the hundreds group.
- Attendant Room Status
  - **occ-rooms** — Occupied rooms; allows the attendant to see which rooms are occupied.
  - **maid-stat** — Maid status; allows the attendant to see which rooms are in one of six specified states.
- VuStats (**vu-display**) — This button allows users with display terminals and attendants to turn on the VuStats display. The limit to the number of VuStats feature buttons you can administer depends on how many feature buttons are available on the attendant console you are administering. The system is designed to allow you to set up a separate VuStats display format for each feature button. Therefore, agents can change the type of measurements on their display by selecting a different VuStats feature button.
  - If 12 HGS buttons are assigned on page 2 of the form, it is recommended that the "night," "pos-busy," and "hold" buttons be reassigned to locations 20, 21, and 3, respectively. The HGS buttons should then be assigned to the right-most three columns, as required.

## Implementation note

---

- \* These buttons are shown here in their system default locations. However, you can administer these buttons in other locations on the form.

Screen 5-16. Attendant Console form (page Y of X)

- **DISPLAY MODULE BUTTON ASSIGNMENTS** — Enter the desired feature or functions from [Table 5-1](#). Display-type buttons obtain display functions on the associated alphanumeric display. These buttons are noted as [display button] in the Feature or Function column on the table. Also, several feature buttons can be administered so that their associated status lamps can be used to provide visual indications of the associated feature or function. In some cases, the button itself is not operational. These buttons are noted as [status lamp]. If a Call Cover Msg Rt (cov-msg-rt) button is assigned, a Leave Word Calling Delete Msg (delete-msg) button and a Next (next) button must also be assigned.

**Implementation note**

---

Default feature buttons shown above. Other display feature buttons as noted on Basic Console Feature Button Assignment table can be administered here, as required.

N = any number of buttons on the voice terminal can be assigned to this feature. Feature button descriptions are provided in [“Voice-terminal feature button descriptions” on page 6-14.](#)

- List: List number 1 to 3 where the destination number is stored.  
DC: Dial codes of destination number.
- Grp: The split group number for ACD.
- Code: Enter a stroke code (0 through 9).
- TAC: local-tgs — TAC of local TG  
remote-tgs — (L-TAC) TAC of TG to remote PBX  
remote-tgs — (R-TAC) TAC of TG on remote PBX  
The combination of local-tgs/remote-tgs per console must not exceed 12 (maximum).  
Label associated button appropriately so as to easily identify the trunk group.
- Grp: Enter a hundreds group number (1 through 20).
- Enhanced Hospitality must be optioned on the System-Parameters Customer-Options form.

**5 Basic Forms**  
*Attendant Console*

*Page 5-53*

7. May be assigned either to a voice terminal or an attendant console.
  8. Ext: May be a VDN extension.
  9. This button can be administered as either an attendant display button or a feature button.
  10. Link: A link number — 1 to 8 for multi-carrier cabinets, 1 to 4 for single-carrier cabinets.
  11. Grp: A trunk group number.
  12. Grp: Group number of the hunt group.
  13. VDN of Origin must be enabled.
  14. When this button is pressed, "Call Type 1" (answered public network call), "Call Type 2" (unanswered public network call), or "Call Type 3" (all other calls) displays for 1 second.
-

## Authorization Code — COR Mapping

This form assigns authorization codes and associates them with classes of restriction (CORs). On an internal originating call, the COR assigned the facility (such as station) being used to originate the call and its Partition Group Number (PGN) (when assigned) is used to select a routing pattern. With this, the calling party can dial a 4- to 7-digit authorization code to override the FRL assigned the COR (may be associated with voice/data terminals, incoming trunk groups, remote access trunk groups, or attendant consoles). This allows users within each PGN to have access to all seven FRLs (when assigned) and still remain partitioned. On an incoming remote access call, dialing an authorization code as part of the call dialing sequence selects the COR and the associated PGN to be used in processing the call.

### NOTE:

The use of authorization codes when accessing a Vector Directory Number extension will be denied.

To maximize the security of the system, the following should be considered:

1. Authorization Codes should be administered to the maximum length allowed by the system.
2. Authorization Codes should be nonconsecutive (random) and changed at least quarterly.
3. Authorization Codes should be deactivated immediately if a user leaves the company or changes assignments.
4. Assign each Authorization Code the minimum level of calling permissions required.

### Administration commands

Use the following commands to administer the Authorization Codes form.

| Action  | Object             | Qualifier               |
|---------|--------------------|-------------------------|
| change  | authorization-code | auth (4-7 digit number) |
| display | authorization-code | auth (4-7 digit number) |
| list    | authorization-code | none                    |

Screen 5-17. Authorization Code — COR Mapping form (page 1 of 1)

- Make assignments as required for the following fields on the form:
- **Number of Codes Administered** — This is a display-only field and contains the sum of the number of Authorization Codes that has been administered using the Authorization Codes form.
  - **AC** — Enter the 4- to 7-digit authorization code the user must dial. The number of digits entered must agree with the number assigned to the Authorization Code Length field on the Feature-Related System Parameters form.
-  **NOTE:**  
To enhance system security, choose Authorization Codes of seven random digits.
- **COR** — Enter the desired COR number from **0** through **95**.

## Bulletin Board

---

The Bulletin Board form allows you to change and display the information in the bulletin board.

### Administration commands

---

Use the following commands to administer the Bulletin Board..

| Action  | Object         | Qualifier <sup>1</sup> |
|---------|----------------|------------------------|
| change  | bulletin-board |                        |
| display | bulletin-board | [print or schedule]    |

---

1. Brackets [ ] indicate the qualifier is optional.

### Form instructions

---

#### General Information

##### Creating Bulletin Board Messages

The message line for all pages and all lines of the form will allow you to enter 40 characters. If you enter a blank line, it will display. If you enter two or more succeeding blank lines, the system will consolidate them and only store one. The system will also remove a blank line if it is in line 1 of any of the pages. Blank line consolidation for the first ten lines of Page 1 is independent of blank line consolidation performed for lines 11 through 19 of Page 1.

Tabs are not allowed. If you use a tab, it will move the cursor to the next field.

Any of the following characters are valid for all pages and all lines of the form:

- A through Z
- a through z
- Blank
- 0 through 9
- !@#\$%^&\*()\_+=[{}|\~";:','<.>/?

##### Deleting Bulletin Board Messages

You delete a line from the bulletin board by entering a space as the first character of an existing line. You can, however, add a message line with blank as the first character.

## Storing Bulletin Board Messages

You store the information that you have entered just as you do any other SAT command. That is, you hit the PF3 or <enter> key, depending on your terminal type.

### Page 1 of the Bulletin form

Page 1 of 3

| Message (* indicates high-priority)       | Date     |
|---|----------|
| *Lucent is in the process of              | 03/02/93 |
| *investigating your trunk lockup problem. | 03/02/93 |
| *The Bulletin Board will be updated as    | 03/02/93 |
| *we find information.                     | 03/02/93 |
| * We have identified the problem.         | 03/04/93 |
| *The trunk you added does not provide     | 03/04/93 |
| *disconnect supervision. However, the     | 03/04/93 |
| *trunk group was administered as such.    | 03/04/93 |
| *Please call Pat J. for details.          | 03/04/93 |
| <br>                                      |          |
| We recently added a new trunk group (14)  | 03/02/93 |
| and have had many of the members getting  | 03/02/93 |
| locked up.                                | 03/02/93 |
| We see the error - thanks for checking.   | 03/05/93 |

### Screen 5-18. Sample Bulletin Board form (page 1 of 3)

**Lines 1 through 10** — Lines 1 through 10 of the bulletin board are reserved for high priority messages. These lines are noted with an asterisk (\*) in the first column on the left. If you have an init or inads login you can enter high-priority information to trigger the high-priority message at login time.

**Lines 11 through 19** — Enter any additional information.

**Date** — This is a display-only field. The system enters the date that the line of information was entered or last changed.

### Page 2 and 3 of the Bulletin form

**Lines 1 through 20** — Enter any additional information.

**Date** — This is a display-only field. The system enters the date that the line of information was entered or last changed.

## Cabinet

---

### ⇒ NOTE:

This form is applicable only to R5r and later configurations.

This form describes cabinets and to define mapping between external and internal circuit pack addresses so that circuit packs and ports can be identified in a uniform way.

### Administration commands

---

Use the following commands to administer the Cabinet Administration form.

| Action  | Object  | Qualifier <sup>1</sup>     |
|---------|---------|----------------------------|
| add     | cabinet | xx                         |
| remove  | cabinet | xx                         |
| change  | cabinet | xx                         |
| display | cabinet | xx ['print' or 'schedule'] |
| list    | cabinet | ['print' or 'schedule']    |

- 
1. "xx" is the cabinet number (01-44 for R5r and later). Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

**Form instructions**

| E       | _____        | ___ ___ | ___       |

**Screen 5-19. Cabinet Administration form**

Make assignments as required for the following fields on the form:

- **Cabinet** — Display-only field. This field shows the cabinet number as entered in the command line.
- **Cabinet Layout** — Enter the type of physical carrier layout. Valid entries are **five-carrier** and **single-carrier-stack**. Default is blank.
- **Cabinet Type** — Display-only field. This field shows the type of cabinet being administered. If cabinet "01" is being administered, this field is "processor." If cabinets "02 through 44" are being administered, this field is "expansion-portnetwork."
- **Number of Port Networks** — Enter the number of PNs in the cabinet. Valid entries are **1** (default), and **2**.
- **Survivable Remote EPN** — Displays only if *Cabinet Type* is "expansion-portnetwork." If set to **y**, the cabinet has a remote si processor that provides a backup if the links to this cabinet are inoperative.
- **Survivable Remote Processor ID** — Displays only if *Survivable Remote EPN* is **y**. Enter the product ID assigned to the remote si. This allows DEFINITY Fault Management to know which machine is the backup for this cabinet. The entry in this field cannot be the same as the entry in the *Production Identification* field in the Maintenance-Related System Parameters form.
- **Room** — Enter up to ten characters identifying the room where the cabinet is located. Default is blank.

- **Floor** — Enter up to ten characters identifying the floor in the building where the cabinet is located. Default is blank.
- **Building** — Enter up to ten characters identifying the building where the cabinet is located. Default is blank.
- **Carrier Type** — Enter the type of carrier in the cabinet being administered. Valid entries are **dup-switch-node**, **expansion-control**, **not-used**, **port**, **processor**, and **switch-node**.
- **Number** — Display-only field. Consists of two fields: the `Designator` and `Number` fields. The `Designator` field contains one of the following entries:
  - **PN** — If the carrier is a port carrier, processor carrier, or unused carrier.
  - **SN** — If the carrier is a switch node carrier, or duplicate switch node carrier.

The `Number` field contains either the switch node number or port network number.

- **Duplicate** — The location for the duplicate of a switch node. Only displays when administration of PNC Duplication is enabled. If the `Carrier Type` is **dup-switch-node**, the field displays the three-character carrier address of the duplicate. The first two characters represent the cabinet number; the third character represents the carrier (A through E).

This is a display-only field if the `Carrier Type` is **switch-node**.

## Implementation notes

This form only displays for R5r and later configurations.

This form is for a 5-carrier cabinet layout. The `Carrier Description` fields vary for a single-carrier stack and for different configurations of switch nodes and port networks.

When adding or removing cabinets you can leave gaps in their numbering. For example, if you are adding a cabinet and want to leave some cabinet numbers available in the middle of the cabinet range for future expansion, then port network numbers are assigned by the system which will always use the lowest available PN.

## CAMA Numbering Format form

This form administers the Centralized Automatic Message Accounting (CAMA) trunks and provides Caller's Emergency Service Identification (CESID) information to the local community's Enhanced 911 system through the local Tandem Office.

This form provides the CESID format by extension number or number blocks. This allows for multiple CESID formats to be sent over multiple CAMA trunk groups allowing for mixed station numbering plans and some limited conversion from non-DID to DID numbers typically required by the Private Switch/Automatic Location Interface (PS/ALI) database.

The default CESID defines the CESID for all extension which are not defined in the `Ext Code` field.

There are 86 CESID entries over three pages. The first page contains the Default CESID and 26 extensions to CESID entries. The second and third pages each contain 30 extensions to CESID entries.

### Administration commands

The ability to change and display CAMA numbering is restricted to Administrators with add/change permission.

Use the following commands to administer the CAMA Numbering Format form.

| Action  | Object         | Qualifier <sup>1</sup>  |
|---------|----------------|-------------------------|
| change  | cama-numbering | —                       |
| display | cama-numbering | ['print' or 'schedule'] |

1. Brackets [] indicate the qualifier is optional. Single quotes (') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

**Form instructions**

Make assignments as required for the following fields on the form.

**Page 1 of the form**

| —          | —           | —        | —               | —          | —           | —     | —               |

**Screen 5-20. CAMA Numbering Format form**

**Field descriptions**

- **System CESID Default** — The default CESID is the CESID sent over the cama trunk if the Ext Code field is not defined on the cama numbering form. Enter 1 to 16 digit number or leave blank (default).
- **Ext Len** — The number of digits in the extension. Valid entries are from 1 to 5 or leave blank (default).
- **Ext Code** — Contains the leading digits or all the digits in the extension for the specified CESID. If the extension length is greater than the number of digits in the extension code, the extension code will be interpreted as a block of digits. For example, if the extension length is 4 and the extension code is 11, the CESID will serve extensions 1100 through 1199. The Ext Code [11] is for a DID block. Ext Code [126] may point a non-DID block to a nearby DID extension 5241666. Valid entries can be up to 5 digits, or leave blank (default).
- **CESID** — The number used to identify the calling terminal within an emergency service system. This field may represent a prefix to an extension or the entire CESID. Enter 1 to 16 digits, or leave blank (default).
- **Total Length** — The total number of digits to send. Valid entries are from 1 to 16 or leave blank (default).

## CDR System Parameters

The Call Detail Recording (CDR) System Parameters form allows the generating of records that contain information about particular calls controlled by the switch. This information is useful for call costing, diagnostics, abuse detection, and network optimization.

### Administration commands

Use the following commands to administer the CDR System Parameters form.

| Action  | Object                | Qualifier |
|---------|-----------------------|-----------|
| change  | system-parameters cdr | —         |
| display | system-parameters cdr | —         |

### Form instructions

#### Page 1 of the form

Record Non-Call-Assoc TSC?  Call Record Handling Option:

Record Call-Assoc TSC?  Digits to Record for Outgoing Calls:

Privacy - Digits to Hide:  CDR Account Code Length:

#### Screen 5-21. CDR System Parameters form (page 1 of X)

Make assignments as required for the following fields on each page of the form:

- **Node Number (Local PBX ID)** — The DCS switch node number in a network of switches. This field is display only.

- **CDR Date Format** — Enter **month/day** or **day/month** (default) to select the format for recording CDR date information for timestamp date records of all formats. If using a customized format, make Date a six-digit field to ensure the proper output.
- **Primary Output Format** — Controls data presentation sent to the primary output device. Entering **customized** generates the second page of this form for the customized record administration. Other options are **59-char**, **expanded**, **lsu**, **lsu-expand**, **int-direct**, **int-isdn**, **int-process**, **printer**, **teleseer**, **unformatted**, or blank (default).
- **Primary Output Extension** — Appears when the `Primary Output Format` field contains a valid value. Enter the extension number assigned to the primary output device, or **eia** for R5vs/si and later configurations. This field is required if a Primary Output Format is specified. Default is blank.

 **NOTE:**

The first digit of the CDR extension number and the length of that number must agree with the first digit table of the dial plan.

- **Secondary Output Format** — Controls data presentation sent to the secondary output device. Valid entries are **lsu**, **unformatted**, **int-direct**, **int-process** or blank (default).

 **CAUTION:**

*This option should only be used by qualified (Lucent Technologies) service personnel. This option may cause loss of data when the buffer contains large amounts of data.*

- **Secondary Output Extension** — Appears when the secondary output format is administered. Enter the extension number assigned to the secondary output device, or **eia** for R5vs/si and later configurations. Default is blank.

 **NOTE:**

The first digit of the CDR extension number and the length of that number must agree with the first digit table of the dial plan.

- **Use ISDN Layouts** — Enter **y** to use ISDN record layouts. This field applies to both the primary and secondary formats if applicable. The "lsu" and "printer" output formats will be affected, as well as any format with ISDN layouts, such as "teleseer." Default is **n**. This field and `Use Enhanced Formats` cannot both be **y**.
- **EIA Device Bit Rate** — Applies to R5vs/si and later configurations only. Displays if either `Primary` or `Secondary Output Format` is **eia**. Enter the bit rate of the CDR device connected to the EIA port. Valid entries are **300**, **1200**, **2400**, and **9600**.

- **Use Enhanced Formats** — Enter **y** to enable the use of the Enhanced version of the specified primary output format. This field applies to both the primary and secondary output formats if applicable; however, only the "expanded", "teleseer", "lsu", "printer", and "unformatted" output formats will be affected. This field and `Use ISDN Layouts` cannot both be **y**.
- **Modified Circuit ID Display** — Enter **y** to modify the format of the incoming and outgoing circuit ID from the 10's, units, 100's format (the default) to 100's, 10's, units. Only the "printer," "teleseer," and "59-character" output formats will be affected.
- **Remove # From Called Number** — If the value of this field is **n** (default) a trailing "#" (or "E") symbol appears in the `Dialed Number` field whenever inter-digit time out or end of dialing occurs. Enter **y** to have the "#" (or "E") symbol removed from the `Dialed Number` field of the call detail record.
- **Record Outgoing Calls Only** — Enter **y** to report outgoing calls; enter **n** (default) to report both outgoing and incoming calls.
- **Intra-Switch CDR** — Enter **y** to record calls within the switch. Default is **n**.
- **Suppress CDR for Ineffective Call Attempts** — Enter **y** (default) to ignore reporting of ineffective call attempts. Ineffective call attempts are calls originated by a voice terminal user that are blocked because the user did not have sufficient calling privileges or because all outgoing trunks were busy. This includes the unavailable incoming or outgoing trunks due to trunk usage allocation for ISDN Call-by-Call Service Selection trunks and incoming calls rejected by the switch due to NSF mismatch. Enter **n** to report ineffective call attempts.
- **Outg Trk Call Splitting** — Enter **y** to enable splitting of call records for outgoing calls that are transferred or conferenced.
- **Disconnect Information in Place of FRL** — Enter **y** to record disconnect information or "n" (default) to record the call's FRL.

**NOTE:**

This field changes the `Facility Restriction Level (FRL)` field of the CDR record to record the reason for disconnect of a call rather than the FRL. It is used for isolating problems between the `Generic 3r` and the telephone network.

- **Outg Attd Call Record** — Only appears if `Outg Trk Call Splitting` is "y." Enter "y" to enable separate recording of attendant portions of outgoing calls that are transferred or conferenced.
- **Interworking Feat-flag** — Enter **n** (default) if you want feat-flag operation to treat interworking as no answer supervision. Enter **y** if you want feat-flag operation to show interworked calls with a separate feat-flag value than timed answer and network answer calls.

- **Force Entry of Acct Code for Calls Marked on Toll Analysis Form** — Specifies whether an account code will be required when making a toll call. This will not necessarily be all chargeable calls and it may even include some non-chargeable calls. Entering **y** denies all toll calls without an account code. Default is **n**.
- **Calls to Hunt Group — Record** — Enter **member-ext** (default) to record the extension of the voice/data terminal where the call terminated; enter **group-ext** to record the extension that was dialed. The extension of the voice/data terminal in the hunt group that answered the call is the extension assigned to the hunt group.
- **Record Called Vector Directory Number Instead of Group or Member** — Enter **y** to include the Vector Directory Number (VDN) in the `Dialed Number Field` of a CDR record. This field and the `Record Called Agent Login ID Instead of Group or Member` field cannot both be **y**. Default is **n**.

**NOTE:**

A VDN overrides group or member information that is otherwise stored in the `Dialed Number Field` of the CDR record. If a call is directed through more than one VDN, the first VDN used for the call is stored.

- **Record Called Agent Login ID Instead of Group or Member** — Only displays if `Expert Agent Selection (EAS)` is enabled on the `System-Parameters Customer-Options` form. Enter **y** to indicate whether the EAS agents `LoginID` is recorded instead of the physical extension in the `Dialed Number`. This field and the `Record Called Vector Directory Number Instead of Group or Member` field cannot both be **y**.
- **Inc Trk Call Splitting** — Enter **y** to enable splitting of call records for incoming calls that are transferred or conferenced.
- **Inc Attd Call Record** — Only appears if `Inc Trk Call Splitting` is **y**. Enter **y** to enable separate recording of attendant portions of outgoing calls that are transferred or conferenced.
- **Record Non-Call-Assoc TSC** — Enter **y** to record non-call-associated TSC information. Default is **n**.
- **Call Record Handling Option** — Displays on R5r and later configurations only. Used to control call routing when new calls come in, the CDR link is down, and the buffer is filled. Enter **reorder** to block with an intercept, **warning** (default) to stop recording when the buffer is full, or **attendant** to route the call to an attendant with options to proceed as a non-CDR call.

**NOTE:**

Changing this field from the default **warning** may cause ACD & vector calls that are measured by CDR to be redirected.

- **Record Call-Assoc TSC** — Enter **y** to record call-associated TSC information. Default is **n**.
- **Digits to Record for Outgoing Calls** — Enter **dialed** or **outpulsed** to record the dialed or outpulsed digits in the Dialed Number field of the CDR.
- **Privacy — Digits to Hide** — Enter the number of digits (**0 to 7**) to be blanked from the back (right to left) of the Dialed Number field on the CDR record; default is **0**.

For example, if "4" is entered in this field and the user dials 555-1234, only "555" would appear in the Dialed Number field of the CDR record. CDR Privacy must be enabled on the Station form.

- **CDR Account Code Length** — Enter the number of digits collected when the CDR account code is entered. Default is **2**.

|                    |   |     | Record length = 11    |   |     |                    |   |     |

Screen 5-22. CDR System Parameters form (page 2 of 2)

This page appears only if Primary Record Format is customized.

**Data Item** — Enter the data items in the order they should appear on the customized record. The default for all fields is blank, but you must enter at least one field in order to have a record. A **line-feed** and **return** must be the last two data items in a customized record (see Page 2 sample). See [Table 5-2](#) below for valid entries:

Table 5-2. Valid Data Item Entries

| Data Item      | Length | Data Item  | Length |
|----------------|--------|------------|--------|
| acct-code      | 15     | ins        | 3      |
| attd-console   | 2      | isdn-cc    | 11     |
| auth-code      | 7      | ixc-code   | 4      |
| bandwidth      | 2      | line-feed  | 1      |
| bcc            | 1      | ma-uui     | 1      |
| calling-num    | 10     | node-num   | 2      |
| clg-num-in-tac | 10     | null       | 1      |
| code-dial      | 4      | out-crt-id | 3      |
| code-used      | 4      | ppm        | 5      |
| cond-code      | 1      | res-flag   | 1      |
| date           | 6      | return     | 1      |
| dialed-num     | 18     | sec-dur    | 5      |
| duration       | 4      | space      | 1      |
| feat-flag      | 1      | time       | 4      |
| fri            | 1      | tsc_ct     | 4      |
| in-crt-id      | 3      | tsc_flag   | 1      |
| in-trk-code    | 4      | vdn        | 5      |

- **Length** — Enter the length of each data item, if different from the default.
- **Record Length** — A display-only field that shows the length of the customized record. This field is updated each time the data item length field is changed.

## Circuit Packs

---

This form administers circuit packs to carrier slots before the circuit packs are actually installed in the carrier or cabinet. This allows the system to be configured (administered) when the circuit packs have not yet been physically inserted in their appropriate slots. Before any voice terminals, attendant consoles, or trunks can be administered in the system, the correct type of circuit pack must be installed in the appropriate slot, or using the Circuit Pack form, a circuit pack must be assigned to the slot.

The Circuit Pack Administration forms do not have to be completed if the system cabinet is equipped with the circuit packs at the time of administration. However, for switch node carriers, these forms must be administered.

See *DEFINITY Communications System Generic 3 Planning and Configuration*, 555-230-601, for additional information on circuit pack administration and Port Assignment Records. (The DS1 circuit pack and associated translation coverage is provided in later in this book).

### **WARNING:**

*For initial installation procedures, circuit packs should only be assigned slots per the hardware Configuration Layout record (obtained from the factory or Customer Services Support Organization). Arbitrarily assigning circuit packs to slots should not be attempted because this eventually requires (at the time of installation and test) realignment of the circuit packs and reworking associated wiring to agree with the software translations or new software translations to agree with the shipped hardware configuration.*

## Administration commands

---

Use the following commands to administer the Circuit Pack form.

| Action  | Object        | Qualifier <sup>1</sup>                      |
|---------|---------------|---|
| change  | circuit-packs | xx (cabinet number)                         |
| display | circuit-packs | xx (cabinet number) ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. "xx" is the cabinet number.

### **NOTE:**

If no cabinet number is specified, this command defaults to 1.

 **NOTE:**

For R5r and later configurations, if the Carrier Type (as administered through the Cabinet Administration form) does not match the physical hardware, the Code fields may display question marks.

- **Slot** — Display-only field. The slot equates to the physical slot of the given carrier; the number of slots displayed depends on the system being configured.
  - For R5r and later configurations, the number of slots represent all administrable slots available for the given carrier type.
  - For R5si and later configurations, all slots that could possibly be administered are displayed, even if they do not apply to the current configuration of the system. This is to accommodate the situation when a system is being reconfigured.
- **Code** — Enter the circuit pack code ("TN" followed by a 3- or 4-digit number). If there is a physical circuit pack installed in the slot, the entry must match that of the circuit pack. If there is equipment administered on a slot, the equipment must be removed from the circuit pack before the circuit pack can be changed or removed.
- **Sfx** — Enter the circuit pack suffix, if applicable.
- **Name** — Display-only field. This field shows the alphanumeric name of the circuit pack (such as Digital Line).

 **NOTE:**

When the circuit pack physically inserted in the slot differs from what has been administered on this form, a "#" will display between the Sfx and Name fields.

## Implementation notes

[Screen 5-23](#) shows all fields that may display. The fields that appear on a particular screen will vary depending upon the system configuration (Cabinet Layout and Carrier Type) being administered.

The number of Slot fields displayed will vary depending on the system being configured. For R5r and later configurations, the number of Slot fields displayed will represent all administrable slots available for the given Carrier Type. For R5si and later configurations, all possible Slots will display.

## Class of Restriction

---

This form implements classes of restriction (COR). Use a COR to control call origination and termination. A system may have only one COR or as many as necessary to control calling privileges. Up to 96 different CORs (0 through 95) can be assigned. CORs can be assigned to any of the following facilities:

- Attendant Console
- Authorization Codes
- Console Parameters
- Data Module
- Hunt Groups
- Loudspeaker Paging/Code Calling Access
- Remote Access
- Station
- Terminating Extension Group
- Trunk Groups

**NOTE:**

When a call is to a vector directory number (VDN) extension, the COR of the caller and the VDN are compared to determine if the associated Call Vector can be accessed. After the vector is accessed, the COR of the VDN is used for further call permission checking.

Consider the following to enhance your system security:

1. Assign a separate COR to incoming and outgoing trunk groups, then restrict calling between the two groups.
2. Limit the calling permissions as much as possible by setting appropriate Calling Party Restrictions and Facility Restriction Levels (FRLs).

## Administration commands

Use the following commands to administer the Class of Restriction form.

| Action  | Object            | Qualifier <sup>1</sup>       |
|---------|-------------------|------------------------------|
| change  | cor               | 0-95                         |
| display | cor               | 0-95 ['print' or 'schedule'] |
| list    | cor               | 0-95 ['print' or 'schedule'] |
| list    | partitioned group | ['print' or 'schedule']      |

1. Brackets [ ] indicate the qualifier is optional.

## Form instructions

Make assignments as required for the following fields on each page of the form:

### Page 1 of the form

Page 1 of 3

CLASS OF RESTRICTION

COR Number: 10  
 COR Description: supervisor

FRL: 0 APLT? y

Can Be Service Observed? n Calling Party Restriction: outward

Can Be A Service Observer? n Called Party Restriction: none

Time of Day Chart: 1 Forced Entry of Account Codes? n

Priority Queuing? n Direct Agent Calling? n

Restriction Override: none Facility Access Trunk Test? n

Restricted Call List? n Can Change Coverage? n

Unrestricted Call List? \_ \_ \_ \_ \_

Access to MCT? y Fully Restricted Service? n

Category For MFC ANI: 7 Hear VDN of Origin Annc.? n

Send ANI for MFE? n\_ Add/Remove Agent Skills? n

MF ANI Prefix: \_\_\_\_\_ Automatic Charge Display? n

Hear System Music on Hold? y PASTE (Display PBX Data on Phone)? n

Can Be Picked Up By Directed Call Pickup? n

Can Use Directed Call Pickup? n

Screen 5-24. Class of Restriction form (page 1 of 3)

- **COR Number** — Enter a number from **0** through **95** when completing a paper form. This is a display-only field when the form is accessed via an administration command such as **change** or **display**.

- **COR Description** — Enter a description of the COR of up to 35 characters.
- **FRL** — Enter an originating FRL number from **0-7**. AAR and/or ARS features use this entry to determine call access to an outgoing trunk group. Outgoing call routing is determined by a comparison of the FRLs in the AAR/ARS Routing Pattern and the FRL associated with the COR of the call originator (typically, a voice terminal user). An originating FRL of 0 has the least calling privileges. Default is 0 for all CORs except 10 through 17, where the default increments by one from 0 through 7, respectively.

 **NOTE:**

To enhance system security, assign the lowest possible FRL.

- **APLT** — Enter **n** to allow access to APLT trunk group Enhanced Private Switched Communications System (EPSCS) or Common Control Switched Arrangement (CCSA) off-net facilities. Default is **y**.

 **NOTE:**

If fully restricted service is enabled, set this field to **n**.

- **Can Be Service Observed** — Enter **y** if users with this COR can be service observed, otherwise enter **n** (default). Note that this field allows or denies service observing for not only physical extensions, but also for logical agent IDs and VDNs. If you want an observer to observe users, set the users' CORs to **y** on the observer's COR Service Observing Permission table.
- **Can Be a Service Observer** — Enter **y** if users with this COR can service observe other users, otherwise enter **n** (default). If you want an observer to observe users, set the users' CORs to **y** on the observer's COR Service Observing Permission table.

 **NOTE:**

You cannot enter **y** in the previous two fields unless `Service Observing (Basic)` is enabled on the System-Parameters Customer-Options form.

 **CAUTION:**

*The use of Service Observing features may be subject to federal, state, or local laws, rules, or regulations; or require the consent of one or both of the parties to the conversation. Customers should familiarize themselves with and comply with all applicable laws, rules, and regulations before using these features.*

- **Calling Party Restriction** — Enter one of the following commands:
  - **Origination** — Blocks the calling party from originating a call, except Remote Access calls, from the facility at any time. The party can only receive calls.

- **Outward** — Blocks the calling party from directly accessing the exchange network. To enhance security, this is the default.
- **All-toll** — Blocks the calling party from making ARS and trunk access calls from a facility assigned the COR to certain toll areas as defined in the `Dialed String` field on the Toll Analysis form. The `Dialed String` field must be marked as being associated with the system's Toll List. The call completes if the facility's COR also is associated with an Unrestricted Call List and whose `Dialed String` field also matches the dialed number.
- **Tac-toll** — Blocks the calling party from making trunk access calls from the facility assigned the COR to certain toll areas as defined in the `Dialed String` field on the Toll Analysis form. The `Dialed String` field must be marked as being associated with the system's Toll List. The call completes if the facility's COR also is associated with an Unrestricted Call List and whose `Dialed String` field also matches the dialed number. See ["Toll Analysis" on page 5-299](#) for additional information.
- **None** — No calling party restrictions.

 **NOTE:**

To enhance system security, limit calling permissions as much as possible.

The COR can be overridden by the COS. See the `Trk-to-Trk Restriction Override` field documented with the Class of Service feature.

- **Called Party Restriction** — Enter one of the following commands:"
  - **Inward** — Blocks the calling party from receiving incoming exchange network calls, attendant originated calls, and attendant completed calls.
  - **Manual** — Blocks the called party from receiving all calls except for those originated or extended by the attendant.
  - **Public** — Blocks the called party from receiving public network calls. Attendant calls are allowed to go through to the called party as well as attendant-assisted calls if the `Restriction Override` field in the public restricted station's COR is **attd** or **all**.
  - **Termination** — Blocks the called party from receiving any calls at any time.
  - **None** — No called party restrictions.
- **Partitioned Group Number** — This field appears only if `AAR/ARS Partitioning` field is enabled on the System Parameters Customer-Options form and `Time of Day Routing` field is **n**. Enter the AAR/ARS partitioned group number (1 to 8) associated with this COR.

- **Time of Day Chart** — Appears only if `Time of Day` field is enabled on the System Parameters Customer-Options form. Enter the AAR/ARS time-of-day-chart number (1 to 8) associated with this COR.
- **Forced Entry of Account Codes** — Enter **y** to indicate that an account code must be dialed when making outgoing trunk calls. Entering **n** (default) indicates that an account code is not required. As a result of entering a **y**, any voice terminal assigned the associated COR must dial an account code before making an outgoing call. Any trunk group assigned that COR cannot be accessed until an account code is dialed. If a call is being routed by AAR or ARS, account code checking is not done on the COR.

**NOTE:**

To enhance system security, set this field to **y**.

If the `Forced Entry of Account Codes for Toll Calls` field on the System-Parameters Customer-Options form is **y**, `Forced Entry of Account Codes` may also be required for all outgoing calls.

**NOTE:**

If a COR requiring entry of account codes is assigned a VDN, the route to commands executed by the associated vector will not be successful.

- **Priority Queuing** — Enter **y** to allow the voice terminal user's calls to be placed ahead of non-priority calls in a hunt group queue. Default is **n**.

**NOTE:**

If the `ACD Option` field is not enabled on the System-Parameters Customer-Options form, this field must be **n**.

- **Direct Agent Calling** — Enter **y** to allow a user to originate or receive direct agent calls. Use this whenever a user talks directly with a specific ACD agent, not just anyone in the agent pool. If the system is in Night Service, the call routes to the Night Service extension. Default is **n**.
- **Restriction Override** — Enter the type of user who is allowed to bypass restriction on the conference/transfer or call forwarding operations. Valid entries are **all**, **attendant**, or **none**. To enhance security, default is **none**.
- **Facility Access Trunk Test** — Enter **y** to allow Facility Access Trunk Tests (FAT). Test calls from facilities (for example, voice terminals) will be allowed to complete if their `COR FAT` field is **y**. For calls from facilities whose `COR FAT` field is **n**, intercept treatment will be given. An associated feature button ("trk-ac-alm") status lamp lights when a successful FAT access occurs. Pressing one of the alarm buttons (ten maximum) when its associated status lamp is lit turns off all lamps on all buttons whether the access is still in progress or has completed. Default is **n**.

- **Restricted Call List** — Enter **y** to specify that this COR will have access to the system's Restricted Call List (see Toll Analysis on page [5-299](#)). This list can be used whether the COR is toll restricted. The Restricted Call List (RCL) has priority over the Toll Analysis Unrestricted Call List (UCL). A call attempt from a facility assigned a COR (with `RCL` field set to **y**), whose dialed digit string is on the Toll Analysis form and is marked as being associated with the RCL, will be denied. Default is **n**.
- **Can Change Coverage** — Enter **y** to allow station users with this COR to select one of two previously administered coverage paths or to activate, change, or deactivate call forward all calls or call forward busy/don't answer from any on-site or off-site location.
- **Unrestricted Call List** — Displays when `Calling Party Restriction` is **all-toll** or **tac-toll**. This field allows a user to complete a toll call with "restricted" dialed digits. This field is associated with the `Dialed String` field on the Toll Analysis form. An Unrestricted Call List number is denoted on that form.

Any entries on the Toll Analysis form with an "X" in the Toll List column is "restricted." You cannot complete a restricted call. However, this field overrides that restriction.

For example, if the Toll Analysis form shows a `Dialed String` column entry of 538 and there is an "X" in the Toll List column, the 538 number is restricted. To override this restriction, in the Toll Analysis form, enter **X** in the "5" column under the Unrestricted Call List heading. In the Class of Restriction form, in this field, enter **5** to complete the restriction override.

- **Access to MCT?** — This field refers to Malicious Call Trace. Enter **y** (default) to allow permissions to activate a request to trace a malicious call. Entering **n** does not prevent a station from making entries to the MCT History report.
- **Fully Restricted Service** — When **y** entered for a given COR, stations assigned that COR will not have access to the public network for either incoming or outgoing calls.

**NOTE:**

If this field is enabled, the `APLT` field must be **n**.

- **Category For MFC ANI** — The `Calling Party Category` digit administered in this field is included as part of the ANI information sent to the Central Office on request using R2-MFC signaling. Valid entries are **1** through **10**. Default is **7** (used in other than U.S.).
- **Hear VDN of Origin Announcement** — Enter **y** if users with this COR can receive VDN of Origin messages. Enter **n** to deny the ability to receive VDN of Origin messages.

- **Send ANI for MFE** — Only applicable for Spain. Enter **y** to enable Automatic Number Identification (ANI). When the value is **y**, the PBX sends the calling party's number to the public or IBERCOM network for line charging; **n** indicates block charging. Valid for 2/6 signaling, but not 2/5 signaling.

**NOTE:**

The following field appears only if `Expert Agent Selection (EAS)` is enabled on the Feature-Related System-Parameters form.

- **Add/Remove Agent Skills** — Enter **y** to allow users with this COR to add and remove skills. Enter **n** to prevent use of this feature.
- **MF ANI Prefix** — This field defines the prefix to apply to an extension number when ANI is sent to the CO. This overrides any ANI prefix administered on the Multifrequency Signaling form. This does not apply when ANI is tandemed through the PBX on tandem calls or when ANI for PBX is sent. Valid entry is 1 to 7 digits. Default is blank.
- **Automatic Charge Display** — Enter **y** if you use Advice of Charge or Periodic Pulse Metering and you want call charges to display automatically on users' display sets. Default is **n** (used in other than U.S.).
- **Hear System Music on Hold** — Enter **y** (default) to allow the Music on Hold feature to be activated by a terminal. Enter **n** to prevent use of the feature.
- **PASTE (Display PBX Data on Phone)** — Enter **y** to download all lists. Enter **n** (default) to disallow the PASTE feature.
- **Can Be Picked Up By Directed Call Pickup** — Enter **y** to allow this Station's or EAS agent's calls to be picked up by using the Directed Call Pickup Up feature. Enter **n** (default) to prevent the use of the feature. Set `Directed Call Pickup` on the Feature-Related System Parameters form to **y** to set this field to **y**.
- **Can Use Directed Call Pickup** — Enter **y** to allow the station, attendant, or EAS agent to pick up calls using the Directed Call Pickup feature. Enter **n** (default) to prevent them from using the feature. Set `Directed Call Pickup` on the Feature-Related System Parameters form to **y** to set this field to **y**.

## Implementation note

---

The `Category` for `MFC ANI` field always controls categories for Russian signaling trunks. It also may control categories for R2-MFC signaling trunks, depending on what value is in the `Use COR for Calling Party Category` field on the system-parameters multi-frequency form.

The `Unrestricted Call List` field displays only when the `Calling Party Restriction` field is **All-toll** or **Tac-toll**. Valid entries are **1** through **10** or blank (default).

#### Screen 5-27. Class of Restriction Information

This form displays information about a COR or a range of CORs. To access this form, enter the command `list cor 10` to display information for a single COR or enter `list cor cor 10 to-cor 20` to display a range of COR numbers. The `print` and `schedule` options support this `list cor` command. If the `list cor` command executes without arguments, all assigned CORs display.

## Class of Service

This form administers access permissions for call processing features that require dial code and/or feature button access permission.

**⇒ NOTE:**

Class of Service (COS) does not apply to trunk groups except for the Remote Access feature.

A COS assignment defines whether or not a voice terminal user may access or use the following features and functions. Up to 16 different COS numbers may be administered (0 through 15).

### Administration commands

Use the following commands to access the Class of Service form.

| Action  | Object | Qualifier <sup>1</sup>  |
|---------|--------|-------------------------|
| change  | cos    | —                       |
| display | cos    | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional.

Make assignments as required on the form:

The form lists the default values for each COS/feature combination. For a particular combination, **y** allows access to the feature and **n** denies access. Assign entries on the form for each COS to be implemented. Default values are shown on the form.

 **NOTE:**

To enhance system security, limit calling permissions as much as possible.

- **Automatic Callback** — (feature)
- **Call Forwarding All Calls** — (feature)
- **Data Privacy** — (feature)
- **Priority Calling** — (feature)
- **Restrict Call Fwd-Off Net** — (feature)
- **Call Forwarding Busy/DA** — (feature)
- **Personal Station Access** — (feature)
- **Console Permission** — (allows multi-appearance voice terminal users to control the following features normally controlled by the attendant):
  - Automatic Wakeup
  - Controlled Restrictions
  - Do Not Disturb
  - Call Forwarding All Calls
  - Integrated Announcement Recording
- **Off-Hook Alert** — (See [“Emergency Access to the Attendant”](#) feature). Requires that either the `Hospitality (Basic)` or `Emergency Access to Attendant` field (optional features) be enabled on the System-Parameters Customer-Option form.
- **Client Room** — (See [“Hospitality Services”](#) — allows use of the Check-In, Check-Out, Room Change/Swap, and Maid Status features). Requires that the `Hospitality` field (optional feature) be enabled on the System-Parameters Customer-Option form. When Client Room is **y**, a user must dial a feature access code (FAC) and then the extension when activating a feature.
- **Personal Station Access** — You cannot change a COS for this field to **y** if `Personal Station Access (PSA)` on the System Parameters Customer-Options form is **n**.
- **Extended Forwarding All** — You cannot change a COS to **y** if `Extended Cvg/Fwd Admin` on the System Parameters Customer-Options form is **n**.

- **Extended Forwarding B/DA** — You cannot change this COS to **y** if Extended Cvg/Fwd Admin on the System Parameters Customer-Options form is **n**.
- **Trk-to-Trk Restriction Override** — If set to **y**, this field supersedes any system and/or COR-to-COR calling party restrictions that would otherwise prohibit the trunk-to-trunk transfer operation for users with this COS.
- **QSIG Call Offer Originations** — For outgoing call offer call originations, set to **y**. Default is **n**.

## Code Calling IDs

The Code Calling IDs form assigns extensions to code calling identification numbers. As many as 125 three-digit chime codes can be provided. Only one extension can be assigned to each chime code. The system translates the ID number associated with a code calling extension to a chime code and then plays the code over a zone loudspeaker as assigned on the Loudspeaker Paging form.

### Administration commands

Use the following commands to administer the Code Calling IDs form.

| Action  | Object                  | Qualifier <sup>1</sup>  |
|---------|-------------------------|-------------------------|
| change  | paging code-calling-ids | —                       |
| display | paging code-calling-ids | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

Screen 5-29. Code Calling IDs form (page 1 of 2)

Make assignments as required for the following fields on each page of the form:

- **Ext** — Enter an assigned or unassigned extension (may not be a VDN extension). The extension, when dialed using Code Calling Access, causes an associated chime signal to be broadcast over the associated zone loudspeaker. Leave this field blank if you do not want to assign a code.

## Console-Parameters

This form administers attendant console group parameters. This includes basic parameters for Centralized Attendant Service (CAS) and Inter-PBX Attendant Service (IAS). A list of the administered attendant consoles also displays on this form.

### Administration commands

Use the following commands to administer the Console-Parameters form.

| Action  | Object             | Qualifier <sup>1</sup>  |
|---------|--------------------|-------------------------|
| change  | console-parameters | —                       |
| display | console-parameters | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional.

### Form instructions

Make assignments as required for the following fields on each page of the form:

```

- **Attendant Group Name** — Enter the name (up to 27 characters) of the attendant group.
- **COS** — Enter a class of service (COS) number (0 through 15) that reflects the desired features for the attendant. Default is 1.
- **COR** — Enter the class of restriction (COR) number (0 through 95) that reflects the desired features for the attendant. Default is 1.
- **Calls In Queue Warning** — Enter the number of incoming calls that can be in the attendant queue before the console's second Call Waiting lamp lights. The console's first Call Waiting lamp lights when any incoming calls are waiting to be answered. The second lamp lights when the number of calls waiting equals the value you entered in the Calls in Queue Warning field.
- **Attendant Lockout** — Enter **y** (default) to activate the Privacy — Attendant Lockout feature. If **y** is entered, the attendant is prohibited from reentering a conference call that has been placed on hold unless recalled by a voice terminal user on the call.
- **Ext Alert Port (TAAS)** — Enter the seven-digit port number assigned to the external alerting device. This supports the Night Service — Trunk Answer From Any Station feature.

The entry breaks down as follows:

| Characters | Meaning        | Value                                     |
|------------|----------------|---|
| 1-2        | Cabinet Number | 01 through 22                             |
|            |                | 01 through 03                             |
|            |                | 01 (G3s)                                  |
| 3          | Carrier        | A through E                               |
| 4-5        | Slot Number    | 01 through 20                             |
| 6-7        | Circuit Number | 01 through 08 (Digital Line circuit pack) |

**NOTE:**

When using the Administration Without Hardware feature, place an "X" in this field to indicate that there is no hardware associated with this port assignment.

**NOTE:**

If an **X** is used here, you must also fill in the Ext Alert (TAAS) Extension field.

- **Ext Alert (TAAS) Extension** — Displays only when an **X** is entered in the Ext Alert Port (TAAS) field. This extension is used by the Terminal Translation Feature (TTI) to assign a port to the Ext Alert Port from a terminal on the Ext Alert port during system installation or provisioning.

Once a port is assigned (either via TTI or by changing the `Ext Alert Port` field from the G3-MA or other manager terminal) the extension is automatically removed and treated as unassigned.

- **CAS** — Enter **main**, **branch**, or **none** (default).

**NOTE:**

The `CAS Main` or `Branch` features must be enabled on the System-Parameters Customer-Options form for either of these features to be functional here.

- **SAC Notification** — Enter **y** to enable or **n** (default) to disable Enhanced Attendant Notification for Send All Calls.
- **RLT Trunk Group No.** — Appears only when **branch** is entered in the `CAS` field. Enter the trunk group number corresponding to the Release Link Trunk (RLT) trunk group to the main location when supporting CAS Branch service.
- **CAS Back-Up Ext.** — Appears only when "**branch**" is entered in the `CAS` field. This field handles attendant-seeking calls if the RLT trunk group to the CAS Main PBX is out of service or if CAS Back-Up is activated. This field must be explicitly defined as an extension in the dial plan. Neither a prefixed extension nor a VDN extension is allowed. Valid entries are an extension number for a station, individual attendant console, hunt group, TEG, or blank.
- **Night Service Act. Ext.** — A display-only field that contains the extension of the current night service activation station, if any. Such a station is administered by assigning it a "night-serv" button.
- **IAS (Branch)** — Enter **y** to enable or **n** (default) to disable the Inter-PBX Attendant Service (IAS) Branch feature.

**NOTE:**

`CAS` and `IAS` cannot both be active at the same time.

- **IAS Tie Trunk Group No.** — Enter the number of the tie trunk group to the main for the IAS (Branch). This entry is required when `IAS Branch` is **y**.
- **IAS Att. Access Code** — Enter the extension number of the attendant group at the main PBX. This entry is required when `IAS Branch` is **y**.
- **Alternate FRL Station** — Displays the extension of the alternate FRL activation station.
- **Backup Alerting** — Enter **y** to activate this feature. This means that system users can pick up alerting calls if the attendant queue has reached its warning state. An **n** (default) indicates that the feature is not active.
- **DID-LDN Only to LDN Night Ext.** — Enter **y** to allow only listed directory number (LDN) calls to go to the listed directory night service number extension; otherwise, enter **n** (all attendant seeking calls will be routed there). Default is **n**.

- **Timed Reminder on Hold (sec)** — Enter the time in seconds (**10** through **1024**) that a call remains on hold at the console before the attendant is alerted. In a CAS arrangement, the main and the branch consoles (when administered) should be administered the same. Default is **10**.
- **Return Call Timeout (sec)** — Enter the time in seconds (**10** through **1024**) before a split away call (call extended and ringing a station or otherwise split away from the console) returns to the console, or leave blank. Default is **10**.
- **Time In Queue Warning (sec)** — Enter the number of seconds a call can remain in the attendant queue before activating an alert. Valid entries are **0** through **999** or blank.
- **No Answer Timeout (sec)** — Enter the number of seconds (**10** through **1024**) a call to the attendant can remain unanswered without invoking a more insistent sounding tone, or leave blank.
- **Alerting (sec)** — Enter the number of seconds (**10** through **1024**) after which a held or unanswered call is disconnected from an attendant loop and routed to another attendant or night service.
- **List1, List2, List3** — Enter **system**, **group**, or **enhanced** for each List # as required. If **group** is entered, a subfield for the group number displays. The subfield's default is **1**. Abbreviated Dialing Personal Lists cannot be assigned.
- **Secondary Alert on Held Reminder Calls?** — Enter **y** to begin attendant alerting for Held Reminder Calls with secondary alerting. Enter **n** to have held reminder calls alert the attendant the same as normal calls. Normal calls start with primary alerting and switch to secondary alerting when the No Answer Timeout expires.

**COMMON SHARED EXTENSIONS** — Provided to the attendant group or terminals with console permissions for parking calls. Common Shared Extensions are administered using two fields: a starting extension of the common shared block and the number of common shared extensions in the block.

- **Starting Extension** — Enter an unassigned extension number that conforms to the Dial Plan. These extension numbers can be used by the attendant to park calls.
- **Count** — Enter a number to indicate the number of consecutive extensions, beginning with the Start Extension to be used as common, shared extensions.

These extension numbers, with no physical voice terminals assigned, are used by the attendant to park calls. For example, if you enter 4300/3, the system makes three consecutive extension numbers, 4300, 4301, and 4302, available to the attendant to park calls.

The extensions should be assigned to the optional Attendant Selector Console in the 00 through 09 block (bottom row) in any hundreds group for easy identification by the attendant. The lamp associated with the number will identify "call parked" or "no call parked", instead of busy or idle status.

## Page 2 of the form

CONSOLE PARAMETERS

QUEUE PRIORITIES

- Emergency Access:1\_
- Assistance Call:2\_
- CO Call:2\_
- DID to Attendant:2\_
- Tie Call:2\_
- Redirected DID Call:2\_
- Redirected Call:2\_
- Return Call:2\_
- Serial Call:2\_
- Individual Attendant Access:2\_
- Interpositional:2\_
- Miscellaneous Call:2\_

Call-Type Ordering Withn Priority Levels? n

### Screen 5-31. Console Parameters — Default Attendant Group form (page 2 of 3)

- **Queue Priorities** — Assign a priority level of **1** through **12** to the calls listed below. You may assign the same priority level to more than one call. Priority 1 is the highest priority and is the default for Emergency Access.
  - Emergency Access
  - Assistance Call
  - CO Calls
  - DID to Attendant
  - TIE Call
  - Redirected DID Call
  - Redirected Call
  - Return Call
  - Serial Call
  - Individual Attendant Access
  - Interpositional
  - Miscellaneous Call

- **Call-Type Ordering Within Priority Levels?** — Enter **n** if you wish the calls to be presented in chronological order within the priority levels that you established above under Queue Priorities.  
Enter **y** if you want to present calls by call type. The three call types are:
  - Type 1 — Answered public network
  - Type 2 — Unanswered public network
  - Type 3 — All others (internal, conference, private network, etc.)
- If you chose this option, calls will first be grouped by the priority level that you established above under Queue Priorities, then by call type, and, finally, in the order received.

CONSOLE PARAMETERS

ASSIGNED MEMBERS ( Installed attendant consoles )

| Type | Grp | TN |
|------|-----|----|
| 1:   | 1   | 1  |
| 2:   | 1   | 1  |
| 3:   | 1   | 1  |
| 4:   | 1   | 1  |
| 5:   | 1   | 1  |
| 6:   | 1   | 1  |
| 7:   | 1   | 1  |

### Screen 5-32. Console Parameters — Default Attendant Group form (page 3 of 3)

- **ASSIGNED MEMBERS (Installed attendant console types)** — Display-only field. A list of all attendants in the group will be displayed. Individual attendant consoles are administered using the Attendant Console form.
- **Grp** — This display-only field contains the Attendant Group number.
- **TN** — This display-only fields contains the Tenant Partition number.

### Implementation note

---

The number of fields will vary based on the maximum number of attendant consoles allowed for your system configuration.

## Coverage Answer Group

---

This form establishes Call Coverage Answer Groups.

An answer group contains up to eight members who act as a coverage point for another user. For example, if several secretaries are responsible for answering a department's redirected calls, all the secretaries could be assigned to an answer group. The answer group is assigned a group number, and that group number appears in the department's coverage path. All terminals in an answer group ring (alert) simultaneously. Any member of the group can answer the call.

Each coverage answer group is identified by a number from 1 through the maximum number allowed by your system configuration (see *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference*). The members of the group are identified by their extension number. Any installed voice terminal (but not attendants) can be assigned to a coverage answer group.

### Administration commands

---

Use the following commands to administer the Coverage Answer Group form.

| Action  | Object                | Qualifier <sup>1</sup>                           |
|---------|-----------------------|--|
| add     | coverage answer-group | 1-MAX (or 'next')                                |
| change  | coverage answer-group | 1-MAX  |
| display | coverage answer-group | 1-MAX ['print' or 'schedule']                    |
| list    | coverage answer-group | [1-MAX]['number' x]['to-number' x]<br>['name' x] |
|         |                       | ['count' n]['print' or 'schedule']               |
| remove  | coverage answer-group | 1-MAX  |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the maximum number available in your system configuration.

COVERAGE ANSWER GROUP

Group Number: \_\_\_\_\_  
Group Name: COVERAGE\_GROUP\_

GROUP MEMBER ASSIGNMENTS

|    | Ext   | Name  |    | Ext   | Name  |
|----|-------|-------|----|-------|-------|
| 1: | _____ | _____ | 5: | _____ | _____ |
| 2: | _____ | _____ | 6: | _____ | _____ |
| 3: | _____ | _____ | 7: | _____ | _____ |
| 4: | _____ | _____ | 8: | _____ | _____ |

### Screen 5-33. Coverage Answer Group form (page 1 of 1)

Make assignments as required for the following fields on the form:

- **Group Number** — Enter a group number when completing a paper form. This is a display-only field when the form is accessed using an administration command such as **add** or **change**.
- **Group Name** — Enter the group name you want to use to identify this group. Up to 27 characters can be used, for example, typing pool, room 12, secy, and so on. Default is **COVERAGE GROUP**.

#### NOTE:

Performance Tip — Enter the extension numbers that are group members. This allows a list coverage answer group command to be used to list the voice terminals that will be alerted. The list command can be used in conjunction with the list station, list coverage path, and list hunt group commands to determine stations involved in call coverage. This makes it possible to follow call coverage for any extension, allowing the administrator to easily track call coverage paths.

- **Ext** — Enter the extension number (may not be a Vector Directory Number extension) for each member of this coverage answer group.
- **Name** — Display-only field. The name is assigned when the member's voice terminal is administered.

## Coverage Path

This form implements Call Coverage Paths. The form includes the don't answer time interval (number of rings), the call coverage criteria, and the points in the coverage path used to redirect calls.

Call coverage provides internal system users with automatic redirection of calls to answering positions. Both internal and outside calls may be redirected to coverage.

### Administration commands

Use the following commands to administer the Coverage Path form.

|   | Action  | Object        | Qualifier <sup>1</sup>   |
|---|---------|---------------|--|
| Without Hospitality<br>Parameter<br>Reduction Feature | add     | coverage path | 1-MAX (or 'next')  |
|   | change  | coverage path | 1-MAX  |
|   | display | coverage path | 1-MAX ['print' or 'schedule']  |
|   | list    | coverage path | [1-MAX]['path' x]<br>['to-path' x]['count' n]<br>['print' or 'schedule'] |
|   | remove  | coverage path | 1-MAX  |
| With Hospitality<br>Parameter<br>Reduction Feature    | add     | coverage path | 1-5 (or 'next')  |
|   | change  | coverage path | 1-5  |
|   | display | coverage path | 1-5 ['print' or 'schedule']  |
|   | list    | coverage path | [1-5]['path' x]<br>['to-path' x]['count' n]<br>['print' or 'schedule']   |
|   | remove  | coverage path | 1-5  |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the maximum number available in your system configuration.

Point1: \_\_\_ Point2: \_\_\_ Point3: \_\_\_  
 Point4: \_\_\_ Point5: \_\_\_ Point6: \_\_\_

**Screen 5-34. Coverage Path form (page 1 of 1)**

Make assignments as required for the following fields on the form:

- **Coverage Path Number** — This is a display-only field if the form is accessed using an administration command such as display, add, or change. If the `Hospitality Parameter Reduction` option is enabled on the `System-Parameters Customer-Options` form, only five (maximum) coverage paths can be assigned in the system.
- **Hunt After Coverage** — Enter **y** if you want the system to attempt Station Hunting from the last coverage point, if the coverage point is a busy station. Default is **n**.
- **Next Path Number** — Enter the number of the coverage path to which a call will be redirected in case of coverage failure (the path's coverage criteria does not match the call status) at the current path. If the next path's coverage criteria matches the call status, that path is used to redirect the call and no other path is searched.
- **Linkage** — A display-only field that shows up to two additional coverage paths, when assigned, that `Next Path Number` entry is linked to. A typical linkage example is provided in this section. Six Coverage Paths (1, 2, 3, 4, 5, 6) are shown.
- **COVERAGE CRITERIA** are the conditions that, when met, cause the call to redirect to coverage. Assign one of the following:
  - Active — At least one call appearance is busy.

- Busy — Only one call appearance is idle. If `Restrict Last Appearance` is `n` on the Station form, then no call appearances are idle.
- Don't Answer — The number of rings has exceeded the preset number.
- All — Users with this path assigned will never answer their own calls; instead, all calls go immediately to coverage.
- DND/SAC/Goto Cover — DND(Do Not Disturb)/SAC/Goto Cover allows users to activate `Send All Calls` and to temporarily direct all incoming calls to coverage regardless of the assigned Call Coverage redirection criteria. This feature also allows covering users to temporarily remove their voice terminals from the coverage path.
- **Active, Busy, Don't Answer, All and DND/SAC/Goto Cover** — Enter a "y" to activate. This specifies the condition that, when met, causes a call to redirect to coverage.
- **Number of Rings** — Enter the number of rings from **1** through **99**. Three rings is the recommended timing. This is the number of rings a user's voice terminal rings before the system sees a "no answer" condition and sends the call to the first coverage point. Default is 3.
- **Terminate to Coverage Pts. with Bridged Appearances** — Set to `y` to allow a call to alert as both a bridged call and a redirected call. Set to `n` (default) for the call to skip the coverage point if it has already alerted as a bridged call.
- **COVERAGE POINTS** — Allows you to define the Call Coverage Paths. Coverage points must be assigned sequentially beginning with Point 1 (do not leave gaps).

Each coverage path can have up to six alternate answering points, any of which can be

- A voice terminal or individual attendant (an extension number of a user who will be responsible for answering another user's redirected calls)
- Any off-net public number (see ["Remote Call Coverage Table" on page 5-263](#))
- Recorded Announcement
- Audio Information Exchange (AUDIX)
- A Hunt Group Number
- A Coverage Answer Group Number

- The Attendant Group ("attd")
- A vector Directory Number (only the last)

**NOTE:**

A Vector Directory Number may be translated as the last administered point in a coverage path.

When entering coverage points information, use the following notations:

- The letter "h" to indicate hunt, followed by a hunt group number. For example, enter "h32" if you want a coverage point routed to hunt group number 32.
  - The letter "c" to indicate coverage answer group followed by the coverage answer group number. For example, enter "c20" if you want a coverage point routed to call coverage answer group 20.
  - The letter "r" to indicate remote coverage point followed by the remote coverage point number. For example, enter "r27" if you want a coverage point routed to remote coverage point 27.
  - The letter "v" to indicate VDN followed by the VDN extension number. For example, enter "v12345" if you want the last administered coverage point to be the VDN associated with extension 12345.
  - "Attd" if you want a coverage point to be the attendant group.
  - The extension number assigned to a voice terminal, announcement.
- **Point1, Point2, Point3, Point4, Point5, Point6,** — Enter one of the following:
- An extension number for the voice terminal or announcement
  - "attd" for the attendant group
  - h1 through h255 for a hunt group
  - c1 through c750 for a coverage point
  - r1 through r999 for a remote coverage point
  - v+extension (e.g., v12345) for a VDN

If calls redirect to an AUDIX in a DCS network, administer a unique Hunt Group form. Assign the AUDIX extension in the `Group Extension` field. If the AUDIX is connected to the local node, set the `Message Center` field to **audix**; if the AUDIX is connected to another node, set the `Message Center` field to **rem-audix**.

If you set this field to **attd** and the system has Centralized Attendant Service (CAS), the call goes to the CAS attendant.

If calls redirect to Message Center (a special Uniform Call Distribution hunt group), AUDIX, or to the attendant, do not list any additional coverage points. These calls will normally queue and never redirect to another coverage point. Calls to any hunt group will queue if possible. Calls redirect from a hunt group only if all hunt group members are busy and either the queue is full or there is no queue.

If the Coverage of Calls Redirected Off-Net feature is not enabled, a remote coverage point will function as the last point in the coverage path, because the system will no longer have control of the call once it is redirected off-net. However, if the Coverage of Calls Redirected Off-Net feature is enabled, a call redirected off-net can be monitored by the system and brought back for further call coverage processing.

## Dial Plan Record

The Dial Plan is the system's guide to translating the digits dialed by various System users. Both the Dial Plan Record and the Second Digit Table forms define your system's dial plan. Typical Dial Plan examples are shown for both Single-Digit and Mixed Station Numbering.

### Administration commands

Use the following commands to administer the Dial Plan Record form.

| Action  | Object   | Qualifier <sup>1</sup> |
|---------|----------|------------------------|
| change  | dialplan | —                      |
| display | dialplan | [print or schedule]    |

1. Brackets [ ] indicate the qualifier is optional.

| #:          | _____ | _____ | _____ | _____ | _____ | _____ |

Screen 5-35. Dial Plan Record form (page 1 of 1)

Make assignments as required for the following fields on the form:

- **North American Area Code** — Required only in North America. Enter the area code number where the System is located. Valid entries are any area code in the form NXX where N is any digit 2 through 9 and X is any digit 0 through 9. Entry must be all digits. Leave blank if not in North America.
- **Local Node Number** — Enter a number from **1** through **63** to uniquely identify a node in a PBX network. The Node Number is used by the automatic restoration capability of Administered Connections. This entry must match the Distributed Communications System (DCS) switch node number and the CDR node number if they are specified. The field may be left blank if automatic restoration, DCS, and CDR are not used.
- **ETA Node Number** — Enter the number of the destination switch for ETA calls.
- **ETA Routing Pattern** — Enter the number of the routing pattern to reach the destination switch.
- **ARS Prefix 1 Required** — Only displays if *North American Area Code* is not blank. Enter **y** (default) if dialing a "1" is required to call an area code. Enter **y** if the office codes in the HNPA are interchangeable with NPAs. Requiring a "1" Prefix typically is used within those area codes where local central office codes resemble area codes (that is, middle digit is a "0" or a "1"). For example, 201 in New Jersey, or 212 in New York.
- **Uniform Dialing Plan** — Enter **4-digit** or **5-digit** to signify the use of a 4- or 5-digit Dial Plan, or **none** (default) if no Uniform Dialing Plan (UDP) is to be administered.

**NOTE:**

The *Uniform Dialing Plan* field must be enabled on the System-Parameters Customer-Option form before any entry other than **none** can be entered in this field.

The Uniform Dialing Plan is a separate form that must be administered if **4-digit** or **5-digit** is entered in this field. See [“Uniform Dial Plan Form” on page 12-121](#) for more information.

**CAUTION:**

*If the entry in the Uniform Dialing Plan field is changed from its previously administered value, all UDP extension codes will be lost.*

The UDP provides a common 4- or 5-digit dial plan that can be shared among a group of switches. Interswitch dialing and intraswitch dialing both require 4- or 5-digit dialing. The UDP is used with Electronic Tandem Network (ETN), Main/Satellite/Tributary, and DCS configurations. Additionally, UDP can be used alone to provide uniform 4- or 5-digit dialing between two or more private switching systems without ETN, DCS, or Main/Satellite/Tributary configurations.

 **NOTE:**

Local extensions of fewer digits can still be administered, but cannot be reached from other switches.

- **UDP Extension Search Order** — Displays when `Uniform Dialing Plan` is **4-digit** or **5-digit**. Indicates where the system should look for a dialed extension first. Valid entries are **local-extensions-first** (default) and **udp-table-first**.

When "**local-extensions-first**" is selected, the dialed extension will be searched for in local translation first. If found, the call terminates to the local station. If the extension is not found locally, the UDP tables will be searched for an off-switch (UDP) conversion.

When "**udp-table-first**" is selected, the UDP tables will be searched first.

- **First Digit table** — This table consists of fields for each possible first digit and dialed number length. The first digit ranges from **0** through **9** plus the \* (star) and # (pound) symbols. The dialed digit length ranges from **1** through **6**. Enter one of the following values in each field on the table (referred to as dial types):

- blank (no object is assigned) — All fields default to blank.
- **extension** (primary extension) — Can have a first digit of 0 through 9 (\* and # not allowed) and can be 1 to 5 digits in length.

For example, if extensions 400 through 499 are required, **extension** is entered at the intersection of the "-3-" column and the First Digit "4" row. If a 4-digit number is administered with a first digit of 6, the extension numbers 6000 through 6999 will be allowed (**extension** is entered at the intersection of the "-4-" column and the First Digit "6" row). Note the **extension** cannot have the same first digit as the ARS or AAR facility access code (FAC).

 **NOTE:**

If the Uniform Dialing Plan is enabled, it is recommended that no extensions be administered that begin with **0**. In the United States of America, **0** is usually the attendant.

- **fac** (feature access code) — Can have a first digit of **0** through **9** plus the \* (star) and # (pound) symbols. A FAC can be from one to four digits in length. The \* and # symbols each count as a digit when used and must be the first digit. For example, \*2 could be used to activate a feature and #2 used to deactivate the feature. It is recommended that a FAC be the last item entered in a row when mixed numbering is used. Otherwise, problems may be encountered when 3-digit FACs and 4-digit extension numbers begin with the same first digit and the FAC is an abbreviated dialing list access code. If the abbreviated dial list entry that a user wants to dial in on a station feature button, no problems will be encountered in dialing. If you manually dial the access code and

the list entry number, you must wait for the inter-digit time-out to expire after dialing the list access code and before dialing the list entry number. Otherwise, the call will go to intercept or to an extension number.

The system requires that FACs for AAR and ARS have the longest length for a first digit in the First Digit Table.

- **dac** (dial access code) — Can have a first digit of **0** through **9** (plus the \* and # symbols) and be from one to four digits in length.

The system requires that a DAC have the longest length for a first digit in the First Digit Table.

You can use the dial access code (DAC) to activate or deactivate a switch feature or to seize a trunk from a trunk group, or both. In the first case, the DAC functions as a feature access code, in the second as a trunk access code.

You can use 4-digit DACs for ordinary trunk access, but they do not work for attendant control of trunk groups, trunk-ID buttons, or DCS, and only the last 3 digits of the codes can be recorded in CDR records. A DAC *must be the last item entered* in a row when mixed station numbering is used.

- **attd** — The attendant group number can be administered for dialed length of 1, and can have a first digit of **0** through **9**, or the two-digit attendant group number whose first digit is defined as "misc" and whose second digit (**0** through **9**) is defined on the Second Digit Table form.
- "misc" — Can have a dialed length of 1, and can have a first digit of **0** through **9**. This call type specifies that the call types for this digit are actually determined in the Second Digit Table.
- "pextension" — Is made up of a prefix (first digit) that can be a **0** through **9** (\* and # not allowed) and an extension number of up to five digits in length. The maximum length of a prefix and extension combination is six digits. When a prefixed extension is entered in the dial plan, a TAC cannot be entered before the prefixed extension on the same row in the table. If a first digit is already assigned as a TAC, a prefixed digit cannot be entered after the tac on the same row in the table. The purpose of the prefix is to identify the dial type as an extension. After digit collection, the prefix digit is removed from the string of dialed digits. The remaining digits (extension number) are then processed. A prefixed extension allows the use of extensions numbers with any first digit (the extension length must be specified on the table). The "prefixed extension" cannot have the same first digit as the ARS or AAR facility access code (FAC).

 **NOTE:**

When a dial plan has mixed station numbering, extensions of various lengths (all with the same first digit) are mapped on

the First Digit table as shown on Page 1 of the form. The system then employs an inter-digit time-out to ensure that all dialed digits are collected. The inter-digit time-out may add several seconds to the dial time. An alternative to the delay required in the time-out mechanism at the expense of dialing an extra digit is to use prefixed extensions in the dial plan.

 **WARNING:**

*Changing from 4 digit to 5 digit (and vice versa) Uniform Dialing Plan will cause all UDP extension codes to be removed.*

## Duplication-Related System Parameters

---

**⇒ NOTE:**

This form only applies to R5r and later configurations.

Used to enable or disable operation of Switch Processing Element (SPE) and Port Network Connectivity (PNC) duplication. The following must be duplicated:

- Each switch node record and every switch node with its duplicate (cabinet administration is a prerequisite)
- Every fiber link containing either an expansion interface circuit pack as an endpoint, or a DS1C (fiber link administration is a prerequisite; circuit pack administration then follows duplication administration)

All nonduplicated switch node interfaces (SNI) to SNI fiber links are automatically duplicated.

**⇒ NOTE:**

The PNC Duplication field must be enabled with the *system-parameters customer-options* command before any duplication administration can be performed.

### Administration commands

---

Use the following commands to administer the Duplication-Related System Parameters form.

| Action  | Object                        | Qualifier |
|---------|-------------------------------|-----------|
| change  | system-parameters duplication |           |
| display | system-parameters duplication |           |

### Form instructions

---

```
DUPLICATION-RELATED SYSTEM PARAMETERS
Enable Operation of SPE Duplication? y
Enable Operation of PNC Duplication? y
```

Make assignments as required for the following fields on the form:

- **Enable Operation of SPE Duplication** — Enter **y** to enable or **n** (default) to disable operation of SPE duplication.
- **Enable Operation of PNC Duplication** — Enter **y** to enable or **n** (default) to disable operation of PNC duplication. This field appears only if `PNC Duplication` has been enabled on the System-Parameters Customer-Options form.

PNC Duplication cannot be enabled until all pnc-a and pnc-b boards are released from the “busyout” state and duplicate TN2238s have been administered for every port network.

Once enabled, PNC Duplication cannot be disabled until all pnc-a boards are made active and all pnc-b boards are in the “busyout” state.

## ETA Call Screening Table

This form allows a set of digit strings to be identified that should not be routed via Extended Trunks Access (ETA). This form can also block the routing of certain FACs or TACs. For example, if the system administrator were to notice a digit string being mistakenly dialed repeatedly that ended up being routed via ETA to a remote PBX only to have the remote PBX returning intercept treatment, then that digit string would be a candidate for the entry into the ETA call screening table. Entry into this table would have the effect of return intercept treatment to the caller without first attempting to route the digits to the remote PBX for interpretation via ETA.

### Administration commands

Use the following commands to administer the ETA Call Screening form.

| Action  | Object         | Qualifier <sup>1</sup> |
|---------|----------------|------------------------|
| change  | call-screening |                        |
| display | call-screening |                        |

1. Brackets [ ] indicate the qualifier is optional.

### Screen 5-38. Malicious Call Trace form (page 1 of 1)

Make assignments as required for the following fields on the form:

- **1-100** — Assign an extension assigned to an extension or attendant that will have an MCT-Control Button.

## External Device Alarm

This form administers External Device Alarm. You need to identify the port, the external device connected to the port (including Product Identifier), and the alarm level assigned to the external device for each alarm connection. You can assign an alarm level of major, minor, or warning.

External Device Alarm Admin must be enabled on the System-Parameters Customer-Options form before External Device Alarm commands can be administered. This is a right-to-use feature; only INADS can administer System-Parameters Customer-Options and the add/change/remove external-device-alarm commands. Execution of the list/display external-device-alarm commands is controlled by the Command Permission set up for each login.

### Administration commands

Use the following commands to administer the External Device Alarm form.

| Action  | Object                  | Qualifier <sup>1</sup>  |
|---------|-------------------------|-------------------------|
| add     | eda-external-device-alm | port                    |
| change  | eda-external-device-alm | port                    |
| display | eda-external-device-alm | port                    |
| list    | eda-external-device-alm | ['print' or 'schedule'] |
| remove  | eda-external-device-alm | port                    |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

**⇒ NOTE:**

Port number is the qualifier for add, change, display, and remove commands. The port number is the "port" location used for the alarm connection. Since the 'maintenance circuit pack' alarm connections connect to control carrier circuit packs that are in unnumbered slots, the standard port format cannot be used to designate these alarm connections. The special locations UUmajor and UUminor are used to designate the name of the major or minor maintenance circuit pack alarm connection for cabinet UU. This cabinet number is also assumed for cabinet 01.

**⇒ NOTE:**

The major/minor designation specifies the pair of wires, on the auxiliary connector of the Port Network, not the alarm level associated with the

connection (i.e., the “major” port can be administered as a major, minor, or warning alarm and the “minor” port can be administered as a major, minor, or warning alarm.)

Port is made up of the following information.

| Characters | Meaning        | Value                      |
|------------|----------------|----------------------------|
| 1-2        | Cabinet Number | 1 through Max <sup>1</sup> |
| EITHER     |                |                            |
| 3          | Carrier        | A through E                |
| 4-5        | Slot           | 01-20                      |
| 6-7        | Circuit Number | 01 through 16              |
| OR         |                |                            |
| 3-7        |                | ['major' or 'minor']       |

- 
1. Max is the maximum cabinet number for the system.

## Display Port Command

External device alarm is a new Equipment Type on the Display Port screen. The Alt Name, which you enter on the External Device Alarm Port form, will appear on the Display Port screen in the Identification field.

## Form instructions

---

Make assignments as required for the following fields on each page of the form:

## Page 1 of the External Device Alarm Port form

```
add external-device-alarm 03minor                                SPE A
                        EXTERNAL DEVICE ALARM PORT

                        Port: 03minor
                        Alarm Type: major
                        Alt Name: Audix 2
                        Description: Audix 2 remote equipment room

Screen 5-40. Example List Eda — External Device Alarm Ports form

- **Port** — Display only. You entered the port number on the command line.
- **Alarm Type** — Assign the alarm level for this external device alarm port. Entries are **major**, **minor** (default), or **warning**.

5 Basic Forms

*External Device Alarm*

Page 5-112

- **Alt Name** — Enter up to a 7 character adjunct short name for this external device alarm. Entries are **a** through **z**, **A** through **Z**, **0** through **9**, or a space to create the name. The name will appear in the `Alt Name` field of several related List, Display, and Test forms. Default is blank.
- **Description** — Enter up to a 40 character adjunct description for the external device alarm. Entries are **a** through **z**, **A** through **Z**, **0** through **9**, or a space to create the name. Default is blank.
- **Product Identifier** — Enter the 10 digit product identifier of the external device alarm. Leading zeroes are significant and retained. If you leave the field blank, alarms associated with the connected adjunct will use the switch product identifier administered on the Change System-Parameters Maintenance screen. Default is blank.
- **Building** — Enter up to a 40 character description of the external device alarm's building location. Entries are **a** through **z**, **A** through **Z**, **0** through **9**, or a space to create the description. Default is blank.
- **Address** — Enter up to a 40 character building address. Entries are **a** through **z**, **A** through **Z**, **0** through **9**, or a space to create the address. Default is blank.

## Feature Access Code

---

This form assigns feature access codes (FACs) that, when dialed, activate or cancel the system features.

### Administration commands

---

Use the following commands to administer the Feature Access Codes form.

| Action  | Object               | Qualifier <sup>1</sup>  |
|---------|----------------------|-------------------------|
| change  | feature-access-codes | —                       |
| display | feature-access-codes | ['print' or 'schedule'] |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

### Form instructions

---

Enter the digits required to access or activate each feature. Feature access codes must conform to your dial plan.

 **NOTE:**

Analog rotary dial sets cannot use the "\*" and "#" symbols.

Screen 5-41. Feature Access Code (FAC) form (page 1 of x)

- **Abbreviated Dialing List1 Access Code** — Used to access AD list 1. 1-4 digit number; \* and # may be used as first digit.
- **Abbreviated Dialing List2 Access Code** — Used to access AD list 2. 1-4 digit number; \* and # may be used as first digit.
- **Abbreviated Dialing List3 Access Code** — Used to access AD list 3. 1-4 digit number; \* and # may be used as first digit.
- **Abbreviated Dial - Prgm Group List Access Code** — Used to enter a group list from a voice terminal. 1-4 digit number; \* and # may be used as first digit.
- **Announcement Access Code** — Used to record announcements. 1-4 digit number; \* and # may be used as first digit.
- **Answer Back Access Code** — Used to retrieve parked calls. 1-4 digit number; \* and # may be used as first digit.
- **Auto Alternate Routing (AAR) Access Code** — Used to access AAR. 1-4 digit number; \* and # may be used as first digit.
- **Auto Route Selection (ARS) Access Code1** — Used to access ARS. 1-4 digit number; \* and # may be used as first digit.
- **(ARS) Access Code 2** — Also used to access ARS. 1-4 digit number; \* and # may be used as first digit.

- **Automatic Callback Activation** — Used to activate ACB. 1–4 digit number; \* and # may be used as first digit.
  - **Deactivation** — Used to deactivate ACB. 1-4 digit number; \* and # may be used as first digit.
- **Call Forwarding Activation Busy/DA** — Used to forward calls to an administered number if the user is busy or does not answer. 1–4 digit number; \* and # may be used as first digit.
  - **All** — Used to forward calls to an administered number for all calls. 1–4 digit number; \* and # may be used as first digit.
  - **Deactivation** — Used to deactivate call forwarding. 1–4 digit number; \* and # may be used as first digit.
- **Call Park Access Code** — Used to park an active call, which can then be retrieved from a different station using the answer back access code. 1–4 digit number; \* and # may be used as first digit.
- **Call Pickup Access Code** — Used to answer a call directed to a pickup group. 1–4 digit number; \* and # may be used as first digit.
- **CAS Remote Hold/Answer Hold-Unhold Access Code** — 1–4 digit number; \* and # may be used as first digit.
- **CDR Account Code Access Code** — Used prior to entering an account code for CDR purposes. 1–4 digit number; \* and # may be used as first digit.
- **Change Coverage** — Used to change a coverage path from a voice terminal or remote station. 1–4 digit number; \* and # may be used as first digit.
- **Data Origination Access Code** — Used to originate a data call from a voice station. 1–4 digit number; \* and # may be used as first digit.
- **Data Privacy Access Code** — Used to isolate a data call from call waiting or other interruptions. 1–4 digit number; \* and # may be used as first digit.
- **Directed Call Pickup Access Code** — Used to establish directed call pickup. 1–4 digit number; \* and # may be used as first digit.
- **Emergency Access To Attendant Access Code** — Used to gain access to the attendant in an emergency situation. Such calls alert as emergency calls. 1–4 digit number; \* and # may be used as first digit.

This field cannot be used if the `Emergency Access to Attendant` field is not enabled on the `System-Parameters Customer-Options` form.
- **Extended Call Fwd Activate Busy D/A** — Used to activate call forwarding from a voice terminal or remote location. 1–4 digit number; \* and # may be used as first digit.
- **Extended Call Fwd Activate All** — Used to activate call forwarding from a voice terminal or remote location. 1–4 digit number; \* and # may be used as first digit.

- **Extended Call Fwd Deactivation** — Used to deactivate call forwarding from a voice terminal or remote location 1–4 digit number; \* and # may be used as first digit.

**NOTE:**

Users with blank Station Security Codes cannot use the following FACs:

- Extended Call Forward All Activate
- Extended Call Forward Busy/Don't Answer Activate
- Extended Call Forward Deactivate
- Change Coverage

### Implementation notes

---

The Emergency Access to Attendant Access Code field displays when the optional Emergency Access to the Attendant field has been enabled on the System-Parameters Customer-Options form.

Call Park Access Code — Do not administer to have the same first digit as another feature access code that is longer in length.

### Page 2 of the form

| Send All Calls Activation:                      | Deactivation:    |

- **Facility Test Calls Access Code** — Used to place activate a facility test call. 1–4 digit number; \* and # may be used as first digit.

**NOTE:**

To ensure the security of your system, leave `Facility Test Calls Access Code` blank except when actually testing trunks.

- **Flash Access Code** — Used to generate trunk flash. 1-4 digit number; \* and # may be used as first digit.
- **Group Control Restrict Activation** —
- **Group Control Restrict Deactivation** —
- **Hunt Group Busy Activation/Deactivation** —
- **ISDN Access Code** — Used to place an ISDN call without using ARS, AAR, or UDP. Enter a 1- to 4-digit number; \* and # may be used as the first digit.
- **Last Number Dialed Access Code** — Used to redial the last number dialed from this station.
- **Leave Word Calling Message Retrieval Lock** — Enter the unique code to be dialed to lock the display module on voice terminals. Valid entries are a 1- to 4-character string consisting of the characters 0 through 9; \* and # may be used as the first character. (The lock function activates at a voice terminal by dialing this system-wide lock access code. This prevents unauthorized users from displaying, canceling, or deleting messages associated with the voice terminal.) The `Lock Messages` field on the Station form also must be enabled.
- **Leave Word Calling Message Retrieval Unlock** — Enter the unique code to be dialed to unlock a voice terminal's display module. Valid entries are a 1- to 4-character string consisting of the characters 0 through 9; \* and # may be used as the first character. The lock function is canceled at the voice terminal by dialing this unlock FAC followed by the SCC.
- **Leave Word Calling Send A Message** — Enter the unique code to be dialed to send a message. Valid entries are a 1- to 4-character string consisting of the characters 0 through 9; \* and # may be used as the first character.
- **Leave Word Calling Cancel A Message** — Enter the unique code to be dialed to cancel a message. Valid entries are a 1- to 4-character string consisting of the characters 0 through 9; \* and # may be used as the first character.
- **Malicious Call Trace Activation** — Used to activate a trace on a malicious call.
- **PASTE (Display PBX data on Phone) Access Code** —
- **Per Call CPN Blocking Code Access Code** — Enter 1 to 4 digit number and \* and # may be used as the first digit. Default is blank.

5 Basic Forms

Feature Access Code

- **Per Call CPN Unblocking Code Access Code**— Enter 1 to 4 digit number and \* and # may be used as the first digit. Default is blank.
- **Personal Station Access (PSA) Associate Code** — Enter the unique code the user will dial to activate the Personal Station Access feature at a terminal. Valid entries are a 1- to 4-character string consisting of the digits 0 through 9; \* and # may be used as the first character.
- **Dissociate Code** — Enter the code the user will dial to dissociate the PSA feature at a terminal. Valid entries are a 1- to 4-character string consisting of the digits 0 through 9; \* and # may be used as the first character. You cannot provide either code until `Personal Station Access (PSA)` on the System Parameters Customer-Options form is `y`.
- **Print Messages Access Code** —
- **Program Access Code** —
- **Refresh Terminal Parameters Access Code** —
- **Send All Calls Activation/Deactivation** — Used to activate or deactivate sending all calls to coverage with minimal or no alerting at the station.

Screen 5-43. Feature Access Code (FAC) form (page 3 of x)

- **Station Security Code Change Access Code** — Enter the code the user must dial to change their Station Security Code. Valid entries are a 1- to 4-character string consisting of the digits 0 through 9; \* and # may be used as the first character. The SCC must be administered before the user can change it using this FAC. That is, a user cannot change a blank SCC.
- **Terminal Dial-Up Test Access Code** —
- **Terminal Translation Initialization Merge Code** — Enter the digits that must be dialed to install (merge) a station without losing any of its previous feature settings. The Terminal Translation Initialization Separation Code must have been used, or the station made AWOH, when the voice terminal was removed from its former location in order for the Terminal Translation Initialization Merge Code to be effective.

- **Terminal Translation Initialization Separation Code** — Enter the digits that must be dialed to remove (separate) a station from a location without losing any of its feature settings.
- **Transfer to AUDIX Access Code** — Enter the digits that must be dialed to allow coverage to transfer the caller to the original call recipient's AUDIX mail where the caller can leave a message. Valid entries are a 1- to 4-digit number consisting of the digits 0 through 9; \* and # may be used as the first digit. Default is blank.
- **Trunk Answer Any Station Access Code** —
- **User Control Restrict Activation/Deactivation** —
- **Voice Coverage Message Retrieval Access Code** — Allows users to retrieve voice coverage messages via a digital display module.
- **Voice Principal Message Retrieval Access Code** —

### Implementation note

---

Transfer into AUDIX Access Code — Do not administer to have the same first digit as another feature access code that is longer in length.

    Remove Agent Skill Access Code: \_\_\_

Call Vectoring/Call Prompting Features

    Converse Data Return Code: \_\_\_

Screen 5-44. Feature Access Code (FAC) form (page 4 of x)

The next eleven fields are only available for administration if the ACD field (Automatic Call Distribution) has been enabled on the System-Parameters Customer-Options form.

 NOTE:

These fields will also display if `Vectoring (Basic)` and `Vectoring (Prompting)` have been enabled on the System-Parameters Customer-Options form; however, they will only be administrable if ACD has been enabled.

- **After Call Work Access Code** — Enter the code the agent must dial when the agent will be performing work-related ACD activities.
- **Assist Access Code** — Enter the digit the agent must dial to request assistance from the split supervisor.
- **Auto-In Access Code** — Enter the code the agent must dial to become automatically available to receive another ACD call each time a call is released.
- **Aux Work Access Code** — Enter the code the agent must dial when the agent will be performing non-ACD activities.
- **Login Access Code** — Enter the code the agent must dial to gain access to the ACD functions. This is a system-wide code for all ACD agents.
- **Logout Access Code** — Enter the logout code the agent must enter to exit ACD. This is a system-wide logout code for all ACD agents.
- **Manual-In Access Code** — Enter the code the agent must dial to receive a single, new ACD call upon the completion of an ACD call.

The following two fields appear only if `Service Observing (Remote/By FAC)` on the System Parameters Customer-Options form is **y**.

- **Service Observing Listen Only Access Code** — Enter the code that must be dialed to allow a station with Service Observing permission (COR) to listen to other agent ACD calls without being heard on the ACD call.
- **Service Observing Listen/Talk Access Code** — Enter the code that must be dialed to allow a station with Service Observing permission (COR) to both listen and be heard on an ACD call.

The following two fields appear only if `Expert Agent Selection (EAS) Enabled` is optioned on the Feature-Related System-Parameters form.

- **Add Agent Skill Access Code** — Enter the digits an agent must dial to be able to add a skill to their current skill set.
- **Remove Agent Skill Access Code** — Enter the digits an agent must dial to be able to remove a skill from their current skill set.

The next field is available only if `Vectoring (Basic)` and `Vectoring (Prompting)` have been enabled on the System-Parameters Customer-Options form.

- **Converse Data Return Code** — Enter the access code the CONVERSANT must outpulse prior to outpulsing the digits being returned to the system. This FAC must match the code administered on CONVERSANT.

## Implementation notes

---

The Call Vectoring/Call Prompting features only display if Vectoring (Basic) and Vectoring (Prompting) have been enabled on the System-Parameters Customer-Options form.

## Screen 5-45. Feature Access Code (FAC) form (page 5 of xS)

The access codes assigned to the Housekeeping Status (Client Room) Access Code and Housekeeping Status (Station) Access Code fields are assigned to reflect the customer requirements. These codes are transmitted to the Property Management System (PMS) for processing.

The next five fields display only if Hospitality (Basic) has been enabled on the System-Parameters Customer-Options form.

- **Automatic Wakeup Call Access Code** — Enter the access code the user must dial to schedule or cancel a wakeup call.
- **Housekeeping Status (Client Room) Access Code** — Enter the access code the housekeeper dials from the client's room to provide room status. There are six codes.

5 Basic Forms

Feature Access Code

Page 5-122

- **Housekeeping Status (Station) Access Code** — Enter the access code the housekeeper must dial to provide room status. This access code must be dialed from designated voice terminals. There are four codes.
- **Verify Wakeup Announcement Access Code** — Enter the access code the user can dial to verify a wakeup announcement.
- **Voice Do Not Disturb Access Code** — Enter the access code the user must dial to enter or cancel a do not disturb request without using a display — through the use of voice prompting.

Screen 5-46. Feature Access Code (FAC) form (page 5 of 5)

- **Multimedia Data Conference Access Code** — Enter the access code the user must dial to initiate a multimedia data collaboration session. This code only applies if Multimedia Call Handling is enabled.

## Feature-Related System Parameters

---

This form implements system parameters associated with various System features.

### Administration commands

---

Use the following commands to administer the Feature-Related System Parameters form.

| Action  | Object                     | Qualifier <sup>1</sup>  |
|---------|----------------------------|-------------------------|
| change  | system-parameters features | —                       |
| display | system-parameters features | ['print' or 'schedule'] |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

### Form instructions

---

Make assignments as required for the following fields on each page of the form:

Page 1 of the form

Page 1 of 8

FEATURE-RELATED SYSTEM PARAMETERS

Trunk-to-Trunk Transfer? none

Coverage Subsequent Redirection/CFWD No Answer Interval: 3\_  
 Coverage - Caller Response Interval (seconds): 4\_  
     Keep Held SBA at Coverage Point? y\_

Abbreviated Dial Programming by Assigned Lists:  
 Auto Abbreviated/Delayed Transition Interval(rings):

Screen 5-47. Feature-Related System Parameters form (page 1 of 8)

- **Trunk-to-Trunk Transfer** — Enter **all** to enable all trunk-to-trunk transfers. This allows voice terminal users to set up trunk-to-trunk transfer, go on-hook without disconnecting the call, and forward the call to a remote location. Enter **restricted** (restricted public) to restrict all public trunks (CO, WATS, FX, CPE, DID, and DIOD). Enter **none** (default) to restrict all trunks (except CAS and DCS) from being transferred.

 **NOTE:**

Regulations in some countries control the settings for this field. See your Lucent Technologies representative for assistance.

- **Coverage Subsequent Redirection/CFWD No Answer Interval** — Enter the number of times (**1** through **99**) a voice terminal in a Call Coverage path rings before the call routes to the next coverage point. A typical (recommended) interval is 2 to 3 rings. This value also is used by the Call Forward Busy/Don't Answer field to control the number of rings before the call is forwarded. Default is **3**.
- **Coverage — Caller Response Interval (seconds)** — Enter the time in seconds (**0** through **10**) the caller (internal caller only) has before the call redirects to the called party's first coverage point. The calling party can either hang up, use Leave Word Calling, or press the Go to Cover button during this time interval. Default is **4**.

- **Keep Held SBA at Coverage Point** — Enter **y** (default) to keep a simulated bridged appearance on hold at the coverage point when the principal enters the call; otherwise, enter **n**. If the bridged appearance is kept, the covering user then may enter the call along with the principal and the calling party.
- **Automatic Callback — No Answer Timeout Interval (rings)** — Enter the number of times the callback call rings at the calling station before the callback call is canceled. Valid entries are **2** through **9**. Default is **4**.
- **Call Park Timeout Interval (minutes)** — Enter the number of minutes (**1** through **90**) a call remains parked before it cancels. Default is **10**.
- **Off-Premises Tone Detect Timeout Interval (seconds)** — Enter the number of seconds (**5** through **25**) a call progress tone receiver (CPTTR) tries to detect dial tone from a trunk during dialing. Once the time-out interval occurs, the call either outpulses on the trunk or gets intercept treatment depending on the setting of the `Outpulse Without Tone` field on page 6 of this form. The default is **20**.
- **AAR/ARS Dial Tone Required** — Enter **y** (default) to indicate a second dial tone is to be given to the calling party on a incoming tie or DID trunk call that is to be routed via AAR/ARS. A second dial tone provides feedback to the user that additional dialing can occur.
- **Music/Tone on Hold** — Enter **music** or **tone** to indicate what a caller hears while on hold; enter **none** (default) for silence. This field does not appear if `Tenant Partitioning` is **y** on the System-Parameters Customer-Options form.

 **NOTE:**

If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from, or pay fees to, a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI). You can purchase a Magic OnHold<sup>®</sup> system, which does not require such a license, from Lucent Technologies.

- **Port** — Appears when `Music/Tone on Hold` is **music**. Indicates the port number that provides Music-on-Hold access. This requires a port on a TN763 Auxiliary Trunk circuit pack or any supported Analog Line circuit pack. The entry breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 22 |
|            |                | 01 through 03 |
| 3          | Carrier        | A through E   |

| Characters | Meaning        | Value                          |
|------------|----------------|--------------------------------|
| 4-5        | Slot Number    | 01 through 20                  |
| 6-7        | Circuit Number | 01 through 04 (Aux Trunk Port) |
|            |                | 01 through 16 (Analog Port)    |

- **Music (or Silence) On Transferred Trunk Calls** — Enter **all** to allow all transferred trunk calls to receive music until the call is answered if the Music-on-Hold feature is available. Enter **n** (default) if trunk callers are to hear music (or silence if Music-on-Hold is not administered) while waiting to be transferred, and then ringback as soon as the transfer is completed till the call is answered. Enter **call-wait** if trunk calls transferred to stations that require the call to wait hear music (if administered); all other transferred trunk calls receive ringback tone.
- **DID/Tie/ISDN Intercept Treatment** — Enter a recorded announcement extension number or **attd** (default) for the attendant to be used for intercept of invalid Direct Inward Dialing and/or tie trunk calls.

 **NOTE:**

For system security, Lucent recommends entering "**attd**" in this field. This routes intercept calls to the attendant and, if the attendant receives several of these, they will know a problem exists.

- **Messaging Service Adjunct (MSA) Connected** — Enter **y** if AUDIX Voice Power MSA is connected to the system. Default is **n**.
- **Internal Automatic Answer for Attendant Extended Calls** — Enter "y" to enable IAA for attendant extended calls. This only applies to the 7313H through 7317H (MERLIN) voice terminals as well as speaker equipped 73XX-series (ATL) hybrid voice terminals and digital voice terminals (except BRI) with a headphone or speaker capability. Default is **n**.
- **Automatic Circuit Assurance (ACA) Enabled** — Must have an "aca-halt" button administered on the user's station. Enter **y** if ACA measurements will be taken; otherwise, enter **n** (default). If you enable this feature, complete the following ACA-related fields.
- **ACA Referral Calls** — (Only displays when ACA Enabled is **y**.) Enter **local** (default), **primary**, or **remote** to indicate where ACA referral calls generate. Local referral calls generate on and for the local switch. Primary referral calls generate on the local switch for remote switches as well as the local switch. Remote referral calls generate at another switch in a DCS network. In this case, the remote node number must also be entered. The remote node number is the same node number as defined on the Dial Plan form. Also, ACA button status transmits to other switches when in a DCS network.

- **ACA Referral Destination** — Enter the extension on the local switch that is to receive the ACA referral call or enter **attd** for attendant. The specified extension should be equipped with a display module. This field only displays if `ACA Referral Calls` is **local** or **primary**.
- **ACA Short Holding Time Originating Extension and ACA Long Holding Time Originating Extension** — Enter an unassigned extension number in each field. Do not use the same extension number for both fields. The specified extensions are assigned automatically by the system when the form is submitted. These fields only display if `ACA Referral Calls` is **local** or **primary**.
- **ACA Remote PBX Identification** — Enter a number from **1** through **63** to identify the switch in a DCS network that makes the referral call. This field only displays if `ACA Referral Calls` is **remote**. Do not define the remote PBX identified in this field as **local** on the system's Dial Plan form.
- **Auto Abbreviated/Delayed Interval (rings)** — Enter the number of rings (**1-16**) before an automatic abbreviated delayed transition is triggered for a call.
- **Abbreviated Dial Programming by Assigned Lists** — Enter **y** to allow programming by station's assigned list. Enter **n** (default) if using Program Access code to indicate which personal list to be programmed.

## Implementation notes

---

If `Automatic Circuit Assurance (ACA) Enabled` is **n**, associated ACA fields will not display.

```

Screen 5-48. Feature-Related System Parameters form (page 2 of 8)

- **Maximum Number of Messages Per Station (when MSA not in service)** — Enter the maximum number of LWC Messages that can be stored by the system for a voice terminal at a given time. Default is **10**.
- **Stations With System-wide Retrieval Permission (enter extension)** — Enter up to 10 voice terminal extension numbers that can retrieve LWC Messages for all other voice terminals. A VDN extension is not allowed. An entry of **attd** gives retrieval permission to all attendants.
- **Terminal Translation Initialization (TTI) Enabled** — Terminal Translation Initialization (TTI) must be enabled on the System-Parameters Customer-Options form before the TTI fields can be administered. Enter **y** to start a background maintenance task to generate TTI port translations for unadministered ports on TTI-supported circuit packs. Enter **n** to remove existing TTI port translations and make sure no new TTI port translations will be generated.

 **CAUTION:**

*Changing the TTI Enable field from **n** to **y** or from **y** to **n** triggers a background maintenance task that either generates (when changed to **y**) or removes (when changed to **n**) TTI port translation for unadministered ports in the system.*

- **TTI State** — Enter **data**, **resume**, **suspend**, or **voice** (default). The value of this field determines what type of TTI default port translation is generated for unadministered digital ports. Entering **suspend** allows any current generation or removal of TTI port translations to be halted and access to TTI will also be denied. Entering **resume** allows the TTI state to return to what it was before TTI was manually suspended. Enter **voice** for the Personal Station Access feature. This field displays only when Terminal Translation Initialization (TTI) Enabled is **y**.
- **TTI Security Code** — The TTI security code is a 1- to 7-digit code that TTI users must enter when accessing TTI from their terminals. (It is also known as the TTI authorization code but is not the same as system authorization codes.) This field displays only when Terminal Translation Initialization (TTI) Enabled is **y**.
- **Record PSA/TTI Transactions in History Log** — If **y** (default), TTI and PSA transactions record in the history log. You access these transactions via the List History command. This field appears only if Terminal Translation Initialization (TTI) Enabled is **y**.
- **Prohibit Bridging Onto Calls with Data Privacy** — Enter **y** to protect calls from bridge-on by any party, including Service Observing, Intrusion, Verify, and Bridging. Default is **n**.
- **Enhanced Abbreviated Dial Length (3 or 4)** — A value of **3** (default) makes 1000 Enhanced List entries available to the administrator; a value of **4** makes 10,000 entries available. The administrator may not be able to use all entry slots because of system capacity constraints.
- **Call Forward Override** — This field controls Call Forward Override with the Call Forwarding — All Calls feature. Set to **y** to allow the user of the forwarded-to station to override Call Forward — All Calls. This allows the user to initiate or transfer a call to the forwarded-from station.
- **External Coverage Treatment for Transferred Incoming Calls** — If set to **y**, then transferred calls have 2 rings (external) when they go to coverage. If set to **n**, the calls have 1 ring (internal) when they go to coverage.
- **Coverage of Calls Redirected Off-Net Enabled** — Set to **y** to allow further processing of calls redirected off-net by call forwarding or call coverage features. Set Coverage of Calls Redirected Off-Net on the System Parameters Customer-Options form to **y** to administer this field. Default is **n**.
- **Default Multimedia Outgoing Trunk Parameter Selection** — Sets default parameter for bandwidth and bearer for all video calls. Valid entries are **1x56**, **2x56**, **1x64**, and **2x64** (default).

Display Authorization Code? y

### Screen 5-49. Feature-Related System Parameters form (page 3 of 8)

- **Reserved Slots for Attendant Priority Queue** — Enter the number of calls that can go in to the emergency queue. Default is **5**.
- **Time Before Off-Hook Alert** — Enter the time in seconds that a voice terminal with an Off-Hook Alert Class of Service can remain off-hook (after intercept tone has started) before an emergency call is sent to the attendant. Valid entries are 1 to 3000 seconds. Default is **10**.
- **Emergency Access Redirection Extension** — Enter the assigned extension number (can be a VDN) where emergency queue overflow will redirect.
- **Number of Emergency Calls Allowed in Attendant Queue** — Enter the number of calls allowed in the attendant queue before additional calls are routed to the backup extension.
- **Call Pickup Alerting** — Entering **y** enables the Call Pickup Alerting feature on a system-wide basis. This provides pickup group members with a visual indication on the Call Pickup status lamp of calls eligible to be answered via Call Pickup. Default is **n**.
- **Temporary Bridged Appearance on Call Pickup** — Enter **y** (default) to allow a temporary bridged appearance for calls answered with the Call Pickup or Directed Call Pickup features. This field controls this capability on a system-wide basis. Enter **n** to prevent the temporary bridged appearance of calls answered with these features.

- **Call Pickup on Intercom Calls** — Enter **y** (default) to allow a user's or Agent LoginID's call, ringing as an intercom call, to be picked up using the `Call Pickup` or `Directed Call Pickup` features. This field controls the use of this feature throughout the system. Enter **n** to prevent the use of these features to pickup an intercom call.
- **Directed Call Pickup** — Enter **y** to allow use of the `Directed Call Pickup` feature across the system. Enter **n** (default) to prevent feature use. Feature use by individual stations, attendants, or EAS agents can be controlled by COR.
- **Deluxe Paging and Call Park Timeout to Originator** — Enter **y** to enable the `Loudspeaker Paging - Deluxe` feature that essentially integrates the `Loudspeaker Paging` and `Call Park` features. All parked calls that time out (not answered by paged party) return to the parking party. Enter **n** (default) to enable the `Loudspeaker Paging` feature. Paged calls that are to be parked require separate activation of the `Call Park` feature. All parked calls that time out return to the attendant.
- **Controlled Outward Restriction Intercept Treatment** — Enter the type of intercept treatment the caller receives when the call is outward restricted. Valid entries are **announcement**, **attendant**, **coverage**, **extension** (may not be a VDN extension), or **tone** (default). If **announcement** or **extension** is entered, enter the extension number for the announcement or extension in an associated field.
- **Controlled Termination Restriction (Do Not Disturb)** — Enter the type of intercept treatment the caller receives when the call is placed to a termination restricted voice terminal. Valid entries are **announcement**, **attendant**, **cover**, **extension** (may not be a VDN extension), or **tone** (default). If **announcement** or **extension** is entered, complete an associated extension number field.
- **Controlled Station-to-Station Restriction** — Enter the type of intercept treatment the caller receives when the call is placed to a restricted voice terminal. Valid entries are **announcement**, **attendant**, **extension** (may not be a VDN extension), or **tone** (default). If announcement or extension is entered, an associated extension number field displays. Enter the extension of the restricted voice terminal in the field.
- **Authorization Codes Enabled** — Enter **y** to enable the `Authorization Codes` feature on a systemwide basis. This field cannot be administered if `Authorization Codes` is not enabled on the `System-Parameters Customer-Options` form. Default is **n**.

**NOTE:**

To maintain system security, Lucent recommends that `Authorization Codes` be used.

- **Authorization Code Length** — Enter a number from **4** through **7** (default) that defines the number of digits (length) in the `Authorization Code` field. This field only displays and must be completed if `Authorization Codes Enabled` is **y**. This is the number of digits that must be assigned to the `Authorization Code (AC)` field on the `Authorization Code` form.

**NOTE:**

You enhance your system's security by using the maximum length for your authorization code.

- **Authorization Code Cancellation Symbol** — Enter the symbol a caller must dial to cancel the 10-second wait period during which the user can enter an authorization code. Enter the cancellation code **#** (default) if the main and tandem switches are both the same type of switch. Enter the cancellation code **1** if an Lucent Technologies System 85 or DIMENSION PBX switch is part of the complex/network. This field only displays when `Authorization Code` is **y**.
- **Attendant Time Out Flag** — Enter **y** if a call is to be routed to the attendant if the caller does not dial an authorization code within 10 seconds or dials an invalid authorization code. If this field is not enabled, the caller receives Intercept tone. This flag affects only remote users or incoming calls over trunks requiring an authorization code. This field only displays if `Authorization Codes Enabled` is **y**. Default is **n**.
- **Display Authorization Code** — Enter "**y**" to allow authorization code digits to display on the set during the dialing. Enter "**n**" if these digits should not display. This field applies only to DCP, not to BRI or hybrid sets.

**NOTE:**

To enhance your system's security, `Display Authorization Code` should be set to **n**.

System Printer Parameters (printer dedicated to support the Report Scheduler feature):

- **System Printer Extension** — Enter either the data module extension number associated with the System printer or enter **eia** if the DCE jack is used to interface the printer.

**NOTE:**

The **eia** option is not available for R5r and later configurations.

- **Lines Per Page** — Enter the number of lines per page required for the report. Valid entries are **24** through **132**. Default is **60**.
- **EIA Device Bit Rate** — This field is not displayed for R5r and later configurations. Enter **1200**, **2400**, **4800**, or **9600** (default) per the required printer speed setting.

System-Wide Parameters:

- **Switch Name** — Enter the name of the switch.

Malicious Call Trace Parameters:

- **Apply MCT Warning Tone** — Enter **y** to provide an audible tone to the controlling station when an MCT recorder is actively recording a malicious call. Default is **n**.
- **MCT Voice Recorder Trunk Group** — Assign the trunk group for MCT voice recorders. Default is blank.

Send All Calls Options:

- **Send All Calls Applies to** — If set to **station** (default), any call to that station, regardless of the number dialed, causes calls to that station's own extension to be sent immediately to Coverage, or causes calls to different extensions assigned to the station as bridged appearances to become Ring-Ping notification if `Redirect Notification` field is **y**. When set to **extension**, only the calls sent to that extension are placed to coverage.
- **Auto Inspect on Send All Calls** — If set to **n** (default), you are not guaranteed a Calling Party display for calls sent directly to Coverage by the Send-All-Calls feature. If set to **y**, allows you to be presented automatically with Calling Party information for calls which are silently alerting their station because of the Send-All-Calls feature.

Universal Call ID (UCID):

- **Create Universal Call ID (UCID)** — If set to **n** (default), the DEFINITY will not generate a UCID for any call. If set to **y**, DEFINITY will generate UCID for each call when necessary.
- **UCID Network Node ID** — Enter a number unique to the switch in a network of switches. This number is an important part of the UCID tag and must be unique to the switch. Valid entries are a number between **1 - 32767** or blank.

DTMF Tone Feedback Signal to VRU - Connection: _ Disconnection: _
    
```

Screen 5-51. Feature-Related System Parameters form (page 5 of 8)

- **Public Network Trunks on Conference Call** — Enter **0** to **5** (default) to indicate the number of public network trunks allowed on a conference call. If this field is **0**, the `Conference Parties with Public Network Trunks` field will not appear on the form.
- **Conference Parties with Public Network Trunks** — Enter a number between **3** and **6** (default) to specify the maximum number of parties allowed in a conference call involving a public network subscriber. If the value of the `Public Network Trunks on Conference Call` field is **0**, this field will not appear on the form.
- **Conference Parties without Public Network Trunks** — Enter a number between **3** and **6** (default) to specify the maximum number of parties allowed in a conference call involving no public network trunks.
- **Night Service Disconnect Timer (seconds)** — Enter a number between **10** and **1024** or blank to indicate how long a trunk call can be unanswered during night service before being disconnected. The trunk must not have `Disconnect Supervision` for this timer to apply. Default is **180**.
- **Short Interdigit Timer (seconds)** — Enter a number between **3** (default) and **9** to limit the time that digit analysis will wait for the next digit when it has predicted that all the digits have already been collected.
- **Unanswered DID Call Timer (seconds)** — Enter number between **10** and **1024** or blank (default) to limit how long a DID call can remain unanswered before routing to the `DID/TIE/ISDN Intercept Treatment` feature. A value of blank disables this timer. This timer interacts with the nonadministrable 50 second `Wait for Answer Supervision Timer (WAST)`. The `WAST` timer overrides this field. Thus if this field is set to a value equal to or greater than 50 seconds, the caller receives intercept tone instead of the normal attendant or announcement treatment that is given when the `Unanswered DID Call Timer` expires before the `WAST`. If the `Unanswered DID Call Timer` expires while the DID call is being processed by call vectoring, the timer is ignored. See “`Wait Answer Supervision Timer`” in this section.
- **Line Intercept Tone Timer (seconds)** — Enter a number between **2** and **60** to specify how long an analog station user can wait after hearing warning tone without going on hook, before the station is placed in the lockout state. Default is **30**.
- **Auto Start** — Enter **y** to enable the Automatic Start feature. If this field is enabled, the `Start` buttons on all attendant consoles are disabled. Default is **n**.
- **Auto Hold** — Enter **y** to enable the Automatic Hold feature on a systemwide basis. Default is **n**.
- **Attendant Tone** — Enter **y** (default) to provide call progress tones to the attendants.
- **Bridging Tone** — Enter **y** to apply a bridging tone when calls are bridged on primary extensions. Default is **n**.

- **Conference Tone** — Enter **y** to provide conference tone as long as three or more calls are in a conference call. Default is **n**.

 **NOTE:**

Bridging and Conference Tones are not supported by all countries. If these tones are enabled for countries other than Italy, Belgium, United Kingdom, or Australia, the tones will be equivalent to no tone (silence) unless the tone is independently administered or customized on the System-Parameters Country Options form.

- **Intrusion Tone** — Enter **y** to apply an intrusion tone (executive override) when an attendant intrudes on the call. Default is **n**.
- **DID Busy Treatment** — Enter **attendant** or **tone** (default) to specify how to handle a DID call to a busy station.
- **Allow AAR/ARS Access from DID/DIOD** — Enter **y** to allow calls for DID and DIOD type trunk groups to complete calls using ARS or AAR. Default is **n**.

The next four fields control the Distinctive Audible Alerting feature. This feature provides an administrable ringing pattern (1-, 2-, or 3-bursts) for internal, external, and priority calls. An internal call is a station to station call, or a call over a tie trunk administered as "internal." An external call is from a trunk other than a tie trunk administered as "internal." A priority call is one so designated by the calling party. Only sets with correct permissions can make priority calls.

- **Internal** — Enter a number (1 through 3) to specify the ringing pattern for internal calls. Default is 1.
- **External** — Enter a number (1 through 3) to specify the ringing pattern for external calls. Default is 2.
- **Priority** — Enter a number (1 through 3) to specify the ringing pattern for priority calls. Default is 3.
- **Attendant Originating Calls** — Enter **internal**, **external** (default), or **priority** to indicate which type of ringing (defined above) to apply to attendant originated calls.
- **DTMF Tone Feedback Signal to VRU - Connection** — Enter the type of DTMF tone feedback signals to be provided to the VRU. Valid entries are the numbers 0 through 9, the characters \*, #, A, B, C, D, or blank. Blank means that no tone is to be sent to the VRU. This field appears only if DTMF Feedback Signals for VRU on the Customer-Options System Parameters form is **y**.
- **DTMF Tone Feedback Signal to VRU - Disconnection** — Enter the type of DTMF tone feedback signals to be provided to the VRU. Valid entries are the numbers 0 through 9, the characters \*, #, A, B, C, D, or blank. Blank means that no tone is to be sent to the VRU. This field appears only if DTMF Feedback Signals for VRU on the Customer-Options System Parameters form is **y**.

Screen 5-52. Feature-Related System Parameters form (page 6 of 8)

- **Pull Transfer** — Enter **y** to enable the Pull Transfer feature on a systemwide basis. Default is **n**.
- **Update Transferred Ring Pattern** — Enter **y** to change the ringing pattern from internal to external when an internal station transfers an external call.
- **Outpulse Without Tone** — Enter **y** (default) to indicate the switch will outpulse digits even when a dial tone has not been received. Enter “**n**” if the calling party should receive intercept tone if no dial tone is detected.
- **Wait Answer Supervision Timer** — Enter **y** to enable this feature on a systemwide basis. When **y** is entered in this field, calls to stations unanswered after 50 seconds are dropped. When **n** (default) is entered in this field, unanswered calls drop only when the calling party goes on-hook. See “Unanswered DID Call Timer” on [5-135](#).
- **Misoperation Alerting** — Enter **n** for standard misoperation handling without recall alerting. Enter **y** for misoperation recall alerting on multi-appearance stations, analog stations, and attendant consoles. Misoperation Alerting should not be enabled if Call Prompting is optioned.
- **Repetitive Call Waiting Tone** — Enter **y** to indicate a repetitive call waiting tone is provided to the called party for all forms of call waiting access. Default is **n**.

5 Basic Forms

Feature-Related System Parameters

Page 5-138

- **Allow Conference via Flash** — Enter **y** (default) to allow an analog station to use flash to conference calls together. Enter **n** to prevent this.
- **Repetitive Call Waiting Interval (sec)** (This field appears when the Repetitive Call Waiting Tone is **y**.) — Enter a number from **1** to **99** in increments of 1 to specify the number of seconds between call waiting tones.
- **Vector Disconnect Timer (min)** — Enter the number of minutes, between **1** and **240**, that a trunk should remain connected to a vector. The number of minutes that you enter determines when the trunk will be disconnected if the `Disconnect Supervision-In` or `Disconnect Supervision-Out` fields on the Trunk form are **n**. Enter blank if you do not want DEFINITY ECS to initiate a disconnect.
- **Network Feedback During Tone Detection** — Enter **y** (default) to provide audible feedback to the user while the system attempts to detect dial tone.
- **Hear Zip Tone Following VOA?** — Enter **y** to play zip tone following a VDN of Origin Announcement (VOA). This tone alerts a voice terminal user that the announcement has completed and a caller is now connected. CallMaster voice terminal and attendant console users hear double zip tone following the announcement. All other voice terminal users hear single zip tone. Enter **n** if you do not want zip tone following a VOA. Note this field does not effect auto-answer zip tone heard prior to the VOA.
- **System Updates Time On Station Displays** — Enter **y** to have the system automatically update the time on display terminals when background maintenance is run (for example, when the set is plugged in). This does not apply to terminals (such as BRI voice terminals) where the user sets the time.
- **Intercept Treatment on Failed Trunk Transfers** — Enter **y** to provide intercept treatment to calls failing trunk transfers. This provides misoperation handling for such calls. Enter **n** (default) to drop these calls.
- **Station Tone Forward Disconnect** — Enter **busy**, **intercept** or **silence** (default). When a station is the last party remaining off-hook on a call, that station receives the indicated tone or silence until that station is placed on-hook, or until the tone has played for 45 seconds and is followed by silence. The Tone Forward Disconnect applies to any station other than one administered as a data endpoint, an attendant console, a BRI terminal, an auto answer, or as an Outgoing Call Management (OCM) agent.
- **Level of Tone Detection** — Enter **broadband**, **medium**, or **precise** (default) to specify the precision level of tone detection to be supported in the switch.

- **Charge Display Update Frequency (seconds)** — The amount of time (in seconds) between charge-display updates. Valid values are **10–60**; default is **30**. This applies only if you use Advice of Charge or Periodic Pulse Metering with display functions. Frequent display updates may have considerable performance impact.
- **Date Format on 6400/8400 Terminals** — The format of the date as displayed on the terminals. Default is mm/dd/yy; the other options are dd/mm/yy and yy/mm/dd.
- **On-hook Dialing on 6400/8400 Terminals** — For 6400/8400 terminals users with speakerphones, allows you to use keypad dialing without first going off-hook. Enter **y** to perform Abbreviated Dialing while “on-hook.” Default is **n**.

The next four fields control station-to-switch recall signal timing. If a flashhook interval (recall window) is required, the upper and lower bounds of the interval can be administered. An on-hook that lasts for a period of time greater than or equal to the lower bound and less than or equal to the upper bound will be treated as a recall flash. If an interval is not required, the Disconnect Timing value must be administered. An on-hook that lasts for a period of time less than this value will be ignored; greater than or equal to this value will be regarded as a disconnect. Regardless, an on-hook lasting 50 to 150 ms coming from a 2500-type set will always be treated as a digit pulse unless Ignore Rotary Digits is **y** for that station.

- **Flashhook Interval** — Enter **y** to indicate that a flashhook interval (recall window) is required. If a **y** (default) is entered, `Upper Bound` and `Lower Bound` appear; if **n** is entered, `Disconnect Timing` appears.
- **Upper Bound (msec)** — Appears when `Flashhook Interval` is **y**. Specifies the upper bound of the station-to-switch recall signal timing interval in milliseconds. Enter **150** through **1250** (in increments of 10) to specify the upper bound of the flashhook interval. Default is **1000**.
- **Lower Bound (msec)** — Appears when `Flashhook Interval` is **y**. Specifies the lower bound of the station-to-switch recall signal timing interval in milliseconds. Enter **150** through **1250** (in increments of 10) to specify the lower bound of the flashhook interval. Default is **200**.
- **Forward Disconnect Timer (msec)** — Specify the duration of a momentary disconnect sent by the PBX to an analog station user when that user is the last party still off-hook on a call.

The next three fields control the Enhanced DCS feature.

- **Enhanced DCS Enabled?** — Enter **y** to enable the Enhanced DCS feature on a systemwide basis. Default is **n**.
- **Apply Intercept Locally?** — Enter **y** (default) to indicate that DID/CO intercept treatment will be applied locally instead of on the originating switch. This field appears only if `Enhanced DCS Enabled` is **y**.
- **Enforce PNT-to-PNT Restrictions?** — Enter **y** to indicate that restrictions and denial of PNT-to-PNT connections will be enforced when the EDCS message is unavailable. A **y** in this field means restrictions will be enforced. This field appears only if `Enhanced DCS Enabled` is **y**. Default is **n**.

## Implementation notes

---

A flash of 50 msec to 130 msec is always acceptable from a 2500-type set regardless of the setting of the Upper and Lower bounds and will be treated as the digit one.

### NOTE:

This version of page 6 displays *only* if G3 Version is **v5** or greater on the System Parameters Customer Options form.

5 Basic Forms

Feature-Related System Parameters

- **Send Non-ISDN Trunk Group Name as Connected Name** — Enter **y** to send a name of the non-ISDN trunk group as the connected name when a call routes from ISDN to non-ISDN and the call is answered. Default is **n**.
- **Display Connected Name/Number for ISDN DCS Calls** — Enter **y** to display the connected name/number (if received) for ISDN DCS calls. Default is **n**.
- **Send ISDN Trunk Group Name on Tandem Calls** — Enter **y** to provide consistent display information regardless of trunk type. If set to **y**, provides only trunk group name. Default is **n**.
- **QSIG TSC Extension** — Displays only if G3 Version is **v6** or greater on the System Parameters Customer Options form. This is the phantom endpoint extension for QSIG Temporary Signaling Connections (TSCs) (both incoming and outgoing). Enter any valid, unassigned extension. Default is blank.
- **Path Replacement with Measurements** — Displays only if G3 Version is **v6** or greater on the System Parameters Customer Options form. Allows QSIG path replacement or DCS with Reroute to be attempted on measured calls. Default is **y**.

SERVICE OBSERVING

Service Observing Warning Tone? n

ASAI

Call Classification After Answer Supervision? n                      Send UCID to ASAI? n

Screen 5-54. Feature-Related System Parameters form (page 7 of 8)

## Call Center System Parameters:

- **Expert Agent Selection (EAS) Enabled** — Only displays if `Expert Agent Selection (EAS)` on the System-Parameters Customer-Options form is **y**. Enter **y** to enable Expert Agent Selection. To enable this field, either no ACD or vectoring hunt groups may exist or, existing ACD or vectoring hunt groups must be "skilled." Default is **n**.
- **Minimum Agent-LoginID Password Length** — Only displays if `Expert Agent Selection (EAS)` on the System-Parameters Customer-Options form is **y**. Enter the minimum number of digits that must be administered as an EAS Agent's LoginID password. Valid entries are **0** through **9** or blank. Entering a **0** or blank indicates no password is required. Default is blank.
- **Direct Agent Announcement Extension** — Only displays if `Expert Agent Selection (EAS)` or `ASAI` on the System-Parameters Customer-Options form is **y**. Enter a valid announcement extension (consistent with the dial plan).
- **Direct Agent Announcement Delay** — Only displays if `Expert Agent Selection (EAS)` or `ASAI` on the System-Parameters Customer-Options form is **y**. Enter the number of seconds (**0** to **99**) the caller will hear ringback before the Direct Agent Announcement is heard by the calling party.
- **Message Waiting Lamp Indicates Status For** — Only displays if `Expert Agent Selection (EAS)` on the System-Parameters Customer-Options form is **y**. If `Expert Agent Selection (EAS) Enabled` is **y**, you can enter either **station** or **loginID**, otherwise you can only enter **station**.
- **Converse First Data Delay/Second Data Delay** — Only displays if `Vectoring (Basic)` on the System-Parameters Customer-Options form is **y**. The `First Data Delay` prevents data from being outpulsed (as a result of a converse vector step) from the system to CONVERSANT before CONVERSANT is ready. The delay commences when the CONVERSANT port answers the call. Enter the number of seconds (**0** to **9**) for the delay. Default is **0**. The `Second Data Delay` is used when two groups of digits are being outpulsed (as a result of a converse vector step) from the system to CONVERSANT. The `Second Data Delay` prevents the second set from being outpulsed before CONVERSANT is ready. The delay commences when the first group of digits has been outpulsed. Enter the number of seconds (**0** to **9**) for the delay. Default is **2**.
- **Converse Signaling Tone/Pause** — Only displays if `Vectoring (Basic)` and `DTMF` on the System-Parameters Customer-Options form are **y**. In the `Signaling Tone` field, enter the length in milliseconds of the digit tone for digits being passed to the CONVERSANT. In the `Pause` field, enter the length in milliseconds of the delay between digits being passed. The optimum timers for the CONVERSANT are a 100 msec tone and 70 msec pause.

Values entered in the `Tone/Pause` fields are rounded up or down depending upon the type of circuit pack used to output the digits.

- **TN742B or later suffix analog board** — Tone and pause round up or down to the nearest 25 msec. For example a 130 msec tone rounds down to 125 msec, a 70 msec pause rounds up to 75 msec for a total of 200 msec per tone.
- **TN464F, TN767E or later suffix DS1 boards** — Tone and pause round up to the nearest 20 msec. For example a 130 msec tone rounds up to 140 msec, a 70 msec pause rounds up to 80 msec for a total of 220 msec per tone.

If a circuit pack has been used for end-to-end signalling to the `CONVERSANT`, and has then been used to send digits to a different destination, the `CONVERSANT` timers may stay in effect. To reset your timers to the system default, pull and reseal the circuit pack.

- **Prompting Timeout (secs)** — Only displays if `Vectoring (Prompting)` on the System-Parameters Customer-Options form is **y**. Enter the number of seconds, from **4** to **10** (default), before the Collect Digits command times out for callers using rotary dialing.
- **Interflow-qpos EWT Threshold** — Part of enhanced Look-Ahead Interflow. Any calls predicted to be answered before this threshold will not be interflowed (therefore saving CPU resources). Enter the number of seconds for this threshold. The default is 2 seconds.
- **Service Observing Warning Tone** — `Service Observing (Basic)` on the System-Parameters Customer-Options form must be **y** before this field may be administered. Enter **y** to assign a warning tone to be given to voice terminal users and calling parties whenever their calls are being monitored using the Service Observing feature. Default is **n**.

 **NOTE:**

The use of Service Observing features may be subject to federal, state, or local laws, rules or regulations or require the consent of one or both of the parties to the conversation. Customers should familiarize themselves and comply with all applicable laws, rules, and regulations before using these features.

- **Call Classification After Answer Supervision?** — For use with ASAI Outbound Call Management (OCM). Enter **y** to force the switch to rely on the network to provide answer/busy/drop classification to the switch. After the call has been answered, a call classifier can be added to perform answering machine, modem and voice answering detection. Enter **n** for standard operation.
- **Send UCID to ASAI** — Valid entries are **n** or **y**. Enter **y** to enable transmission of Universal Call ID (UCID) information to ASAI. Enter **n** (default) to prevent transmission of UCID information to ASAI.

- ACD Login Identification Length: 0
- BCMS/VuStats Measurement Interval: hour
- BCMS/VuStats Abandon Call Timer (seconds):
- Validate BCMS/VuStats Login IDs? n
- Clear VuStats Shift Data: on-login

### Screen 5-55. Feature-Related System Parameters form (page 8 of 8)

#### Agent and Call Selection Parameters:

- **MIA Across Splits or Skills?** — Enter **y** to remove an agent from the MIA queue for all the splits/skills/hunt groups that he or she is available in when the agent answers a call from any of his or her splits/skills/hunt groups. The default is **n**.
- **ACW Agents Considered Idle?** — Enter **y** (default) to have agents who are in After Call Work included in the Most-Idle Agent queue. Enter **n** to exclude ACW agents from the queue.
- **Call Selection Measurement** — Valid entries are **current-wait-time** (default) and **predicted-wait-time**. This field determines how DEFINITY ECS selects a call for an agent when the agent becomes available and there are calls in queue. Current Wait Time selects the oldest call waiting for any of the agent's skills. Predicted Wait Time is a feature of CentreVu<sup>®</sup> Advocate. For more information on CentreVu<sup>®</sup> Advocate, please contact your Account Executive.

#### Reason Codes Parameters:

- **Aux Work Reason Code Type** — Enter **none** if you do not want an agent to enter a Reason Code when entering AUX work. Enter **requested** if you want an agent to enter a Reason Code when entering AUX mode but do not want to force the agent to do so. Enter **forced** to force an agent to enter a Reason Code when entering AUX mode. To enter **requested** or **forced**, the Reason Codes and EAS on the System-Parameters Customer-Option form must be **y**.

5 Basic Forms

Feature-Related System Parameters

Page 5-145

- **Logout Reason Code Type** — Enter **none** if you do not want an agent to enter a Reason Code when logging out. Enter **requested** if you want an agent to enter a Reason Code when logging out but do not want to force the agent to do so. Enter **forced** to force an agent to enter a Reason Code when logging out. Enter **forced** to force an agent to enter a Reason Code when entering AUX mode. To enter **requested** or **forced**, the `Reason Codes` and `EAS` on the System-Parameters Customer-Option form must be **y**.

Call Management System Parameters:

- **Adjunct CMS Release** — Specifies the release of the CMS adjunct used with the system. For CMS, this field cannot be blank. Default is blank.
- **ACD Login Identification Length** — Enter the number of digits (**0** through **9**) for an ACD Agent Login ID if `Expert Agent Selection (EAS)` on the System-Parameters Customer-Options form is **n**. Default is **0**. If `BCMS/VuStats Login IDs` is **y**, the ACD Login ID length must be greater than 0. This field identifies an ACD agent to CMS. The number you enter in this field must equal the number of characters in the agent's login ID. For CMS, this field cannot be 0.
- **BCMS/VuStats Measurement Interval** — You can enter **half-hour** or **hour** (default) for polling and reporting measurement data if the `BCMS (Basic)` and/or the `VuStats` on the System-Parameters Customer-Options form is **y**. If neither of these features is optioned, and if you enter a value in the `BCMS Measurement Interval` field, the system displays the following error message:

**<value> cannot be used; assign either BCMS or VuStats first**

If you receive this message, see your Lucent Technologies representative to turn on `BCMS (Basic)` and/or `VuStats` on the System-Parameters Customer-Options form.

There are a maximum of 25 time slots available for measurement intervals. If **hour** is specified, an entire day of traffic information will be available for history reports; otherwise, only half a day will be available. This does not affect daily summaries as they always reflect traffic information for the entire day. The interval may be changed at any time, but will not go into effect until the current interval completes.

- **BCMS/VuStats Abandon Call Timer (seconds)** — Enter **none** or **1–10** to specify the number of seconds for calls to be considered abandoned. Calls with talk time that is less than this number (and that are not held) are tracked by BCMS and displayed by VuStats as ABAND calls.
- **Validate BCMS/VuStats Login IDs** — Enter **n** to allow entry of any ACD login of the proper length. Enter **y** to allow entry only of login-IDs that have been entered on the BCMS Login-ID form.
- **Clear VuStats Shift Data** — Enter **on-login** to clear shift data for an agent when the agent logs in. Enter **at-midnight** to clear shift data for all agents at midnight.

## Fiber Link Administration

---

This form administers fiber links, each of which is identified by a fiber number.

 **NOTE:**

Fiber link administration only applies to R5r and later configurations.

Port networks (PNs) are connected via direct fiber link connections or through a center stage switch (CSS) to provide the interconnection of port networks required for voice/data information transfer. The CSS is composed of "switch nodes" that can be interconnected in one or two levels to provide Port Network Connectivity (PNC). The CSS provides circuit-switched connectivity for voice and data communications as well as packet-switched connectivity. Fiber link administration permits an administration of translation data associated with a switch connection (such as optical fiber, metallic cable, or DS1CONV circuit packs and DS1 facility links between two endpoints). The two fiber endpoints can be:

- An expansion interface (EI) circuit pack
- A switch node interface (SNI) circuit pack

 **NOTE:**

Only one administrative terminal can administer fiber links at a time; others can display fiber link information.

### Administration commands

---

Use the following commands to administer the Fiber Link Administration form.

| Action  | Object     | Qualifier <sup>1</sup>  |
|---------|------------|-------------------------|
| add     | fiber-link | link number or ['next'] |
| change  | fiber-link | link number             |
| display | fiber-link | link number             |
| list    | fiber-link | link number             |
| remove  | fiber-link | link number             |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

PNCs have three different reliability configurations (one for each system reliability configuration) as follows:

| System Configuration | PNC  |
|----------------------|--|
| Standard Reliability | Simplex Fibers   |
| High Reliability     | Simplex Fibers to Expansion Port Networks and Duplicated Fibers between Processor Port Networks (PPN) and Switch Nodes |
| Critical Reliability | Duplicated Fibers  |

### Simplex PNC

For Simplex PNC, PNC Duplication is disabled on the System-Parameters Customer-Options form and Operation of Duplication is disabled on the Duplication-Related System-Parameters form.

### Administration of PNC Duplication

The PNC Duplication feature is enabled on the System-Parameters Customer-Options form and Operation of Duplication is enabled on the Duplication-Related System-Parameters form. When PNC Duplication is enabled on the System-Parameters Customer-Options form, the following administration forms change:

- Cabinet form — Additional fields appear to allow administration of switch nodes to A-PNC and B-PNC sides of the CSS. The B-PNC is the duplicated hardware for the A-PNC. Either the A-PNC or the B-PNC can provide full customized service. B-PNC cannot be used in a simplex PNC configuration. Pairing of switch nodes is also defined here.
- Fiber Link form — Additional fields appear to allow administration of fiber links on the B-PNC side of the CSS. If an endpoint on the A-PNC side is administered as an SNI, its corresponding endpoint on the B-PNC side is determined (if switch nodes are paired in the cabinet form prior to this administration) and displayed. However, administration of the duplicate B-PNC link is not enforced until duplication is in full operation.
- Duplication-Related System-Parameters form — An additional field appears to enable operation of PNC duplication.

## Form instructions

### Screen 5-56. Fiber Link Administration form

#### Basic Fiber Link Administration

The following fields appear:

- **Fiber Link #** — Display-only field. From the command line, enter a 1- to 3-digit number to uniquely identify a switch connection in the system and its duplicate if appropriate.
- **Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of an SNI or EI board that is the first endpoint of the fiber link.
- **Board Type** — Display-only field showing the type of circuit pack in Endpoint-1.
- **Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of an SNI or EI board that is the second endpoint of the fiber link.
- **Board Type** — Display-only field showing the type of circuit pack in Endpoint-2.
- **Is one endpoint remoted via a DS1 Converter Complex?** — Enter **y** to specify that a DS1 Converter complex is used to remote one endpoint. If a **y** is entered, A-PNC DS1 Converter circuit pack Location must be administered on Page 1. A-PNC DS1 Converter circuit pack Type displays. A-PNC DS1 Converter (DS1CONV) Attributes must be administered on Page 2 of this form.

Screen 5-57. Fiber Link Administration form (page 1 of 3)

The following fields appear when Administration of PNC Duplication is enabled on the System-Parameters Customer-Options form:

- **Fiber Link #** — Display-only field. From the command line, enter a 1- to 3-digit number to uniquely identify a switch connection in the system and its duplicate if appropriate.
- **Is one endpoint remoted via DS1 Converter Complex?** — Enter **yes** to specify that a DS1 converter complex is used to remote one endpoint. If **yes** is entered, A-PNC and B-PNC DS1 Converter (DS1CONV) Attributes must be administered on Pages 2 and 3 (respectively) of the form.
- **Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of a circuit pack in the first endpoint of the duplicate fiber link. Endpoint-1's duplicate along with Endpoint-2's duplicate make up the duplicate fiber link called the B-PNC link.
- **Board Type** — Display-only field showing the type of circuit pack in Endpoint-1. The circuit pack type in Endpoint-1 (A-PNC) and Endpoint-1 (B-PNC) must be the same.
- **DS1CONV Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of DS1 Converter circuit pack in the first endpoint of the duplicate fiber link. Endpoint-1's duplicate along with Endpoint-2's duplicate make up the duplicate fiber link called the B-PNC link.

- **DS1CONV Board Type** — Display-only field showing the type of DS1 Converter circuit pack in Endpoint-1. The circuit pack type in Endpoint-1 (A-PNC) and Endpoint-1 (B-PNC) must be the same. This field is updated via the Change Circuit-packs command.
- **Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of a circuit pack in the second endpoint of the duplicate fiber link. Endpoint-2's duplicate along with Endpoint-1's duplicate make up the duplicate fiber link called the B-PNC link.
- **Board Type** — Display-only field showing the type of circuit pack in Endpoint-2. The circuit pack type in Endpoint-2 (A-PNC) and Endpoint-2 (B-PNC) must be the same.
- **DS1CONV Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of DS1 Converter circuit pack in the second endpoint of the duplicate fiber link. Endpoint-2's duplicate along with Endpoint-1's duplicate make up the duplicate fiber link called the B-PNC link.
- **DS1CONV Board Type** — Display-only field showing the type of DS1 Converter circuit pack in Endpoint-2. The circuit pack type in Endpoint-2 (A-PNC) and Endpoint-2 (B-PNC) must be the same. This field is updated via the Change Circuit-packs command.

Facility A Circuit ID: 09876543

The following DS1 Converter Complex fields appear on Page 2 when the Is one endpoint remoted via a DS1 Converter Complex field is **y**.

 **NOTE:**

When you administer DS1 Converter TN1654 circuit packs, different fields display.

- **DS1CONV Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of the converter circuit pack connected to the first endpoint of the fiber link. This is entered on Page 1 and displays on Page 2.
- **DS1CONV Board Type** — Display-only field showing the type of DS1 Converter circuit pack for the first endpoint.
- **DS1CONV Board Location** — Enter the cabinet, carrier, and slot that identifies the physical location of the converter circuit pack connected to the second endpoint of the fiber link.
- **DS1CONV Board Type** — Display-only field showing the type of DS1 Converter circuit pack for the second endpoint. This field is updated via the Change Circuit-packs command.
- **Facility Installed** — Enter **yes** in the B, C, and D columns under the DS1 Converter Facilities heading to indicate that this DS1 facility is physically installed. At least facility A must be installed within the converter complex. Default is **yes** for Facility A.
- **Passes Far-end Clock** — Enter **"yes"** in the B, C, and D columns under the DS1 Converter Facilities heading to indicate that this DS1 facility is suitable to be used as a clock source. If the DS1 signal does not come directly from the far end converter circuit pack or the network (such as when the signal is converted from digital to analog and then back to digital), enter **"no."** Default is **yes** for Facility A.

This field determines whether the DS1 converter circuit pack can use receive DS1 signal timing to time the transmit fiber signal. This is necessary for passing timing from a master PN to a slave PN across a Converter Complex.

- **Digital Data Compatible** — Enter **yes** (default) in the B, C, and D columns under the DS1 Converter Facilities heading to indicate that this DS1 facility is suitable for transmission of digital data. At least Facility A must be suitable for transmission of digital data. If Customer Premises Equipment that alters digital data exists on this facility (such as with a channel expansion multiplexer), enter **no**.
- **Line Coding** — Enter the line coding format, **ami-zcs** (default), or **ami-basic**, **b8zs**, or **hdb3** in the A, B, C, and D columns under the DS1 Converter Facilities heading for each DS1 facility.

When ami-zcs line coding is used, all-zero bytes are prevented from being transmitted on the DS1 facility because a 1 is arbitrarily written into the second position of each byte. Thus, if no measures are taken to prevent it,

ami-zcs line coding results in data corruption. The DS1CONV circuit pack protects the packet facility (one of up to four facilities dynamically allocated by the DS1CONV circuit pack) from corruption through a special escape mechanism.

When b8zs line coding is used, it maintains DS1 facility's ones-density requirements by encoding a zero data byte into a specific unique pattern of bipolar violations on the DS1 line. The opposite end recognizes this pattern and replaces it with a zero data byte when the data is recovered at the receiving end.

**⇒ NOTE:**

Note that although the esf framing mode and b8zs line coding are the preferable modes of operation, you should confirm that the DS1 facilities support them before selecting this line coding.

- **Framing Mode** — Enter the framing format, **esf** (default) or **d4**, in the A, B, C, and D columns under the DS1 Converter Facilities heading for each DS1 facility.

**⇒ NOTE:**

The D4 format is supported by the Converter circuit packs, but because of problems inherent with this format (specifically, inability to frame on a bit stream that contains data that emulates the D4 framing pattern), its use is discouraged.

- **DS1CONV-1 Line Compensation** — Enter the line compensation (**1 to 5**) in the A, B, C, and D columns under the DS1 Converter Facilities heading for each DS1 facility connected to ENDPOINT-1 (see [Table 5-3](#)).

The DS1 line signal is pre-equalized at the transmitter so that DS1 line pulses are the correct amplitude and shape when they reach the Network Interface. The amount of equalization necessary is determined by the distance to the Network Interface (when the endpoint supplies a DSX-1 interface) and also by the type of wiring used to connect to the Network Interface. The types of wiring allowed are 22 gauge ABAM (shielded twisted pair) cable, 24 gauge Premises Distribution System (PDS) wiring, and 26 gauge PDS wiring.

**Table 5-3. Distance to DSX-1 Interface (feet)**

| Equalizer Setting | 22 AWG ABAM & 24 AWG PDS | 26 AWG PDS |
|-------------------|--------------------------|------------|
| 1                 | 1 to 133                 | 0 to 90    |
| 2                 | 133 to 266               | 90 to 180  |

*Continued on next page*

Table 5-3. Distance to DSX-1 Interface (feet — *Continued*)

| Equalizer Setting | 22 AWG ABAM & 24 AWG PDS | 26 AWG PDS |
|-------------------|--------------------------|------------|
| 3                 | 266 to 399               | 180 to 270 |
| 4                 | 399 to 533               | 270 to 360 |
| 5                 | 533 to 655               | 360 to 450 |

 **NOTE:**

The line equalization setting defaults to 2 and remains in effect until changed by administration. Because incorrect equalizer settings cause a potentially higher error rate on the DS1 facility, it is necessary to provide the correct settings based on the distance to the Network interface.

If it is a TN574 circuit pack, the default for all facilities is 1.

- **DS1CONV-2 Line Compensation** — Enter the line compensation (1 to 5) in the A, B, C, and D columns under the DS1 Converter Facilities heading for each DS1 facility connected to ENDPOINT-2 (see [Table 5-3](#)). The DS1 line signal is pre-equalized at the transmitter so that DS1 line pulses are the correct amplitude and shape when they reach the Network Interface. The amount of equalization necessary is determined by the distance to the Network Interface (when the endpoint supplies a DSX-1 interface) and also by the type of wiring used to connect to the Network Interface. The types of wiring allowed are 22-gauge ABAM (shielded twisted pair) cable, 24-gauge Premises Distribution System (PDS) wiring, and 26-gauge PDS wiring.
- **Facility A Circuit ID** — Displays when the value in `Facility Installed` for Facility A is **yes**. Enter up to 40 characters to identify the cabinet, carrier, and slot of the DS1 Converter circuit pack's physical location.

Similarly, Facility B Circuit ID, Facility C Circuit ID, and Facility D Circuit ID fields display for each of the DS1 Converter Facilities when **yes** is entered in the corresponding Facility Installed field.

### Screen 5-60. Fiber Link Administration form for T1 TN1654 Circuit Pack (DS1 Converter Complex Administration) (page 2 of 3)

The following unique fields display when administering a T1 TN1654 DS1 Converter.

- **Bit Rate** — Displays when the DS1 Converter circuit pack is TN1654. Enter either **1.544** for domestic T1 operation or **2.048** for international E1 operation.

**NOTE:**

Since one bit rate applies for all facilities within the same DS1 Converter complex, the `Bit Rate` field displays only under Facility A.

- **Facility Startup Idle Code**— Displays when the DS1 Converter circuit pack is TN1654. Enter 8 digits, each digit must be **0** or **1**. The second digit must be **1**. Default is **11101000**. You can administer this field on a per circuit pack basis. This is the idle code used when a TN1654 first establishes a link on a T1/E1 facility. The initial idle code used by the TN1654 is overwritten by the center stage switch to an “all ones” pattern once framing is established on that T1/E1 facility.
- **Framing Mode** — For TN1654 with 1.544 Mbps Bit Rate, this is a display-only field.

### Screen 5-61. Fiber Link Administration form for E1 TN1654 Circuit Pack (DS1 Converter Complex Administration) (page 2 of 3)

The following unique fields display when administering a TN1654 DS1 Converter.

- **Bit Rate** — A display-only field for TN1654 entered on page 3 of the form. See previous section. **1.544** indicates domestic T1 operation and **2.048** indicates international E1 operation.

### DS1 Converter Complex Administration for E1 TN1654 Circuit Packs

The following unique fields display when administering a E1 TN1654 DS1 Converter.

- **Bit Rate** — Displays when the DS1 Converter circuit pack is TN1654. Enter either **1.544** for domestic T1 operation or **2.048** for international E1 operation.

**NOTE:**

Since one bit rate applies for all facilities within the same DS1 Converter complex, *Bit Rate* displays only under Facility A. To activate the desired Bit Rate, the toggle switch on the circuit pack must be set and it must correspond to the Bit Rate.

- **Idle Code MSB(1) ... LSB(8)** — Displays when the DS1 Converter circuit pack is TN1654. Enter 8 digits, each digit must be **0** or **1**. The second digit must be **1**. Default is **11101000**. You can administer this field on a per circuit pack basis.

5 Basic Forms

Fiber Link Administration

- **CRC** — Displays when the DS1 Converter circuit pack is TN1654 and the Bit Rate is 2.048 Mbps. Enter **yes** to receive a “yellow 2” alarm for E1 operation. Default is **no**. You can administer this field on a per circuit pack basis.
- **Line Termination** — A display-only field for DS1 Converter circuit packs that are TN1654 and have a Bit Rate of 2.048 Mbps. It identifies facility connections as CEPT 75 ohm coaxial or 120 ohm CEPT twisted pair.

Screen 5-62. Fiber Line Administration form for B-PNC DS1 Converter (DS1CONV) Attributes

## Hunt Group

---

Allows calls to be answered by users (agents) at a predefined group of terminals or devices.

This form creates a hunt group that is identified by a hunt group number. Users assigned to a hunt group are identified by their extension number.

### NOTE:

If `Hospitality Parameter Reduction` is enabled on the `System-Parameters Customer-Options` form, only five hunt groups can be assigned.

This form can be used to implement a hunt group and its associated features such as Automatic Call Distribution (ACD) and Hunt Group Queuing. Look at the various hunt group forms and choose the forms that can be used to implement your hunt group requirements.

The total number of pages vary depending on your System configuration. See the *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference* for the maximum number of hunt groups supported by each configuration.

The System checks for the busy or idle status of extension numbers in the hunt group when answering calls. A Uniform Call Distribution (UCD) type hunt group selects the “most idle” extension in the group when answering a new call. A Direct Department Calling (DDC) type hunt group selects the first available extension (in the administered sequence) when answering a new call. Expert Agent Distribution (EAD), used only with Expert Agent Selection (EAS), selects the “most idle” agent or the “least occupied”<sup>1</sup> agent with the highest skill level for the call’s skill.

### NOTE:

Vector controlled splits/skills can be called directly via the split/skill extension (instead of calling a VDN mapped to a vector that will terminate the call to a vector controlled split/skill); however, the calls will not receive any announcements, be forwarded, redirect to coverage, or intraflow/interflow to another hunt group.

---

1. CentreVu<sup>®</sup> Advocate software is required to select agents on the basis of occupancy. For more information about CentreVu<sup>®</sup> Advocate, contact your Account Executive.

## Administration commands

---

Use the following commands to administer the Hunt Group form.

|   | Action  | Object     | Qualifier <sup>1</sup>        |
|---|---------|------------|-------------------------------|
| Without Hospitality<br>Parameter Reduction<br>Feature | add     | hunt-group | 1-MAX (or 'next')             |
|   | change  | hunt-group | 1-MAX                         |
|   | display | hunt-group | 1-MAX ['print' or 'schedule'] |
|   | list    | hunt-group | ['print' or 'schedule']       |
|   | remove  | hunt-group | 1-MAX                         |
| With Hospitality<br>Parameter Reduction<br>Feature    | add     | hunt-group | 1-5 (or 'next')               |
|   | change  | hunt-group | 1-5                           |
|   | display | hunt-group | 1-5 ['print' or 'schedule']   |
|   | list    | hunt-group | ['print' or 'schedule']       |
|   | remove  | hunt-group | 1-5                           |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered. MAX is the maximum number available in your system configuration.

## Form instructions

---

Make assignments as required for the following fields on each page of the form. [Screen 5-63](#) shows page 1 of the Hunt Group form with all fields displayed.

The two `Extension` fields display only when `Calls Warning Port` and `Time Warning Port` fields are **X**.

Screen 5-66. Hunt Group form (page 1 of X)

- **Group Number** — Enter a hunt group number when completing a paper form (only five hunt groups can be assigned if the Hospitality Parameters Reduction is enabled on the System-Parameters Customer-Options form). This is a display-only field when the form is accessed using an administration command such as **add** or **change**.

- **Group Name** — Enter a 28-character string that uniquely identifies the group (for example, "parts dept," "purchasing," or "sales dept").
- **Group Extension** — Enter an unused extension number (1 to 5 digits) to be assigned to the hunt group.
- **Group Type** — There are five group types: Uniform Call Distribution (ucd-mia and ucd-loa), Direct Department Calling (DDC), and Expert Agent Distribution (ead-mia and ead-loa). Each option uses a different method to select an agent for a call when two or more agents are available.

Enter **ddc** when the call should be routed to the first available agent in the administered string. Group type **ddc** is also known as "hot seat". "ddc" distribution is not available when the group is administered as a skill.

When **ucd-mia** or **ucd-loa** is entered, a call routes to the most-idle agent ("ucd-mia") or the least occupied agent ("ucd-loa"), respectively.<sup>2</sup> Enter **ucd-mia** (default) or **ucd-loa** if the hunt group has an AUDIX or Messaging Server Adjunct message. One of these entries is required when supporting the Outbound Call Management feature and when the "Controlling Adjunct" field is administered as **asai**.

When **ead-mia** or **ead-loa** is entered, a call routes to the available agent with the highest skill level for the call. If two or more agents with equal skill levels are available, DEFINITY ECS routes the call to the most-idle agent ("ead-mia") or the least occupied agent ("ead-loa"), respectively. This allows a call to be distributed to the agent best able to handle the call if multiple agents are available.

**ucd-loa** and **ead-loa** cannot be entered in the Group Type field unless `CentreVu Advocate` is set to **y** on the System Parameters Customer-Options form. **ead-mia** and **ead-loa** cannot be entered in the Group Type field unless `Expert Agent Selection (EAS)` is set to **y**.

- **TN** — Enter the Tenant Partition number. Default is **1**.
- **COR** — Enter the class of restriction (COR) number from **0** through **95** that reflects the desired restriction for the hunt group. If this is a hunt group supporting the AUDIX in a DCS feature, the CORs on the Hunt Group form on each switch must be the same. Default is **1**.
- **Security Code** — Enter a 4-digit security code (password) used for the Demand Print feature. Valid entries are a 4-digit security code or leave blank.
- **ISDN Caller Disp** — Enter **grp-name** or **mbr-name** to specify whether the hunt group name or member name, respectively, will be sent to the originating user. This field is required if the `ISDN-PRI` or `ISDN-BRI Trunks` on the System-Parameters Customer-Options form is enabled. If `ISDN-PRI` or `ISDN-BRI Trunks` is not enabled, this field must be blank.

---

2. Least occupied agent (LOA), is a new agent selection method available on DEFINITY ECS R3V6 and later switches when you purchase CentreVu<sup>®</sup> Advocate software. For more information about CentreVu<sup>®</sup> Advocate, contact your Lucent Account Executive.

- **ACD** — Enter **y** if the hunt group will function as an ACD split/skill. AUDIX and MSA hunt groups can function as ACD splits/skills. This field cannot be set to **y** if the **ACD** option is not enabled on the System-Parameters Customer-Options form. Enter **n** (default) if this feature is not desired, even if **ACD** is enabled on the System-Parameters Customer-Options form. When the hunt group is assigned as an ACD split/skill, the hunt group members serve as ACD agents. The agents in this split/skill must log in to receive ACD split/skill calls. If this hunt group is on a remote switch using the AUDIX in a DCS feature, enter **n**.
- **Queue** — Enter **y** if the hunt group will be served by a queue. Default is **n**.
- **Vector** — Enter **y** to indicate that this hunt group will be vector controlled. **Vectoring-Basic** must be enabled on the System-Parameters Customer-Option form before **y** can be entered in the field. Default is **n**. (See example screen forms for fields that are displayed when this field is set to **y**.)
- **Coverage Path** — Not displayed if **Vector** is **y**. Enter a coverage path number. This assigns a coverage path for the hunt group. The coverage path is assigned using the Coverage Path form. Valid entries vary depending on the system configuration, or leave blank.
- **Night Service Destination** — Not displayed if **Vector** is **y**. Enter the destination where calls to this split will redirect when the split is in the night service mode. Valid entries are an assigned extension number (can be a VDN extension), the attendant group code, or leave blank.
- **MM Early Answer** — This field applies for systems using Multimedia Call Handling only. If **y**, the system begins to answer an H.320 call and establish an audio channel before offering the conversion call to the hunt group.

The following fields display if **Queue** is **y**:

- **Queue Length** — Enter the maximum number of calls that can be in the queue at the same time. This field must have an entry when **Queue** is **y**.
- **Calls Warning Threshold** — Enter the number of calls that can be queued before the System flashes the queue status (feature buttons assigned on agents voice terminals) and the optional Auxiliary Queue Call Warning Threshold lamp assigned to the split/skill. These lamps are lighted steadily when at least one call is in queue and the threshold has not yet been reached. Must be less than or equal to the queue length or leave blank. This field must not be left blank if **Calls Warning Port** is assigned a port number.
- **(Calls Warning) Port** — Enter the seven-character port number assigned to connect the optional external Auxiliary Queue Call Warning Threshold lamp that will flash when the number of calls in queue has exceeded the queue warning threshold (assigned in **Calls Warning Threshold**).

The entry breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 44 |
|            |                | 01 through 03 |
|            |                | 01            |
| 3          | Carrier        | A through E   |
| 4-5        | Slot Number    | 01 through 20 |
| 6-7        | Circuit Number | 01 through 16 |

 **NOTE:**

This port is assigned to an Analog Line circuit pack or given an "X" designation if an extension is used.

- **(Calls Warning) Extension** — An extension is needed when an X is placed in `Calls Warning Port`. This extension can be used by the Terminal Translation Initialization (TTI) feature to assign a port to this extension from the port itself. Once `Calls Warning Port` is assigned a valid port (either via TTI or the **change hunt-group** command), then the extension is removed and considered unassigned.
- **Time Warning Threshold** — Enter the time in seconds (0 through 999, or blank) that a call can remain in the queue before the System flashes the Queue status lamps (feature buttons assigned members voice terminals) and the Auxiliary Queue Time Warning lamp assigned to this split/skill. An entry of "0" provides a warning whenever a call is queued.
- **(Time Warning) Port** — Enter the seven-character port number assigned to the Auxiliary Queue Time Warning lamp that flashes when the time entered in `Time Warning Threshold` has been reached by a call in queue. The entry breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 44 |
|            |                | 01 through 03 |
|            |                | 01            |
| 3          | Carrier        | A through E   |
| 4-5        | Slot Number    | 01 through 20 |
| 6-7        | Circuit Number | 01 through 16 |

 **NOTE:**

This port is assigned to an Analog Line circuit pack or given an "X" designation if an extension is used.

- **(Time Warning) Extension** — An extension is needed when an X is placed in `Time Warning Port`. This extension can be used by the Terminal Translation Initialization (TTI) feature to assign a port to this extension from the port itself. Once `Time Warning Port` is assigned a valid port (either via TTI or the **change hunt-group** command), then the extension is removed and considered unassigned.

Page 2 of the Hunt group form is only displayed when `ACD?` on page 1 is set to **y**. If `ACD?` is set to **n**, page 3 becomes page 2 and all subsequent page numbers are decreased by one.

[Screen 5-67](#) shows page 2 of the form with all fields displayed.

Screen 5-70. Hunt Group form (page 2 of X)

The Vu Stats Objective field does not appear unless VuStats is enabled on the System-Parameters Customer-Options form and either **internal** or **both** is in the Measured field on this form.

Service Level Supervisor is displayed because the ACD and Skill fields are set to **y** and the CentreVu Advocate field on the System-Parameters Customer-Options form is set to **y**. The fields Level 1 Threshold (sec) and Level 2 Threshold (sec) are only displayed when Service Level Supervisor is set to **y**.

- **Skill** — Only appears if Expert Agent Selection is enabled on the System-Parameters Customer-Options form. Enter **y** if this hunt group is an EAS skill.

**NOTE:**

If this field is **y**, then Group Type must be **ucd** or **ead**.

- **AAS** — Displays when the ACD field for this hunt group is **y**. Enter **y** when this hunt group will serve as an Auto-Available Split.
- **Measured** — Enter **internal** to have measurement data for the ACD split/skill collected (internal to the switch) for VuStats or BCMS. This measurement data is collected for VuStats and BCMS only if they are optioned on the System-Parameters Customer-Options form. If you enter **internal** in the measured field and neither VuStats nor BCMS is optioned on the System-Parameters Customer-Options form, the system displays the following message:

<value> cannot be used; assign either BCMS or VuStats first

Contact a Lucent Technologies representative to assist with any changes you want to make on the System-Parameters Customer-Options form.

Enter **external** to have measurements made by the Call Management System (external to switch).

Enter **both** to have measurements collected both internally and externally.

Enter **none** (default) if measurement reports for this hunt group is not required.

- **Supervisor Extension** — Enter the extension number (cannot be a VDN number) of the ACD split/skill supervisor that agents will reach when using the Assist feature.
- **Priority On Intraflow** — Not displayed if `Vector` is **y**. Enter **y** if calls intraflowing from this split to a covering split will be given priority over other calls waiting in the covering split queue. Default is **n**.
- **Inflow Threshold** — Enter the number of seconds (**0** through **999**) that a call can remain in the queue before no more calls will be accepted by the queue. If **0** is entered, a call is redirected to this split/skill only if there is an available agent. This field displays only when `Vector` is **n** and `Queue` is **y**.
- **Controlling Adjunct** — Enter **none** to indicate that members of the split/skill or hunt group are not controlled by an adjunct processor. When set to **asai**, all agent logins are controlled by an associated adjunct and logged-in agents can only use their data terminal keyboards to perform voice terminal functions (for example, change work state). If the controlling adjunct is a CONVERSANT voice system (requires an ASAI link), then enter **asai** in this field. (The ASAI option must be enabled on the System-Parameters Customer-Option form for CallVisor ASAI capability.)
- **Adjunct Link Extension** — Displays when `Controlling Adjunct` is **asai** or **adjlk**. Enter the appropriate ASAI Link extension (see [“CallVisor Adjunct-Switch Application Interface” on page 4-250](#)). This field cannot be blank.
- **Multiple Call Handling** — Displays only if `Multiple Call Handling` on the System-Parameters Customer-Options form is set to **y**. This field defines whether the hunt group can have multiple call handling capabilities, and if so, what type. Valid entries are **none**, **on-request**, **many-forced**, **one-forced**, or **one-per-skill**. **One-Per-Skill** is only valid in an EAS environment and only when `Skills` is **y**. Default is **none**.
- **Acceptable Service Level (sec)** — Enter the number of seconds within which calls to this hunt group should be answered. This allows BCMS and/or VuStats to report a percentage of calls that were answered within the specified time. This entry is also used by the CentreVu® Advocate Service Objective feature. Valid entries are **0** through **9999** seconds. Default is 30.
- **Expected Call Handling Time (sec)** — This field appears only if either `Vectoring (Advanced Routing)` or `CentreVu Advocate` on the System-Parameters Customer-Options form is **y**. Enter a number from **1** to

**9999** to establish the number of seconds for expected call handling. This value is used to initialize Expected Wait Time and is also used by the CentreVu<sup>®</sup> Advocate Percent Allocation feature.

- **VuStats Objective** — Enter a numerical user-defined objective. An objective is a split or skill goal for the call. This could be an agent objective such as a specific number of calls handled or an average talk time. The objective could also be a percent within the service level. The objective appears on the VuStats display and allows agents and supervisors to compare the current performance against the value of the objective for the split or skill.

You can use this value in a customized VuStats display format if the value in the `Object Type` field on the VuStats display format form is either **agent**, **agent-extension**, or **split**.

This field appears only if `VuStats` is enabled on the System-Parameters Customer-Options form and either **internal** or **both** is entered in the `Measured` field on this form.

- **Timed ACW Interval** — When a value is entered in this field, an agent in auto-in work mode who receives an ACD call from this hunt group is placed automatically into After Call Work (ACW) when the call drops. Enter the number of seconds the agent should remain in ACW following the call. When the administered time is over, the agent automatically becomes available. Timed ACW cannot be administered if the hunt group is adjunct controlled, is an AUDIX Message Center, or is an auto-available split. `Timed ACW Interval` displays only if the Timed ACW option is enabled on page 3 of the System Parameters Customer-Option form.
- **Service Level Supervisor** — This feature is part of CentreVu<sup>®</sup> Advocate, an integrated software package for optimizing call center performance, and only appears if `CentreVu Advocate` is set to **y** on the System Parameters Customer-Options form and `Skill` is set to **y** on the Hunt Group form. For more information on CentreVu<sup>®</sup> Advocate, contact your Account Executive.
- **Level 1 Threshold (sec)** — This field is used with Service Level Supervisor and only appears if Service Level Supervisor is enabled.
- **Level 2 Threshold (sec)** — This field is used with Service Level Supervisor and only appears if Service Level Supervisor is enabled.
- **Redirect on No Answer (rings)** — Enter the maximum number of rings (1 to 20, or blank) before a call will redirect back to the split/skill, or to the administered VDN. Blank deactivates RONA.
- **Redirect to VDN** — To redirect a RONA call to a VDN instead of to the split/skill, enter the extension number of the VDN. The administered VDN must be on-premises and must be administered on the system. The VDN can specify a vector that will in turn route to an off-premises VDN. You cannot enter an extension in this field if `Redirection on No Answer (rings)` is blank. Direct Agent calls go to the agent's coverage path if it is administered. If not, the calls go to a VDN.

- **Forced Entry of Stroke Counts or Call Work Codes** — Displays only when `Controlling Adjunct` is **none**. Enter **y** if either a Stroke Count or Call Work Code must be entered for each call answered by an agent when in the Manual-In mode.

### Page 3 of the form

```

change hunt-group 1                                     Page 3 of 39
                                     HUNT GROUP
                                     Message Center: _____
                                     AUDIX Extension: _____
Message Center AUDIX Name: _____
                                     Primary? _
Calling Party Number to INTUITY AUDIX? _
                                     LWC Reception: _____
                                     AUDIX Name: _____
                                     Messaging Server Name: _____

First Announcement Extension: _____ Delay (sec): __
Second Announcement Extension: _____ Delay (sec): __ Recurring? _
    
```

### Screen 5-71. Hunt Group form (page 3 of X)

- **Message Center** — Enter the type of messaging adjunct for the hunt group. Valid entries are **msa** (Messaging Server Adjunct), **rem-audix** (DCS feature allowing AUDIX to be located on another switch), or **audix** (for AUDIX located on this switch). Entering **none** (default) indicates the hunt group does not serve as a message hunt group. Only one hunt group in the System can be administered as **msa**, one as **audix**, and one as **rem-audix**.
- **AUDIX Extension** — Displays when `Message Center` is **rem-audix**. Enter a valid 4- to 5-digit Uniform Dial Plan (UDP) extension that identifies the AUDIX hunt group on the host switch used as the Message Center for this hunt group (supports the AUDIX In DCS arrangement).
- **Message Center MSA Name** — Only appears on R5r and later configurations for hunt groups with `Message Center` set to **msa**. Enter the name of the Message Center MSA. (This field is not shown above. When displayed, it replaces `Message Center AUDIX Name`.)
- **Message Center AUDIX Name** — Only appears on R5r and later configurations for hunt groups with `Message Center` set to **audix** or **rem-audix**. Enter the name of the Message Center AUDIX.
- **Primary** — Only appears on R5r and later configurations for hunt groups with `Message Center` set to **audix**, **rem-audix**, or **msa**. Enter **y** to indicate that the specified AUDIX or Messaging Server is the primary adjunct.

- **Calling Party Number to INTUITY AUDIX** — Enter **y** to send the calling party number to INTUITY AUDIX. Enter **n** if you do not wish to communicate the calling party number to INTUITY AUDIX.
- **LWC Reception** — Defines the destination for Leave Word Calling (LWC) messages left for the hunt group. Valid entries are **audix**, **msa**, **spe**, or **none**.
- **AUDIX Name** — Only appears on R5r and later configurations. Enter the name of the AUDIX machine as it appears on the User-Defined Adjunct Names form.
- **Messaging Server Name** — Name of the server as it appears in the User-Defined Adjunct Names form. Only displayed for R5r and later configurations.
- **First Announcement Extension** — Displays when `Queue` is **y**. Not displayed if `Vector` is **y**. Enter a recorded announcement extension number or leave blank. This is the announcement the caller receives after being in the queue for the time interval specified in `First Announcement Delay`. If the call hasn't been answered after the announcement, the caller hears music (only after the first announcement) if Music-on-Hold is provided, or ringing for as long as it remains in the queue. Leaving this field blank indicates there will be no announcement. If this is the forced first announcement, the caller always hears ringback after the announcement; otherwise, the caller hears music (if provided).
- **First Announcement Delay (sec)** — Displays only if `Queue` is **y** and `Vector` is **n**. Enter the number of seconds (**0** through **99**) that a call remains in queue before the associated first announcement is given the calling party. The call retains its place in the queue while the caller is listening to the recorded announcement. If the call hasn't been answered after the announcement, the caller hears music (for first announcement only) if Music-on-Hold is provided or ringing for as long as the call remains in queue. When **0** is entered, the first announcement is provided immediately to the caller. This value is set automatically to **0** if there is no queue. This field must be blank if there is no first announcement.

The following fields display only when `ACD` and `Queue` both are **y** and `Vector` is **n**:

- **Second Announcement Extension** — Enter the extension number assigned to a recorded announcement or leave blank. Leaving the field blank indicates there is no second announcement.
- **Second Announcement Delay (sec)** — Enter the time in seconds (1 through 99) before the call in the queue receives a second recorded announcement or that the second announcement is repeated. It is recommended that, if this split/skill or hunt group is a coverage point for another split/skill, this delay should not be more than 15 seconds. Leave blank if there is no second announcement.

- **Second Announcement Recurring** — Enter **y** if the second announcement can be repeated. Leave blank if there is no second announcement.

Screen 5-72. Hunt Group form (page 4 of X)

**NOTE:**

Only Pages 1, 2, and 3 display if the hunt group is skilled.

- **Group Number** — Display-only field
- **Group Extension** — Display-only field
- **Group Type** — Display-only field
- **Member Range Allowed** — The range of allowed members displays on all member pages. These values vary depending on the particular system and/or configuration.
- **Administered Members (min/max)** — Displays on all member pages. Indicates the minimum and maximum member number administered for this hunt group.
- **Total Administered Members** — Displays on all member pages. Indicates the total number of members administered for this hunt group.
- **More Members Exist** — Display-only field showing there are more members than currently displayed (the current page is not the last page).

- **At End of Member List** — Display-only field showing the current page is also the last page.
- **Ext** — Display-only field if Controlling Adjunct is **asai**. Controlled Agent extensions must be entered on the Adjunct Controlled Agent Table form. If Controlling Adjunct is "**none**," enter the extension number associated with a member in the hunt group or with an associated data module. The extension cannot be a VDN. The data module cannot be a member of an ACD split/skill.
- **Name** — Make no entry. This is a display-only field. The name is assigned to the above extension number when it is administered in the System.

## List Hunt Group form

| HUNT GROUPS |               |             |             |     |      |         |         |          |                |          |                |

### Screen 5-73. List Hunt Group form (page 1 of X)

- **Grp No.** — The number of a hunt group.
- **Grp Ext.** — The extension of the hunt group.
- **Name** — The name administered for the hunt group.
- **Grp Typ** — The type of the hunt group. See the `Group Type` field description for page 1 of the Hunt Group form.
- **ACD/MEAS** — Indicates whether the hunt group will function as an ACD split/skill (**y** or **n**) and how it is measured (**I**, **B**, or **N**). See the `ACD` and `Measured` field descriptions for Page 1 of the Hunt Group form.
- **Vec** — An indicator (**y** or **n**) of whether the hunt group is controlled by a vector. See the `Vector` field description for page 1 of the Hunt Group form.
- **MCH** — The MCH type assigned to the hunt group. Values are:
  - **none**
  - **req** for on-request
  - **one** for one-forced

- **per** for one-per-skill
- **many** for many-forced
- **Que Siz** — The maximum number of calls that can be in queue for the hunt group.
- **No. Mem** — The actual number of hunt group members.
- **Cov Path** — The number of the coverage path for the hunt group.
- **Notif/Ctg Adj** (Notifying/Controlling Adjunct) — An indicator of notification (**N**) or controlling adjunct (**C**), or none (**n**). If the `Notification` field displays **N**, it also contains the extension of the ASAI application link that has the notification. You can have up to three ASAI applications monitoring a single hunt group. If the field contains **C**, it also displays the extension of the controlling adjunct. You can have one controlling adjunct for each hunt group.
- **Dom Ctrl (Domain Control)** — Displays the extension of the ASAI link over which the domain split is set up.
- **Message Center** — An indicator of the type of message (if any) used. See the `Messaging Center` field description for page 2 of the Hunt Group form.

## Intercom Group

---

The Automatic and Dial Intercom features are available to users whose voice terminals have intercom feature button assignments. Members of an intercom group may have Dial Intercom, Automatic Intercom, both, or neither with respect to placing an Intercom call. Single-line voice terminals, if a member of the group, can receive an Intercom call, but cannot place an Intercom call.

This form specifies the group members, not the type of Intercom. (The intercom type and associated feature buttons are assigned to multi-appearance voice terminals using the multi-appearance voice terminal forms.)

### Administration commands

---

Use the following commands to administer the Intercom Group form.

| Action  | Object             | Qualifier <sup>1</sup>   |
|---------|--------------------|--|
| add     | intercom<br>-group | 1-MAX (or 'next')  |
| change  | intercom<br>-group | 1-MAX  |
| display | intercom<br>-group | 1-MAX ['print' or 'schedule']  |
| list    | intercom<br>-group | [1-MAX]['number' x]['to-number' x]['count' n]['print' or 'schedule'] |
| remove  | intercom<br>-group | 1-MAX  |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the number available in your system configuration.

### Form instructions

---

Make assignments as required for the following fields on each page of the form:

## Pages 1 and 2 of the form

```

change intercom-group 1                                     Page 1 of 2   SPE B
                                                           INTERCOM GROUP
                                                           Group Number: 1
                                                           Length of Dial Code: 1

### Screen 5-74. Intercom Group form (page 1 of 2)

- **Group Number** — Enter a Group number (1 to 3 digits) when completing a paper form. This is a display-only field when the form is accessed using an administration command such as **add** or **change**.
- **Length of Dial Code** — On Page 1, enter **1** or **2**. This is the number of digits that must be dialed to access someone in the group. Enter **1** (default) if group members are fewer than ten or "2" if group members are ten or more. (On Page 2, this is a display-only field.)
- **Ext** — Enter the extension number of each member of the group. VDN extensions are not allowed.
- **DC** — Enter a 1- or 2-digit code. The number of digits entered depends on the number assigned in **Length of Dial Code**. This field cannot be left blank. This is the code that must be dialed to access that group member.

**NOTE:**

If "2" was entered in **Length of Dial Code**, a 2-digit code must always be dialed. For example, to access member number 8 with a 2-digit dial code specified, "08" must be dialed.

- **Name** — Make no entry. The name is assigned when the member's associated extension was administered.

## Inter-Exchange Carrier (IXC) Codes

This form allows identification of the IXC in the CDR record.

### Administration commands

Use the following commands to administer the Inter-Exchange Carrier Codes form.

| Action  | Object    | Qualifier <sup>1</sup>  |
|---------|-----------|-------------------------|
| change  | ixc-codes | —                       |
| display | ixc-codes | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

### Form instructions

Make assignments as required for the following fields on each page of the form:

#### Page 1 of the form

Page 1 of 2

INTER-EXCHANGE CARRIER CODES

IXC Codes Assignments (Enter up to 15)

| CDR  | IXC    | IXC Name | CDR  | IXC    | IXC Name |

5 Basic Forms  
Inter-Exchange Carrier (IXC) Codes

Page 5-178

- **IXC Access Number** — Enter the digits dialed or inserted by AAR/ARS into the outpulsed digit string to gain access to the interexchange carrier. No duplicate access numbers are allowed in the table.
- **IXC Name** — Enter 0 to 15 characters to identify the IXC. This description is for information purposes only.

Page 2 of the form

Page 2 of 2

|    | IXC Prefix | IXC Code Format |
|----|------------|-----------------|
| 1. | ___        | ___             |
| 2. | ___        | ___             |
| 3. | ___        | ___             |
| 4. | ___        | ___             |
| 5. | ___        | ___             |

Screen 5-76. Inter-Exchange Carrier Codes form (page 2 of 2)

- **IXC Prefix** — Enter a valid 1 to 3 digit prefix.
- **IXC Code Format** — Enter a valid 2 to 4 digit code format, or enter **x** or **X**.

## Interface Links

This form identifies, describes, and enables Interface Links. There is one Interface Link form per System. Interface Links provide a physical interface between the system and the other nodes in a DCS, ISDN, a Message Server Adjunct, a CMS, an ISDN Gateway adjunct (supports CPN/BN), or AUDIX.

### Administration commands

Use the following commands to access the Interface Links form.

| Action  | Object                  | Qualifier <sup>1</sup>        |
|---------|-------------------------|-------------------------------|
| change  | communication-interface | links                         |
| display | communication-interface | links ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

| 14:             | -       | _____          | _____              | -                    | _____                 | _____          |
| 15:             | -       | _____          | _____              | -                    | _____                 | _____          |
| 16:             | -       | _____          | _____              | -                    | _____                 | _____          |

Screen 5-78. Interface Links form (R5r and later configurations) — Example Only

Make assignments as required for the following fields on the form:

- **Link** — A display-only field. Indicates the interface link number that connects to another node in a DCS network, a Message Server, CMS, ISDN Gateway, or AUDIX. Interface Links always terminate on a port in a PGATE circuit pack for R5r and later configurations or on the PI circuit pack for R5si configurations.
- **Enable** — Enter **y** to enable the link. Enter **n** (default) to suppress any message flow over the link.
- **Est Conn** — Displays for R5si and later configurations only. Enter **y** if the System is responsible for any part of the call setup required for the link between the System and the far-end data module.

If the physical link is through a pair of MPDMs or MTDMs, then each switch terminating the link must set up a connection between its Processor Interface Data Module and MPDM/MTDM.

If the physical link is over a DS1 interface, it is possible (except for ISDN signaling links) for one switch to set up the entire connection (see Destination below). In this case, the other switch will not initiate any part of the connection between the two endpoints. Typically when using a DS1 interface, the **Enable** field is **y** on both the originating and terminating switches but only one link between the two switches will have **Est Conn** set to **y**. The originating switch is defined as having **Est Conn** set to **y**.

If the link is to be used for ISDN signaling, enter **y**.

- **X.25 Extension** — Displays for R5r and later configurations only. Automatically displays the extension of a previously administered X.25 data module connected to the Adjunct.
- **PI Ext** — Displays for R5si and later configurations only. This is the data extension assigned on the Processor Interface Data Module form. This is a display-only field. If the data module has not been administered, this field will be blank.
- **Destination Number** — Displays for R5r and later configurations only. To connect the Adjunct via the cable on the back of the PGATE circuit pack, enter **external**.

**NOTE:**

If a value other than **external** is used, the associated X.25 data module must have a baud rate of **switched**.

This field can be left blank assuming the other side will call it; however, it is equivalent and preferable to put in the actual digits of the other side and set *Establish Connection* to **n**. This allows you to identify which X.25 data module on the remote switch is expected to call this data module.

- **Prot** — Displays for R5si and later configurations only. Enter the protocol type that is to be established on the link. Valid entries are **bx.25** (default), and **isdn**.
- **Establish Connection** — Displays for R5r and later configurations only. This field displays when a string of digits is entered in *Destination Number*. Enter **y** if the System is responsible for any part of the call setup required for the link between the System and the far-end data module.
- **Destination** — Displays for R5si and later configurations only. Leave blank if the System is not involved in establishing any part of the connection (may not be a VDN extension).

For BX.25 links [allowable entries are extension number, **TAC** (for DS1 data link), or **eia** (link 1 only)]:

**NOTE:**

An **eia** entry is valid only for Simplex systems.

- Enter the extension number in the Digits field that is used to set up a connection or part of a connection between the local and far-end data modules for the link.
- If the BX.25 link is through a pair of PDMs or TDMs, then use the extension of the PDM/TDM as the destination address.
- If the BX.25 link is through a DS1 interface and the local switch is establishing the connection, enter the TAC if the far-end trunk group is administered with an incoming destination (for example, the far-end data module extension). Otherwise, enter the TAC followed by the far-end data module extension.

For ISDN links:

- Enter the DS1 circuit pack address previously administered as using ISDN signaling in the `Brd` field.

If the last channel on the DS1 circuit pack is used for Facility Associated Signaling, it cannot be administered as a member of the trunk group. A DS1 circuit pack address can only appear once as a destination address on the form. Allowable entries are the 5-character DS1 circuit pack location. The first character identifies the network (1 through 3, default is 1 if no entry); the second character identifies the carrier (A through E); the third and fourth characters identify the slot number in the carrier (01 through 20 for multi-carrier cabinets depending on carrier type or 01 through 18 for single-carrier cabinets depending on cabinet type).

- **Connected Data Module** — Displays for R5r and later configurations only.
- **DTE/DCE** — Displays for R5si and later configurations only. Enter **DTE** (default) or **DCE** to define the type of interface. This field is only administrable if `Prot` is **bx.25**. If one endpoint of a link is DTE, then the other must be DCE, and vice versa. The assignments must be coordinated on a network-wide level. Endpoint Switch Links are generally DTE and Tandem links are generally DCE. If both endpoints are of the same type (that is, endpoints or tandem), then the assignment of which is DTE and which is DCE is arbitrary. Typically, when using a DS1 interface, the originating switch should be administered as **DTE** and the terminating switch as **DCE**.
- **Identification** — Enter a 15-character name for the link. Used for identification purposes only. It may be used to identify the destination machine or left blank.
- **Link 1 [eia] — Connected to** — Displays only when **eia** is entered in `Destination` and applies only to Link 1. This field defines the physical characteristics of the device connected to the `eia` port and only refers to the physical layer of the protocol (which lines send and receive data, and so on) and not to the link layer which is controlled by the DTE/DCE field. Valid entries are **dte** and **dce** (default).
- **Clocking** — Displays only when **eia** is entered in `Destination` and applies only to Link 1. This field sets the clocking for the physical layer of the protocol. Entering **internal** states the clocking is provided by the `eia` port, and **external** (default) states that clocking is provided by the other end of the link. One end of the link should be set to **internal** and the other end should be set to **external**.

## Intra-Switch CDR

---

This form administers extensions for which Intra-Switch CDR is to be enabled.

 **NOTE:**

Attendants are not allowed to be optioned for the Intra-Switch CDR feature.

### Administration commands

---

Use the following commands to administer the Intra-Switch CDR form.

| Action  | Object           | Qualifier <sup>1</sup>             |
|---------|------------------|------------------------------------|
| add     | intra-switch-cdr |                                    |
| change  | intra-switch-cdr | [extension]                        |
| display | intra-switch-cdr | [extension]['print' or 'schedule'] |
| list    | intra-switch-cdr | [extension][count x]               |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

If your system can record more than 100 stations (see ["Capacities"](#) below), the system only displays two pages of extensions (112 per page) at one time. When you enter the add command to add extensions, the system automatically begins after the last administered extensions. If you enter the change command, the system display begins with the first extension. If you enter the change command with an extension number, the system begins the display with that extension.

When you enter the command list intra-switch-cdr <extension> count x, the system lists "x" switch extensions administered for Intra-Switch CDR beginning with the extension specified by <extension>. For example, if you enter "list intra-switch-cdr 81000 count 500," the system displays extension 81000 (if it is administered for Intra-Switch CDR) and the next 500 extensions that are administered for Intra-Switch CDR. The display command functions similarly to the change command.

### Capacities

The Intra-Switch CDR extension capacities vary from switch to switch. See the *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference*.

### Form instructions

---

Make assignments as required for the following fields on each page of the form:

### Page 1 of X of the Add/Change/Display form

- **Assigned Members** — The number of extensions administered out of the switch version maximum. To add the Intra-Switch CDR feature to additional extensions, enter the extension number(s) on this form.

- **Type** — A user-defined description of the extension
- **Name** — A user-defined name associated with the extension

## ISDN-BRI Trunk Circuit Pack

---

This form administers an ISDN-BRI circuit pack. See *DEFINITY ECS System Description Pocket Reference* for information on the maximum number of ISDN-BRI circuit packs that you can administer.

### Administration commands

---

Use the following commands to administer the BRI Trunk Circuit Pack form.

| Action  | Object          | Qualifier <sup>1</sup>  |
|---------|-----------------|-------------------------|
| add     | bri-trunk-board | PPCSS <sup>2</sup>      |
| change  | bri-trunk-board | PPCSS                   |
| display | bri-trunk-board | ['print' or 'schedule'] |
| remove  | bri-trunk-board | PPCSS                   |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.
  2. PP — representing two-digit port network number, C — representing one-digit carrier identification, SS — representing two-digit slot number.

### Form instructions

---

Make assignments, as required, for the following fields on each page of the form.

## Page 1 of the form

```

## Screen 5-82. BRI Trunk Form (using a TN2185 circuit pack)

- **Location** — A display-only field showing the TN2185 circuit pack location (PPCSS)
- **Name** — A 15-character alpha-numeric identification that may be used to identify the circuit pack. Default is blank.
- **Interface Companding** — Indicates the companding algorithm expected by the system at the far end. Valid entries are **a-law** (default) or **mu-law**. Blank is not a valid entry.
- **DCP/Analog Bearer Capability** — Indicates how to encode the Bearer Capability IE for an outgoing call originated by a DCP or analog endpoint. Valid entries are **3.1kHz** (default) or **speech**. Blank is not a valid entry.
- **T3 Timer Length (sec)** — Tells the TE side how long to wait for an inactive Layer 1 to become active. Valid entries are 1 through 127 seconds in increments of 1 second. Default is **15**. Blank is not a valid entry.
- **Port** — A display-only field showing the port number to which parameters administered on the row apply.
- **Interface** — Tells call processing software whether a particular port is connected to a user/network or a peer interface. Valid entries for TN2185 are **network**, **user**, **peer-master**, **peer-slave** (can enter only if the QSIG Basic Call Setup feature is enabled), or blank (default).
- **Side** — Determines how glare conditions are handled when Interface field is peer-slave. Valid entries are **a** and **b**. Blank is not a valid entry.

5 Basic Forms

ISDN-BRI Trunk Circuit Pack

Page 5-188

- **Cntry/Peer Protocol** — Tells call processing software which ISDN protocol standard is applied. Valid entries are **1** through **23**, **etsi**, **QSIG**, or blank (default - however, you cannot leave this field blank if the `Interface` field is set to a valid, non-blank value). When the `Interface` field is **peer-slave** or **peer-master**, this field must be **QSIG**. When this field is **10**, **12**, **13**, or **etsi**, the `Protocol Version` field is equivalent to **b** on the DS1 circuit pack form.

The choice **QSIG** is valid only when `Interface` is **peer-slave**. When **Cntry/Peer Protocol** is set to **10**, **12**, **13**, or **etsi**, set `Provol Version` to **b**. For all other administered values, the `Protocol Version` sets to **a**.

- **TEI** — Valid entries are **auto** and **0** (default).
- **Time Fill** — The bit pattern sent on the D-channel between valid LAPD packets. Valid entries are **flags** and **ones** (default). Blank is not a valid entry.
- **Invert Bits** — Valid entries are **y** and **n** (default). Blank is not a valid entry.
- **Synch Source** — Valid entries are **y** and **n** (default). Blank is not a valid entry.
- **Layer 1 Stable** — Tells call processing and maintenance software whether to expect the network to drop Layer 1 when the BRI port is idle. Valid entries are **n** and **y** (default). Blank is not a valid entry. Only the TN2185 may be set to **n**.
- **Detect Slips** — Tells maintenance software whether slips reported by the BRI port should be logged. Valid entries are **y** and **n** (default). Blank is not a valid entry.

Screen 5-83. BRI Trunk form (with a TN556B or TN2198 circuit pack)

Fields unique to this form

The following fields do not display with a TN556B or TN2198 circuit pack:

- T3 Timer Length (sec)
- Synch Source
- Layer 1 Stable
- Detect Slips

The following field descriptions are unique to the ISDN-BRI Circuit Pack form with a TN556B or TN2198 circuit pack:

- **Interface** — Tells call processing software whether a particular port is connected to a user/network or a peer interface. Valid entries for TN556B are **network**, **peer-master** (can enter only if the QSIG Basic Call Setup feature is enabled), or blank (default).
- **Side** — Determines how glare conditions are handled when Interface field is peer-slave. Valid entries are **a** (default) and **b**. Blank is not a valid entry. This field is not administrable when Interface is **network**.
- **Cntry/Peer Protocol** — Tells call processing software which ISDN protocol standard is applied. Valid entries are **1** through **23**, **etsi**, **QSIG**, or blank (default - however, you cannot leave this field blank if the Interface field is set to a valid, non-blank value). When the Interface

field is **peer-master**, this field must be **QSIG**. When this field is **10, 12, 13**, or **etsi**, the Protocol Version field is equivalent to **b** on the DS1 circuit pack form.

Page 2 of the form

 **NOTE:**  
 If administering a TN2185 circuit pack, 8 ports appear; otherwise, 12 ports appear.

Page 2 of 2

Screen 5-84. BRI Trunk Form - Page 2 (using a TN2185 circuit pack)

 **NOTE:**  
 You cannot change the Endpt Init and SPID port parameters unless that port is busied out or unadministered. It is possible to change all other fields on this page even if the corresponding port is active.

 **NOTE:**  
 If *Interface* on page 1 contains a valid value when the form is submitted, the contents of the fields on page 2 for that port are validated. If *Interface* is blank when the form is submitted, the fields on this page for that port reset to their default values.

- **Port** — A display-only field showing the port number to which parameters administered on the row apply.
- **XID Test** — Indicates whether the far end supports the Layer 2 XID test. Valid entries are **y** and **n** (default). Blank is not a valid entry.

- **Endpt Init** — Indicates whether the far end supports endpoint initialization. Valid entries are **y** and **n** (default). Blank is not a valid entry. If set to **n**, *SPID* and *Endpt ID* must be blank. If set to **y**, *SPID* must be blank. DEFINITY ECS blocks you from changing this field and the *SPID* field unless that port is busied out or unadministered.
- **SPID** — A 12-digit field containing the SPID expected by the far end. Valid entries are any string of 1 to 12 digits with leading zeroes considered significant and not ignored, or blank (default). DEFINITY ECS blocks you from changing this field and the *Endpt Init* field unless that port is busied out or unadministered. The only protocol supported for SPID initialization is Bellcore (Country Code 1). Trunks will not be put in service if SPID installation is not successful.
- **Endpt ID** — A 2-digit field containing the Endpoint Identifier expected by the far end. Valid entries are from **00** to **62** with leading zeroes considered significant and not ignored, or blank (default).
- **Max NCA TSC** — A 2-digit field giving the maximum number of Non-Call-Associated Temporary Signaling Connections allowed on this BRI D-channel. (This field's function is the same as the like-name field on the Signaling Group form.) Valid entries are **0** through **63**. Default is **0**. Blank is not a valid entry.

## Trunk Member Administration

Administer BRI trunk members using the following scheme to address the individual B-channels:

- B-channel 1 uses the port address of the BRI Trunk Port.
- B-channel 2 uses the port address of B-channel 1 incremented by 16.

When adding a BRI trunk to an isdn trunk-group, DEFINITY ECS blocks you from administering a Signaling Group for that trunk member.

DEFINITY ECS blocks you from administering a BRI trunk member if the port has not yet been administered on the BRI Trunk form.

For example, administer the B-channels on a TN2185 circuit pack inserted in slot 01A10 as follows:

| Port | B-channel 1 | B-channel 2 |
|------|-------------|-------------|
| 1    | 01A1001     | 01A1017     |
| 2    | 01A1002     | 01A1018     |
| 3    | 01A1003     | 01A1019     |
| 4    | 01A1004     | 01A1020     |

|   |         |         |
|---|---------|---------|
| 5 | 01A1005 | 01A1021 |
| 6 | 01A1006 | 01A1022 |
| 7 | 01A1007 | 01A1023 |
| 8 | 01A1008 | 01A1024 |

## Interactions

---

The **add bri-trunk board PPCSS** command is rejected if PPCSS identifies a TN556B circuit pack, and a port on that circuit pack has already been assigned to a station or data-module. If a TN556B circuit pack has been administered as a BRI trunk circuit pack, any port on that circuit pack is prevented from being assigned to a station or data-module.

## Language Translations

These forms administer a "user-defined" language for display messages. This allows a user-customized language to be added to the four languages (English, French, Italian, and Spanish) provided with the System.

Only Roman letters, punctuation, and digits are accepted (blanks are also acceptable). Diacritical marks are not supported.

### NOTE:

If "user-defined" is selected for the display language and no translations have been made on these forms, all display messages will appear as a string of asterisks.

### Administration commands

Use the following commands to administer the Language Translations forms.

| Action  | Object                                  | Qualifier <sup>1</sup>  |
|---------|---|-------------------------|

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

### Form instructions

---

Make assignments as required for the following fields on the form:

- **English** — Display-only field. This field contains the English term to be translated.
- **Meaning of English term** — Display-only field. Only appears on certain forms. This field contains a short explanation of the English message if that message is an abbreviation.
- **Translation** — Enter the desired translation for the corresponding English term.

**NOTE:**

In order to provide unique labeling for AD button types as shown in [Screen 5-108](#), the switch will replace the last two characters with digits for the 12-key 8400 and 15-key 8434D voice terminals.

The digits following the “AD” are derived from the button position. If the first button is an AD button, then it is AD1 and the fifteenth button is AD15. All the AD buttons between 1 and 15 have the position number appended to “AD.”

Screen 5-109. Language Translations — Time-Of-Day-Routing form (page 1 of 1)

## Listed Directory Numbers

Allows Direct Inward Dialing (DID) numbers to be treated as public Listed Directory Numbers (LDNs). When one of these numbers is direct inward dialed, the calling party is routed to the attendant. The attendant display indicates a Listed Directory Number call and the name associated with the dialed extension.

### Administration commands

Use the following commands to administer the Listed Directory Numbers form.

| Action  | Object                   | Qualifier <sup>1</sup>  |
|---------|--------------------------|-------------------------|
| change  | listed-directory-numbers | —                       |
| display | listed-directory-numbers | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

### Form instructions

```

                                                                 Page 1 of 2

**Screen 5-111. Listed Directory Numbers form (page 2 of 2)**

Make assignments as required for the following fields on the form:

- **Ext** — Enter a valid unassigned extension number (1 to 5 digits).
- **Name** — Enter a name used to identify the Listed Directory Number. Up to 27 alphanumeric characters may be used.
- **TN** — Enter the Tenant Partition number. Default is 1.
- **Night Destination** — Enter the valid assigned extension number (may be a night service extension, a recorded announcement extension, a Vector Directory Number, an individual attendant extension, or a hunt group extension) that will receive calls to these listed numbers when the System is in the Night Service mode. Enter 1 to 5 digits.

**Implementation note:**

---

The number of Listed Directory Numbers that can be assigned varies depending on System configuration. See the *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference* for maximum values.

## Loudspeaker Paging

---

The Loudspeaker Paging form contains the fields required to assign zone (speaker location) information for Loudspeaker Paging, Loudspeaker Paging — Deluxe, and Code Calling Access.

### Administration commands

---

Use the following commands to administer the Loudspeaker Paging form.

| Action  | Object             | Qualifier <sup>1</sup>  |
|---------|--------------------|-------------------------|
| change  | paging loudspeaker | —                       |
| display | paging loudspeaker | ['print' or 'schedule'] |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ') indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

### Form instructions

---

Make assignments as required for the following fields on each page of the form:

### Page 1 of the Loudspeaker Paging form

```

change paging loudspeaker                                Page 1 of 1

```

Screen 5-112. Loudspeaker Paging form (page 1 of 1)

- **CDR** — Enter **y** (default) to indicate if you want CDR data collection on the paging ports.
- **Voice Paging Timeout (sec)** — Enter from **10** to **600** seconds. This is the length of time the user can be connected to the paging equipment. After the time has elapsed, the call is disconnected. Analyze the typical messages you expect to broadcast; time them; then add another 4 to 5 seconds.
- **Code Calling Playing Cycles** — Enter a number from **1** to **3** to indicate the number of times the code calling identification will play. Analyze who your code calling users are and whether they are likely to hear the code chime the first time.
- **Port** — Enter seven characters.

The entry breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 22 |
|            |                | 01 through 03 |
|            |                | 01 (G3s)      |

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 3          | Carrier        | A through E   |
| 4-5        | Slot Number    | 01 through 20 |
| 6-7        | Circuit Number | 01 through 32 |

 **NOTE:**

When using Administration Without Hardware, place an "X" in this field to indicate that there is no hardware associated with this port assignment.

Each assigned paging zone requires a port on a TN763 Auxiliary Line circuit pack.

If a port is not assigned to a zone, then the CDR, Voice Paging Timeout, and Code Calling Playing Cycles will be set to the System default values when the System is administered.

- **Voice Paging — TAC** — Enter a 1- to 4-digit Trunk Access Code (TAC) that corresponds with the Dial Plan Record. One TAC must be assigned for each zone. This is the code you will dial to access the zone (the physical location of the loudspeakers). The TAC for the field labeled ALL activates all speakers in the nine zones when that access code is dialed. These codes can be assigned to Abbreviated Dialing feature buttons on user stations or to the DTGS buttons on the attendant consoles for easy activation by attendants. A different TAC must be assigned for each paging zone.
- **Voice Paging — COR** — Enter the desired number from **0** through **95**. Each TAC must be assigned a class of restriction (COR) that reflects the desired restriction for Loudspeaker Paging.
- **Voice Paging — TN** — Enter the Tenant Partition number. Default is **1**.
- **Code Calling — TAC** — Enter a 1- to 4-digit TAC that corresponds with the Dial Plan Record. These codes can be assigned to Abbreviated Dialing feature buttons on user stations or to the DTGS buttons on the attendant console for direct access to the zone by the attendant. A different TAC must be assigned for each paging zone.
- **Code Calling — COR** — Enter the desired number from **0** through **95**. Each TAC must be assigned a class of restriction (COR) that reflects the desired restriction for Code Calling.
- **Code Calling — TN** — Enter the Tenant Partition number. Default is **1**.
- **Location** — Enter the location where the loudspeakers are installed (such as conference room A, warehouse, storeroom). Default is PAGING.

## Maintenance-Related System Parameters

---

This form establishes parameters associated with system maintenance.

### Administration commands

---

Use the following commands to administer this form. In some cases, just the most commonly used commands are shown. See [Appendix B, "Administration Commands"](#), for a complete listing of all administration commands, the command structure, and the use of abbreviated command words when entering a command.

| Action  | Object                        | Qualifier <sup>1</sup>  |
|---------|-------------------------------|-------------------------|
| change  | system-parameters maintenance | —                       |
| display | system-parameters maintenance | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

### Form instructions

---

Use this form to specify and display scheduled maintenance operations and maintenance support functions. This form can also be used to activate and deactivate INADS alarm origination when performing repairs.

The following pages describe the fields on this form. For more information on any of the maintenance parameters, see the Maintenance manual for your DEFINITY ECS.

Page 1 of the form

```

Page 1 of X

  Control Channel Interchange: no      System Clocks Interchange: no
  SPE Interchange: no

```

Screen 5-113. Maintenance-Related System Parameters form (page 1 of 2)

Operations Support Parameters

- **Product Identification** — A 10-digit number starting with 1 that identifies the switch to an Operations Support System (OSS), for example, INADS.
- **First OSS Telephone Number** — The first telephone number the switch uses to report alarms to, for example, INADS or Trouble Tracker. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. # and \* are not allowed in the telephone number.
- **Abbrev Alarm Report** — Enables the Abbreviated Alarm Report feature for the first OSS. Default is **y**.
- **Second OSS Telephone Number** — The second telephone number that the switch uses to report alarms to, for example, INADS or Definity SNMP. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. # and \* are not allowed in the telephone number.
- **Abbrev Alarm Report** — Enables the Abbreviated Alarm Report feature for the second OSS. Default is **n**.

- **Alarm Origination to OSS Numbers** — Indicates one of four options for alarm origination. If this field is set to anything other than **neither** (default), the craft login has a 30-minute inactivity timeout.
  - If **both**, all Major and Minor alarms result in an automatic call to both OSS telephone numbers. Both OSS telephone numbers must be administered.
  - If **first-only**, all Major and Minor alarms result in an automatic call to the first OSS number only. The switch does not call the second OSS telephone number even if the number is administered. The first OSS telephone number must be administered.
  - If **neither**, alarm origination does not take place. Warning alarms are not reported to either numbers.
  - If **second-as-backup**, all Major and Minor alarms result in an automatic call to the first OSS telephone number. If calling the first OSS telephone number fails four attempts, the switch starts to call the second OSS telephone number as a backup until calling the first OSS telephone number becomes successful. Both OSS telephone numbers must be administered.
- **Cleared Alarm Notification** — Enables the switch to originate a call to the OSS and send an alarm resolution message whenever all previously reported Major and Minor alarms are resolved. Alarm Origination must be activated in order for Cleared Alarm Notification to work. Default is **n**.
- **Restart Notification** — Enables the switch to originate a call to the OSS and report any system restarts caused by problems with the switch.
- **Test Remote Access Port** — Specifies whether testing of the remote access port on the SYSAM circuit pack is enabled. This field should be set to **y** whenever there is an INADS line connected to the switch and there is a maintenance contract in effect so that alarm origination capability is maintained.

If no equipment is connected to the remote access port, or if a trunk for remote access and alarm origination is not provided, running tests on the remote access port on the SYSAM results in test failures. This causes unnecessary maintenance alarms and allows potentially destructive tests to be run. Setting this field to **n** (default) prevents this.
- **CPE Alarm Activation Level** — Indicates the minimum level (Major, Minor or Warning) at which the Customer-Provided Equipment (CPE) alarm is activated. If the level is **none**, **1**.

The CPE does is not activated for any alarm. Default is **none**.

 **NOTE:**

The CPE alarm is always activated when the switch goes into Emergency Transfer, regardless of the CPE Alarm Activation Level setting.

- **Packet Bus Activated** — This field appears only for R5vs/si and later configurations. This field must be **y** for ISDN over PACCON to work.
- **Customer Access to INADS Port** — Provides the capability to prohibit access to system administration and maintenance interface, via the INADS port when using customer login ID's. This field can only be activated by Lucent Technologies services through system-parameters maintenance administration. Default is **n**.

## Scheduled Maintenance

A series of maintenance tests and operations runs automatically every day according to the schedule and settings specified in the following fields:

- **Start Time** — The hour and minute in 24-hour notation at which daily scheduled maintenance will begin running. Default is **22:00**.
- **Stop Time** — The hour and minute when scheduled daily maintenance will stop running. If any daily maintenance operations are not completed by this time, the system will note where in the sequence it stopped and perform those operations during the next scheduled daily maintenance.
- **Daily Maintenance** — This display-only field simply represents the series of tests that are always run by maintenance software as part of daily maintenance.
- **Save Translation** — Indicates on which days translation data in memory will be saved automatically to the Mass Storage System disk and/or tape devices during scheduled maintenance. The save operation is first made to disk, followed by a disk backup to tape. On systems with duplicated SPEs, translation data is saved on both SPEs. Valid entries are **daily** (default), days of the week, or **n**. **N** specifies that no automatic saves are to be executed.
- **Control Channel Interchange** — Each port network has a pair of TDM busses called A and B, each of which has a set of time slots dedicated to use by the control channel. At any one time, the control channel in each PN is carried on only one of the two busses. This field indicates which days the control channel in each port network will be switched from one of the paired TDM busses to the other. Valid entries are **daily**, days of the week, or **n** (default). **N** specifies that no interchange be executed.
- **System Clocks Interchange** — On High and Critical Reliability systems, this option causes a Tone-Clock interchange in each port network with duplicated Tone-Clock circuit packs. Each port network interchanges into the standby Tone-Clock for 20 seconds and then back to the Tone-Clock that was originally active. This field indicates on which days the interchanges are to take place. Valid entries are **daily**, days of the week, or **n** (default). **N** specifies that interchanges be executed.

5 Basic Forms

Maintenance-Related System Parameters

The system performs a Tone-Clock interchange, making the stand by Tone-Clock active. The newly active Tone-Clock circuit pack is tested and, while active, provides system clocks for the port network in which it resides. The system then interchanges back to the originally active Tone-Clock circuit pack.

- **SPE Interchange** — On systems with duplicated SPEs, this field indicates on which days an SPE interchange will be executed during scheduled maintenance. Valid entries are **daily**, days of the week, or **n** (default). **N** specifies no scheduled interchanges.

Screen 5-114. Maintenance-Related System Parameters form (page 2 of 2)

- **TTRs** — When the number of touch tone receivers (TTRs) in service falls below this number (4 to 200), a WARNING alarm is raised against TTR-LEV. These are also known as dual-tone multifrequency receivers (DTMRs). There are 4 TTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a TTR being taken out of service, set to 4 times the number of TN748s. If this number is set to more than three less than the total number of TTRs, a port network with only one TN748 could lose all of its TTRs before this alarm is raised.
- **CPTRs** — When the number of call progress tone receivers in service falls below this number (2 to 100), a WARNING alarm is raised against TTR-LEV. These are also known as general purpose tone detectors (GPTDs). There are 2 CPTRs on each TN748 Tone Detector circuit pack,

and up to 50 TN748s in a system. To alarm the first occurrence of a CPTR being taken out of service, set to 2 times the number of TN748s. If this number is set to more than one less than the total number of TTRs, a port network with only one TN748 could lose all of its CPTRs before this alarm is raised.

- **Call Classifier Ports** — When the number of call classifier ports (CLSFY-PTs) in service falls below this number, a WARNING alarm is raised against TTR-LEV. Valid entries are 1 to 200. There are 8 ports on each TN744 Call Classifier circuit pack, and up to 25 TN744s in a system. To alarm the first occurrence of a CLSFY-PT being taken out of service, set this field to 8 times the number of TN744s. If this number is more than 7 less than the total number of CLSFY-PTs in the system, a port network with only one TN744 could lose all of its CLSFY-PTS before the alarm is raised. If there are no TN744s in the system, leave this field blank.
- **MMIs** — The minimum number of ports on Multimedia Interface circuit packs. Only valid if MMCH is enabled. Valid values are **1–128**.
- **VCs** — The minimum number of ports on Voice Conditioner circuit packs. Only valid if MMCH is enabled. Valid values are **1–126**.
- **Test Type 100, Test Type 102, Test Type 105** — An extension assigned to receive tie-trunk calls from other switches with test line origination capability. The system responds by sending a sequence of test tones.
  - Test Type 100 tests far end to near end loss and C-message.
  - Test Type 102 tests far end to near end loss.
  - Test Type 105 tests 2-way loss, gain slope, and C-message and C-notch noise.
- **ISDN-PRI Test Call Extension** — The extension used by a far-end ISDN node to place a call to the system to test the ISDN-PRI trunks between the far-end and the system.
- **ISDN-BRI Service SPID** — Shows whether the link is associated with the Service SPID. If the link is associated with the Service SPID, the field contains a number from **0** to **99999**. This number is the test SPID — otherwise, this field is blank. Service SPID is a feature used by the system technician to check building wiring between the switch and the BRI endpoint.
- **DSO Loop-Around Test Call Extension** — The extension used by the network service provider to set up a DSO loop around connection for testing non ISDN DS1 trunks.

This feature is used primarily for testing DSO channels associated with non ISDN-PRI trunks. The loop-around is activated by dialing the test extension number. Multiple DSO Loop-Around connections can be set up by placing multiple calls to the loop-around extension.

For more information see the information about Facility Test Calls in the maintenance manual for your system.

- **Loss Plan** — Use only when extra loss is required to maintain quality of transmission on conference calls. Leave this field blank if no extra loss is required. If extra loss is required, enter digits as shown below.

| No. Of Parties To Be Conferenced | Enter Digit |
|----------------------------------|-------------|
| 3                                | 2           |
| 4                                | 3           |
| 5                                | 4           |
| 6                                | 5           |
| 7                                | 6           |

- **SPE Optional Boards** — These fields indicate whether a Disk circuit pack is present in the system, and which Packet Interface slots are administered. If a Packet Interface circuit pack is physically present, the corresponding `Packet Interface` field is set to **y** when the system boots, and no change to that field is allowed. If the system is equipped with duplicated SPEs, a `Packet Interface` field is set to **y** when either SPE carrier contains a Packet Interface circuit pack in the corresponding position. If a Packet Interface circuit pack is not present, then the value for the `Packet Interface` field is read from translation data stored on disk or tape. If the field is **n**, a Packet Interface circuit pack may be administered by changing the corresponding `Packet Interface` field to **y**.

      MAINTENANCE-RELATED SYSTEM PARAMETERS

Modem Connection: none
      Data Bits: 8
      Parity: None

external      none
```

Screen 5-115. Maintenance-Related System Parameters form (page 3 of 3)

- **Modem Connection** — Indicates the type of modem connection. Values for vs/si are **internal**, **external** or **none**. Values for csi are **external** or **none**. This value cannot be “**none**” if Alarm Origination to OSS Numbers is enabled.
- **Data Bits** — The number of data bits, either **7** or **8**.
- **Parity** — A display only field. Value is none.

## Mode Code Related System Parameters

---

This form establishes parameters associated with the Mode Code Voice Mail System Interface.

### Administration commands

---

Use the following commands to administer the Mode Code Related System Parameters form. In some cases, just the most commonly used commands are shown. See [Appendix B, "Administration Commands"](#) for a complete listing of all administration commands, the command structure, and the use of abbreviated command words when entering a command.

| Action  | Object                      | Qualifier <sup>1</sup> |
|---------|-----------------------------|------------------------|
| change  | system-parameters mode-code | —                      |
| display | system-parameters mode-code | ['print' ]             |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

### Form instructions

---

Use the Mode Code Related System Parameters form to specify and display mode codes and administer the duration and interval of touch tones sent from the switch to the voice mail system (VMS). Mode codes are the touch tones that the switch sends to the VMS to indicate the type of call (for example, internal caller, external caller, call coming from coverage) that is accessing the voice mail system.

The following pages describe the fields on the Mode Code Related System Parameters form.

#### NOTE:

You should first check `Mode Code Interface` on the System Parameters Customer Options form. This field must be set to `y`.

## Page 1 of the form

```

                                                                 Page 1
                MODE CODE RELATED SYSTEM PARAMETERS

MODE CODES (FROM SWITCH TO VMS)

VMS Hunt Group Extension : _____
```

### Screen 5-116. Mode Code Related System Parameters form

#### Mode Code Parameters

- **Direct Inside Access** — This is a value of up to six digits that may include #, \*, or 0 to 9. A blank field is valid and the default is #00. This value defines a mode code that the switch sends when a caller at an internal extension dials the VMS access number.
- **Direct Dial Access - Trunk** — This is a value of up to six digits that may include #, \*, or 0 to 9. A blank field is valid and the default is #01. This value defines a mode code that the switch sends when an external caller dials the VMS access number.
- **Internal Coverage** — This is a value of up to six digits that may include #, \*, or 0 to 9. A blank field is valid and the default is #02. This value defines a mode code that the switch sends when an internal caller tries to reach a user at another extension and the call goes to the user's voice mail coverage.
- **External Coverage** — This is a value of up to six digits that may include #, \*, or 0 to 9. A blank field is valid and the default is #03. This value defines a mode code that the switch sends when an external caller tries to reach a user at another extension and the call goes to the user's voice mail coverage.

## 5 Basic Forms

### *Mode Code Related System Parameters*

Page 5-222

- **System In Day Service** — This is a value of up to six digits that may include #, \*, or 0 to 9. A blank field is allowed and the default is #11. This value indicates to the VMS that the DEFINITY ECS has changed from Night to Day Service.
- **System In Night Service** — This is a value of up to six digits that may include #, \*, or 0 to 9. A blank field is allowed and the default is #12. This value indicates to the VMS that the DEFINITY ECS has changed from Day to Night Service.

### Other Related Parameters

- **DTMF DURATION ON** — This value must be a multiple of 25 and can be between 75 and 500 milliseconds. This field cannot be blank. Default is 100 milliseconds. This value defines the length, in milliseconds, of mode code digits sent to the VMS.
- **OFF** — This value must be a multiple of 25 and can be between 75 and 200 milliseconds. This field cannot be blank. Default is 100 milliseconds. This value defines the interdigit interval, or pause, between mode code digits as they are sent to the VMS.
- **Sending Delay** — This value must be a multiple of 25 and can be between 75 and 1000 milliseconds. This field cannot be blank. Default is 100 milliseconds. This value defines the delay between the time the switch receives answer supervision from the VMS and the time the first mode code digit is sent.
- **VMS Hunt Group Extension** — This field should contain the extension of a hunt group containing VMI extensions. A check is made to verify that a valid hunt group extension is entered, but a check is not made to verify that the hunt group members are VMI extensions. A blank field is allowed or the field can be administered to any assigned hunt group extension within the switch.

## Modem Pool Group

---

There are two types of conversion resources for Modem Pooling. The first type, an *integrated conversion resource*, is a circuit pack that emulates a Trunk Data Module connected to a 212A-type modem. Two conversion resources are on each circuit pack.

The second type, a *combined conversion resource*, is a separate Trunk Data Module and modem administered as a unit. The Trunk Data Module component of the conversion resource may be either a Modular Trunk Data Module (MTDM) or 7400A Data Module and connects to a digital port using Digital Communications Protocol (DCP); the modem connects to an analog port.

### Administration commands

---

Use the following commands to administer the Modem Pool Group form.

| Action  | Object         | Qualifier <sup>1</sup>          |
|---------|----------------|---------------------------------|
| add     | modem-pool num | [1-MAX]                         |
| change  | modem-pool num | [1-MAX]                         |
| display | modem-pool num | [1-MAX] ['print' or 'schedule'] |
| list    | modem-pool num | ['print' or 'remove']           |
| remove  | modem-pool num | [1-MAX]                         |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the maximum number available in your system configuration.

Screen 5-118. Modem Pool Group — Combined form (page 1 of 1)

## Implementation note

---

Page 1 when `Group Type` is **combined**.

Make assignments as required for the following fields on the form:

- **Group Number** — Enter a group number when completing a paper form. This is a display-only field when the form is accessed using an administration command such as **add** or **change**.
- **Group Type** — Enter **integrated** or **combined**.
- **Receiver Responds to Remote Loop** — Enter **y** to allow far-end modem to put conversion resource into loop back mode. Default is **n**. (This field displays only when `Group Type` is **integrated**.)
- **Hold Time (min)** — Enter the maximum number of minutes (**1** through **99**) that a conversion resource in the group may be held while a call waits in a queue or reserved after Data Call Preindication. Default is **5**.
- **Send Space Disconnect** — Enter **y** (default) to allow the conversion resource to send 4 seconds of space before disconnecting. (This field displays only when `Group Type` is **integrated**.)
- **Receive Space Disconnect** — Enter **y** (default) to allow the conversion resource to disconnect after receiving 1.6 seconds of space. (This field displays only when `Group Type` is **integrated**.)
- **CF-CB Common** — Enter **y** (default) to indicate that the CF and CB leads on the conversion resource are logically connected. (This field displays only when `Group Type` is **integrated**.)
- **Loss of Carrier Disconnect** — Enter **y** (default) to permit conversion resource to disconnect if it detects a dropped carrier. (This field displays only when `Group Type` is **integrated**.)
- **Modem Name** — Enter a 1- to 6-alphanumeric character string to indicate the name of the modem pool. (This field displays only when `Group Type` is **combined**.)
- **Time Delay** — Enter the time delay in seconds (**0** through **255**) to insert between sending the ringing to the modem and the off-hook alert to the data module. Default is **0**. (This field displays only when `Group Type` is **combined**.)
- **Direction** — Enter the direction (**incoming**, **outgoing** or **two-way**) of the call for which modem pool will operate. Default is **two-way**. (This field displays only when `Group Type` is **combined**.)

The following fields (`Speed`, `Duplex`, and `Synchronization`) cannot be filled out for the "integrated" pooled modem forms but can be assigned on the "combined" pooled modem form. The integrated conversion resource will automatically adjust its speed and synchronization to the endpoint it is connected to. In synchronous mode, the integrated modem pool can operate at

1200 baud. In asynchronous mode, it can operate at 300 or 1200 baud. Full-duplex operation is always used.

- **Speed** — Enter the communication speed in bits per second (LOW — 0 to 300 blind sampled, **300, 1200, 2400, 4800, 9600, or 19200**) of the conversion resources in the group. Enter one to three speeds separated by slashes (for example, 300/1200/2400) to indicate a maximum of three running speeds. Default is **LOW/300/1200**.
- **Duplex** — Enter **full** (default) or **half** to indicate the duplex mode of the conversion resources in the group.
- **Synchronization** — Enter **sync** or **async** (default) to indicate the synchronization mode of the conversion resources in the group.

**CIRCUIT PACK ASSIGNMENTS** are optional on "integrated" conversion resource forms only.

- **Circuit Pack Location** — Enter the port associated with the conversion resource on the integrated modem pool circuit pack. Enter seven characters.

The entry breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 22 |
|            |                | 01 through 03 |
|            |                | 01 (G3s)      |
| 3          | Carrier        | A through E   |
| 4-5        | Slot Number    | 01 through 20 |
| 6-7        | Circuit Number | 01 through 32 |

**PORT PAIR ASSIGNMENTS** are optional on "combined" pooled modem forms only.

- **Analog Digital** — Enter the port numbers of the modem/TDM pair in a conversion resource. Enter seven characters.

The entry breaks down as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 22 |
|            |                | 01 through 03 |
|            |                | 01 (G3s)      |

| <b>Characters</b> | <b>Meaning</b> | <b>Value</b>  |
|-------------------|----------------|---------------|
| 3                 | Carrier        | A through E   |
| 4-5               | Slot Number    | 01 through 20 |
| 6-7               | Circuit Number | 01 through 32 |

 **NOTE:**  
Two port entries are required.

## Multifrequency-Signaling-Related System Parameters

This form sets the system parameters associated with multifrequency signaling.

### Administration commands

Use the following commands to administer the Multifrequency-Signaling-Related System Parameters form.

| Action  | Object                                     | Qualifier <sup>1</sup>  |
|---------|--|-------------------------|
| change  | system-parameters multifrequency-signaling |                         |
| display | system-parameters multifrequency-signaling | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

Screen 5-120. Multifrequency-Signaling-Related System Parameters form (page 1 of 4)

## Implementation notes

[Screen 5-120](#) appears when both Incoming Call Type and Outgoing Call Type are **group-ii-mfc**.

The ANI Prefix, ANI for PBX, and Collect All Digits Before Seizure fields appear only when the value of the Outgoing Call Type field is **group-ii-mfc** or **mfe**.

If Collect All Digits Before Seizure is **y**, Overlap Sending on Link-to-Link Tandem Calls and Convert First Digit End-of-ANI are not displayed.

- **Incoming Call Type** — Enter **group-ii-mfc** (default), **non-group-ii-mfc**, or **mfe** (multi-frequency Espanol, used only in Spain). This field defines the signal type that a CO uses to place an incoming call to the PBX.

If the value of this field is **group-ii-mfc**, the second page of the form will display entries for all group-I, group-II, group-A, and group-B signal types with a set of default values (see page 2 of form). If the value is **non-group-ii-mfc**, the second page displays only group-I and group-A signal types.

- **Outgoing Call Type** — Enter **group-ii-mfc**, **none** (default), or **mfe** (multi-frequency Espanol, used only in Spain). This field defines the signal type that the PBX uses to place an outgoing call into a CO.

If the content of this field is **group-ii-mfc**, the system displays the third page of the form. The third page displays entries for all group-I, group-II group-A, and group-B signal types with a set of default values. If the content of this field is **none**, the system does not display the third page. In addition, *Outgoing Forward Signal Present Timer*, *Outgoing Forward Signal Absent Timer*, *ANI Prefix*, *ANI for PBX*, *Next ANI Digits*, and *Collect All Digits Before Seizure* will not display on page 1 of the form.

- **MFE Type** — Enter **2/5** (default) or **2/6** to determine which public signaling the switch will use. The field only appears when *Incoming Call Type* is **mfe** and the *Outgoing Call Type* is **mfe** or **none**.
- **Maintenance Call Type** — Enter **1**, **2**, or **none** (default) to indicate which maintenance test is indicated when the CO sends an MFC maintenance tone. Currently, **1** indicates the Belgium maintenance sequence, and **2** indicates the Saudi Arabian sequence.
- **Test Call Extension** — Enter an unassigned extension to specify the destination of a call between the CO and the PBX that tests R2-MFC signaling. A test call extension is used when the call type is **1**. Default is blank.
- **Interdigit Timer (sec)** — Enter a number between **1** and **255** to specify the maximum number of seconds the switch will wait for the first forward signal (digit) to arrive, and for subsequent expected digits to arrive. Intercept returns to the calling party if this timer expires. Default is **10**.

 **NOTE:**

Make sure the number of seconds entered in this field is less than the number of seconds entered in the short interdigit timer.

- **Maximum Resend Requests** — Enter **1–99** (or blank) to indicate the threshold number of resend type MFC signals DEFINITY ECS will accept during an outgoing call or blank. **1** means the call is dropped if one resend signal is received and blank means there is an unlimited number of resend requests allowed. Default is blank.
- **Outgoing Forward Signal Present Timer (sec)** — Enter a number between **1** and **255** to specify the maximum number of seconds to elapse between signals on a call. This timer runs when MFC tones are being sent or received on an outgoing call. The timer starts (and restarts) timing when

the PBX begins sending a forward signal, and stops timing when the PBX receives the corresponding backward signal. This field displays only when the value of `Outgoing Call Type` is **group-ii-mfc**. Default is **15**.

- **Outgoing Forward Signal Absent Timer (sec)** — Enter a number between **11** and **255** to indicate the maximum number of seconds to elapse between forward signals on outgoing calls. The timer starts (and restarts) when a forward tone is taken off the link and it stops when the next forward tone is applied to the link. This field displays only when the content of `Outgoing Call Type` is **group-ii-mfc**. Default is **30**.
- **Multifrequency Signaling Incoming Intercept Treatment** — Enter **y** (default) or **n** to indicate whether a group B "intercept" message is sent to the CO. If the value of this field is **n**, then the normal DID/TIE/ISDN intercept treatment is applied. If the value is **y**, then the group B signal for the intercept is sent to the CO, and the intercept tone plays on the trunk.
- **Overlap Sending on Link-to-Link Tandem Calls** — Enter **y** or **n** (default) to enable overlap sending on link-to-link tandem calls. If **y**, DEFINITY ECS sends and receives digits one digit at a time instead of enbloc. (With enbloc, digits are not sent until the entire group of digits is received).

**NOTE:**

A DEFINITY ECS with this field set to **y** when tandeming calls between switches will send ANI for PBX to the terminating switch if that switch requests ANI before the DEFINITY ECS receives it from the originating switch. The terminating switch may request ANI before the receipt of the last address digit if it is not a DEFINITY ECS or it is a DEFINITY ECS with the `Request Call Category` at `Start of Call` field set to **y**.

- **Private Group II Permissions and Public Interworking? y/n** — Enter **y** or **n** (default). If **y**, DEFINITY ECS:
  - Sends the Category for MFC ANI for the COR of the originating party for non-private-MFC-trunk to MFC-private-trunk calls
  - Sends the Group II category received over the incoming private trunk as the outgoing Group II category on tandem private MFC calls
  - Applies MFC group II-CPC termination restrictions on incoming MFC private trunk calls.
  - Checks station permissions if you call forward off-net.
- **Convert First Digit End-of-ANI To** — Enter any digit **0–9** or blank (default) to specify to what the digit an incoming initial end-of-ani or end-of-dial MF signal should be converted. Administer on a per-switch basis.

- **Received Signal Gain (-Loss) (dB)** — Enter a number between **-15** and **3** to specify the loss/gain when the MFC port listens to the trunk port. Default is **0**. Currently listens with a range of -5 to -35; this value moves the range (for example, a value of -5 provides a range of -10 to -40).
- **Transmitted Signal Gain (-Loss) (dB)** — Enter a number between **-15** and **3** to specify the loss/gain when the trunk port listens to the MFC port. Default is **-3**. The MFC port currently generates at -5 for MFC and -8 for MFE; this field adds gain or loss to the starting value of -5.
- **ANI Prefix** — Enter between one and six digits to define the prefix to apply to an extension number when ANI is sent to the CO. This field appears only when *Outgoing Call Type* is **group-ii-mfc** or **mfe**. Default is blank.
- **ANI for PBX** — Enter a number from **2** to **15** to define the PBX identification number that is sent to the CO when ANI is requested (by the CO) on a particular call but is not available, such as tandem tie trunk calls. This field appears only when *Outgoing Call Type* is **group-ii-mfc**. Default is blank.
- **Next ANI Digit** — This field appears when *Outgoing Call Type* is **group-ii-mfc**. Valid input is **next-digit**, **next\_ani\_digit**, and **send-ani** (default). This field determines whether the Next ANI Digit signal will be the same as the "send-ani" signal or the "next-digit" signal or another signal defines as "next\_ani\_digit."
- **Collect All Digits Before Seizure** — Enter **y** or **n** (default) to determine whether the system collects all the digits before seizing the trunk. This field appears only when *Outgoing Call Type* is **group-ii-mfc** or **mfe**.

**NOTE:**

If the following field is **y**, the *ANI Req* field on the AAR and ARS Digit Conversion Table does not apply. To control ANI collection via the ARS forms, set to **n**.

- **Request Incoming ANI (non-AAR/ARS)** — Enter **y** or **n** (default) to determine whether ANI should be requested on incoming R2-MFC calls. This field only applies if the incoming call via the R2-MFC trunk is terminating to a local station on this PBX.

**NOTE:**

The following three fields appear only if *Incoming Call Type* is **mfe** and *Outgoing Call Type* is **mfe** or **none**.

- **Forward Cycle Timer (sec)** — Enter a number from **1** to **255** to determine how many seconds to wait to receive the check frequency after sending an MFE signal. Default is **5**.
- **Backward Cycle Timer (sec)** — Enter a number from **1** to **255** to determine how many seconds to wait to send the check frequency after receiving an MFE signal. Default is **5**.

- **Income Dial Timer (sec)** — Enter a number between **45 - 255** to determine how long to wait from the start of a call until the end of the check frequency of the last signal. Default is **90**.
- **Outgoing Start Timer (sec)** — Enter a number from **1 to 255** to indicate how long to time from seizure until the beginning of the first Group A signal from the receiving end, and from the end of the check frequency until the beginning receipt of the first digit following the Group II signal. The field appears only if Incoming Call Type and Outgoing Call Types are both "mfe".
- **Called Party Category** — Enter "user-type" (default) or "call-type" to determine which type of group II signals should be used on the outgoing R2-MFC call.
- **Use COR for Calling Party Category** — Enter **y** or **n** (default) to indicate what category should be sent with ANI if requested on an outgoing R2-MFC call. If you enter **y**, the category translated for the calling facility's COR is used. If you enter **n**, the category is determined based on the calling party's user-type.

| ANI Not Available: | ___      | ___      |

Screen 5-121. Multifrequency-Signaling-Related Parameters form (page 2 of 4)

Implementation notes

Previously, the user administered ANI Available and ANI-Not-Available as Group I forward signals in the range of 11-15. Now these signals range from 1 to 15. If ANI Available or ANI-Not-Available is administered in both places, the following error messages should be generated when the user submits the data:

- Error: ANI available signal must be administered only once.

- Error: ANI not available signal must be administered only once.

Either ANI for PBX or ANI-Not-Available signal must be set. If the ANI for PBX field is blank (used for the tandeming cases), then the ANI-Not-Available signal field must be set. If one of these conditions is not set, the following error message generates:

- Error: ANI for PBX or outgoing ANI Not Available signal must be defined.

Currently end-of-ani or end-of-digits must be set. Now, either one of them or Number of Outgoing ANI Digits must be defined or the user receives the following error message:

- End-of-ani, end-of-digits or Number of Outgoing ANI Digits must be defined.

The values for ANI available and ANI-Not-Available must be different or the user receives the following message:

ANI-Available and ANI-Not-Available signal values must be different.

The fields shown on Page 2 define call category and ANI information.

- **Request Call Category at Start of Call**— Enter **y** or **n** (default) to indicate that the Send-ANI backward signal requesting for the caller-category information will be sequenced differently in the MFC signaling flow.

The Caller-category Request backward signal is disjointed from the ANI request. If this field is **y**, the Send-ANI backward signal corresponds exclusively to the caller-category request. In response to this signal, DEFINITY ECS sends a forward signal containing the caller-category information on outgoing calls. On incoming calls, DEFINITY ECS sends the Send-ANI backward signal upon receipt of the first address signal.

- **Restart ANI from Caller Category?** — Enter **y** (default) or **n** to enable DEFINITY ECS to send the caller-category signal later again when the signals for Caller-Category and ANI requests are the same and this signal is received after the Next-Digit forward signals have been received.
- **Number of Incoming ANI Digits** — Enter a number from **0** to **15** to administer the number of ANI digits for incoming MFC calls. Default is **0**.
- **Number of Outgoing ANI Digits** — Enter a number from **0** to **15** to administer the number of ANI digits for outgoing MFC calls. Default is **0**.

DEFINITY ECS appends ANI-Not-Available digits to ANI digits if the actual ANI length is less than the value administered in this field.

**Truncate station number in ANI** — This field defines the side of the extension number to truncate from when station ANI is sent to the CO. *The ANI prefix (either MFC or COR) is not truncated. There is no effect if ANI for PBX is sent.* Valid entries are **beginning**, **ending**, and **no** (default).

- **ANI Available** — Enter a number from **1** to **15** to define the incoming and outgoing ANI-Available signals. Default is blank.
- **ANI Not Available** — Enter a number from **1** to **15** to define the incoming and outgoing ANI-Not-Available signals. Default is blank.

 **NOTE:**

On incoming calls, when the ANI-Not-Available forward signal is received, DEFINITY ECS responds with the End-of-Dial backward signal. If the ANI-Available forward signal is received, the subsequent backward signal to collect the remaining ANI digits is Next ANI.

On outgoing calls, whenever ANI is possible, DEFINITY ECS outputs the ANI-Available forward signal to the CO confirming that ANI is available. Conversely, if ANI is not possible, DEFINITY ECS outputs the ANI-Not-Available forward signal to the CO.

|  | 15: normal | __:   | __:           |

**Implementation note**

[Screen 5-122](#) shows the defaults when the Incoming Call Type field is **group-ii-mfc**. A variation of the above appears if Incoming Call Type is equal to **non-group-ii-mfc**. In addition, when Incoming Call Type is **non-group-ii-mfc**, group II and group B columns are not displayed.

The fields shown on Page 3 define the meaning of MFC tones for calls originated at the CO. See [“Definitions of Group I, II, A, and B signals” on page 5-237](#).

When the form initially appears, either of two sets of default values is possible. One set is for the group II call type; the other set is for non-group II call type. In each set, the default value for each field is set to the most common value.

- **Tones from CO on Incoming Forward Calls — Group I** — Message codes 11 to 15 display. (Numbers 1 through 10 are assigned to the digits of the destination telephone number.) Assign a meaning to each code. If Incoming Call Type is **group-ii-mfc**, acceptable meanings are **drop**, **ani-avail**, **end-of-ani**, **end-of-dial**, **ignored**, **maint-call**, **ani-not-avail**, and **send-congest**. If the Incoming Call Type is **non-group-ii-mfc**, acceptable meanings are **drop** and **ignored**.

| __: _____                                      | __: _____    | 15: congestion                                    | 15: congestion |

This page only appears if *Outgoing Call Type* is **group-ii-mfc** or **mfe**. The fields shown on this page define the meaning of MFC tones for calls originated at the PBX. [See “Definitions of Group I, II, A, and B signals” on page 5-237.](#)

- **Tones to CO on Outgoing Forward Calls — Group I** — Enter numbers between **11** and **15** to identify the message codes. (Numbers 1 through 10 are assigned to the digits of the destination telephone number.) Then assign a meaning to each code. Acceptable meanings are **end-of-digits**, **ani-avail**, **end-of-ani**, and **ani-not-avail**.
- **Tones to CO on Outgoing Forward Calls — Group II** — Enter numbers between **1** and **15** to identify the message codes. Then assign a meaning to each code. Acceptable meanings are **attendant**, **data-call**, **toll-auto**, and **normal**. Each or these can only appear once in the group II column.
- **Tones from CO on Outgoing Backward Calls — Group A** — Message codes between 1 and 15 display. Assign a meaning to each code. Acceptable meanings are **send-ani**, **congestion**, **drop**, **end-of-dial**, **last-2-digits**, **last-3-digits**, **last-digit**, **next-digit**, **restart**, **intercept**, **resend-digit**, and **setup-sppath**.
- **Tones from CO on Outgoing Backward Calls — Group B** — Message codes between 1 and 15 display. Then assign a meaning to each code. Acceptable meanings are **busy**, **congestion**, **free**, **tie-free**, and **intercept**.

## Definitions of Group I, II, A, and B signals

### Group I signals

Group I signals are a basic set of forward signals generated by the originating switch, as follows:

#### **ani-avail**

If this signal is defined and ANI is requested on outgoing R2-MFC calls, ANI is sent to the CO before ANI caller digits are sent. Note that this signal is sent after the ANI caller category signal. It is used in Hungary.

#### **ani-not-avail**

This signal is sent to the CO when the caller's number is not available in response to the ANI request. It is used on DOD calls in Brazil and Columbia.

#### **digits 1 to 10**

The signals from group I.1 to I.10 are reserved for address digits 0 to 9.

#### **drop**

If this signal is received from the CO, the disconnect sequence is initiated by switch and the call drops.

### **end-of-ani**

If ANI digits are sent to the CO, a signal is sent to indicate the end-of-ANI digits. When incoming ANI is received, this signal indicates the end-of-ani digits. This signal is used on both DOD and DID calls.

### **end-of-dial**

The CO sends this signal to indicate the end-of-dial digits. The switch responds with a request for a group II signal. This signal is used when open numbering is used on DID calls.

### **end-of-digits**

This signal is sent by the origination switch when making outgoing calls, sending digits, and receiving a next-digit group A signal from the destination switch when there are no more digits to be sent.

This signal also may be sent when the switch does not have end-of-ani assigned, is making an outgoing call, is sending ANI, and is receiving a call-info-ani group A signal from the destination switch when there are no more ANI digits to be sent.

If both end-of-digits and end-of-ani are assigned, the switch uses end-of-an after sending the last ANI digit and end-of-digits after sending the last called-number digit.

### **ignored**

If this signal is received from the CO, it is acknowledged by a corresponding signal (that is, A.1, and so on) from the switch but no action is taken in the response and it is not counted as a digit. When this signal is received in countries other than Belgium, it is acknowledged. In Belgium, it is not acknowledged.

### **maint-call**

The CO sends a signal to indicate that a call is a maintenance call. This signal may be used on DID calls in Saudi Arabia. If the switch receives this tone, it prepares the special maintenance call sequences for the CO depending on the type of maintenance call.

### **send-congestion**

If the switch receives this signal from the CO on a DID call, it returns a congestion signal (group A) to the CO. The congestion signal is sent in compel mode rather than in pulse mode.

## **Group II signals**

Group II signals are a more elaborate set of forward signals generated by the originating switch, as follows:

### **attendant**

If the switch receives this signal on DID calls, the call terminates at an attendant regardless of the extension dialed. On DOD calls, this signal is sent to the CO if the CO requests calling-category information and the originating extension is an attendant. This signal is used on both DID and DOD calls.

### **busy-rt-attd**

If the switch receives this signal on DID calls, the call terminates at an attendant if the called extension is busy or at the called extension if it is not busy. This signal is used on DID calls.

### **data-call**

If the switch receives this signal on DID calls and the terminating extension is not a data extension, intercept treatment is given. On DOD calls, this signal is sent to the CO if the CO requests calling-category information and the originating extension is a data extension. This signal is used on both DID and DOD calls.

### **drop**

If this signal is received from the CO, the disconnect sequence is initiated by switch and the call drops.

### **maint-call**

If the CO sends this signal to the switch on a DID call, the call is a maintenance call. When the switch receives this signal, it prepares a special maintenance sequence for the call. The sequence depends upon the type of maintenance call expected.

### **normal**

This signal is used to indicate that the caller is a normal subscriber. If it is received on a DID call, the call is terminated at the called extension. For an outgoing MF signaling call that uses group II signaling, this signal is sent to the CO when the CO requests calling-category information and the originating extension is a station. This signal is used in both DID and DOD calls.

### **send-intercept**

If the switch receives this signal from the CO on a DID call, it returns group B intercept signal to the CO.

### **toll-auto**

This signal indicates that a call is an automatic toll call. When the call terminates at a busy station and a special busy signal is defined, the busy signal is sent to the CO. You can define the special busy signal by choosing the option toll-busy on the incoming group B signals. This signal is used in China.

## **toll-operator**

This signal, used in China, is treated as a normal subscriber signal. See the normal definition.

## **Group A signals**

Group A signals are basic backward signals generated by the destination switch, as follows:

### **send-ani**

The CO sends this signal to request calling-party category and sends additional signals to request ANI digits. This signal is sent to the CO when DEFINITY ECS requests ANI digits on DID calls. This signal is used on both DOD and DID calls.

### **congestion**

The CO sends this signal to indicate that it is experiencing network congestion. When the switch receives this signal on DOD calls, the switch drops the trunk and plays reorder tone to the calling party. This signal is used on DOD calls.

### **drop**

When this signal is sent, the receiving switch initiates disconnect sequence.

### **end-of-dial**

This signal is sent to indicate the end of the address digit string. For MF group II calls, this signal requests a group II signal and switches the sender over to the group B signaling mode. This signal is used on both DID and DOD calls.

### **resend-digit**

The switch sends this signal to adjust the outpulsing pointer so that the last digit can be resent again. This signal is used on DOD calls.

### **last-digit**

The switch sends this signal to adjust the outpulsing pointer so that the last 2 digits can be resent. This signal is used on DOD calls.

### **last-2-digits**

The switch sends this signal to adjust the outpulsing pointer so that the last 3 digits can be resent. This signal is used on DOD calls.

### **last-3-digits**

The switch sends this signal to adjust the outpulsing pointer so that the last 4 digits can be resent. This signal is used on DOD calls.

### **next-digit**

The switch sends this signal to request the next digit. This signal is used on both DID and DOD calls.

### **next-ani-digit**

The switch sends this signal to request the next ANI digit. This signal is used on DID and DOD calls.

### **restart**

The switch sends this signal to request the whole digit string again. This signal is used on DOD calls.

### **setup-sppath**

The CO sends this signal to the switch to set up a speech path. This signal is used on DOD calls and on DID calls in Belgium.

## **Group B signals**

Group B signals enhance group A signals for backward signaling from the destination switch by providing the status of the called party. In addition, if the originating switch uses group II signals, the destination switch answers with group B signals. Group B signals are as follows:

### **busy**

This signal is sent to indicate that the called party is busy. On DID calls, the signal is sent to the CO if there is no coverage point to terminate the call. If the switch receives this signal on DOD calls, it plays busy tone to the calling party and drops the trunk.

### **congestion**

This signal is sent to indicate that the system is congested and the call cannot be terminated successfully. On DID calls, the signal is sent to the CO to indicate that a resource is not available. On DOD calls, if the switch receives this signal, reorder tone is played to the calling party and the trunk is dropped.

### **free**

This signal is sent to indicate that the called party is idle. On DID calls, the signal is sent to the CO to indicate that the called party is idle and the call is terminated successfully. If the switch receives this signal on DOD calls, it connects the trunk to the calling party.

### **intercept**

This signal is sent to indicate that the called party number is not in service or is not correct. On DID calls, if intercept treatment is set to provide a tone, tone is sent to the CO to indicate that the called number is not valid. If the switch receives the signal on DOD calls, the switch plays intercept tone to the calling party and drops the trunk.

### **toll-busy**

This signal, used in China, is sent to indicate that the called party is busy if the call is an automatic toll call.

## Music Sources

---

This form defines music sources for Tenant Partitions. Each music source defined on the form can be used by one or more Tenant Partitions. However, a partition may have only one music source.

 **NOTE:**

If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from, or pay fees to, a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI). You can purchase a Magic Hold<sup>®</sup> system, which does not require such a license, from Lucent Technologies.

### Administration commands

---

This form is accessible only if `Tenant Partitioning` is enabled on the System-Parameters Customer-Options form.

You can use the change and display commands to administer the Tenant Partitions. The syntax for executing these commands is provided below.

| Action  | Object        | Qualifier <sup>1</sup> |
|---------|---------------|------------------------|
| change  | music-sources |                        |
| display | music-sources | [print or schedule]    |

---

1. Brackets indicate that the qualifier is optional.

 **NOTE:**

The maximum number of music sources is 20 for GAZ and 100 for MIPS.

**Form instructions**

**Page 1 of the Music Sources form**

| Music Sources |       |         |                | Page 1 of X |

| 15            | none  |         |                |             |

**Screen 5-124. Music Sources form sample (page 1)**

- **Source** — This is a display only field.
- **Type** — Enter the type of treatment to be provided by the music source. The options are **music**, **tone**, or **none**. If you entered a value in Music/Tone on Hold on the Feature-Related System Parameters form, that value will appear in this field. Only one music source is allowed to use tone-on-hold.
- **Port** — This field appears only if you entered **music** in Type. Enter the auxiliary trunk or analog port address of the music source. Duplicates are not allowed.
- **Description** — This field appears only if you entered **music** or **tone** in Type. Enter a 20 character (maximum) description of the administered music source.

**NOTE:**

When Tenant Partitioning is enabled, Music/Tone on Hold on the Feature-Related System Parameters form disappears. However, the value in that field (tone, music, or none) will appear as the first entry on the Music Sources form. If the value was **music**, the port number will also appear on the Music Sources form. When Tenant partitioning is disabled, Music/Tone on Hold reappears on the Feature-Related System Parameters form, along with and the values from the Music Sources form.

## **Implementation notes**

---

Page 2, for R5vs/si and later configurations, and pages 2 through 4, for G3r, contain the same information as Page 1, and do not display here to conserve space. Remember that the maximum number of music sources for R5vs/si and later configurations is 20 and the maximum for G3r is 100.

## Packet Gateway Board

This form administers the Packet Gateway (PGATE) circuit pack.

**⇒ NOTE:**

The PGATE form only displays for R5r and later configurations.

### Administration commands

Use the following commands to access the PGATE form.

| Action  | Object | Qualifier   |
|---------|--------|---|
| add     | pgate  | Enter the circuit pack cabinet, carrier, and slot |
| change  | pgate  | Enter the circuit pack cabinet, carrier, and slot |
| display | pgate  | Enter the circuit pack cabinet, carrier, and slot |
| remove  | pgate  | Enter the circuit pack cabinet, carrier, and slot |

### Form instructions

Make assignments as required for the following fields on the form:

#### Page 1 of the form

PACKET GATEWAY BOARD Page 1 of 1

Board Location: \_\_\_\_\_ Name: \_\_\_\_\_

Application: X.25

External cable type: rs232

Port configuration: 1) rs232 2)rs232 3)rs232 4)rs232

#### Screen 5-125. Packet Gateway Board form

- **Board Location** — Enter five characters. The first two represent the cabinet (01 to 22). The third represents the carrier (A through E). The fourth and fifth are the slot numbers within the carrier (01 to 20 for medium cabinets, 01 to 18 for XE cabinets).
- **Name** — Enter up to 15 alphanumeric characters as the name of the adjunct with which the PGATE circuit pack communicates.

- **Application** — A display-only field indicating that the communications protocol used to transmit messages over the PGATE is "X.25".
- **External Cable Type** — A display-only field indicating that "rs232" is the type of physical interface being used between the PGATE port and the adjunct.
- **Port Configuration** — A display-only field indicating that the port is configured for "rs232" communication.

## Processor Channel Assignment for R5r and later Installations

This form assigns Processor Channels to the System's interface links and hop channels for R5r and later configurations.

### Administration commands

Use the following commands to administer the Processor Channel Assignment form.

| Action  | Object                  | Qualifier <sup>1</sup>                     |
|---------|-------------------------|--|
| change  | communication-interface | processor channels                         |
| display | communication-interface | processor channels ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

### Form instructions

Make assignments as required for the following fields on each page of the form:

#### Pages 1 through 8 of the form

| Proc<br>Chan | Application | PROCESSOR CHANNEL ASSIGNMENT |               |                |                 |       | Page 1 of 8 |
|--------------|-------------|------------------------------|---------------|----------------|-----------------|-------|-------------|

| 14:          | _____       | ___                          | ___           | ___            | ___             | _____ | ___         |
| 15:          | _____       | ___                          | ___           | ___            | ___             | _____ | ___         |
| 16:          | _____       | ___                          | ___           | ___            | ___             | _____ | ___         |

- **Proc Chan** — This field is display-only and indicates each of the processor channels.
- **Application** — Enter the type of application that connects to this processor channel. Valid entries are noted in the Application Entry column in [Table 5-4](#).

**Table 5-4. Applications**

| Application Entry | Processor Description                |
|-------------------|--------------------------------------|
| audix             | AUDIX                                |
| cpn/bn            | CPN/BN (ISDN Gateway)                |
| dcs               | DCS                                  |
| gateway           | ISDN Over PRI D-channel Gateway      |
| mis               | CMS                                  |
| msaamwl           | MSA Automatic Message Waiting Lamp   |
| msack             | Switch/MSA Clock Synchronization     |
| msahlwc           | MSA High Priority Leave Word Calling |
| msallwc           | MSA Low Priority Leave Word Calling  |
| msamcs            | MSA Message Center Service           |

- **Interface Link** — Enter the interface link (1 to 16) to connect the processor channel to.
- **Interface Chan** — This field, together with `Interface Link`, identifies the link/channel pair that is associated with the local processor channel. Enter a number from 1 to 64 to identify the interface channel that is associated with the local processor channel. The Interface Link/Channel association establishes a network channel to the remote machine. (This field and `Interface Chan` must be assigned as a pair or both left blank).

**NOTE:**

Once a Link/Channel Pair is assigned on the Processor Channel Assignments form, the pair cannot be assigned on the Hop Channel Assignments form (for more information, see [“Hop Channel Assignments Form”](#) on page 12-116).

- **Local Port** — The port (1 to 64) on which this PBX expects the connection to be established.
- **Remote Port** — The port (1 to 64) on which the far end expects the connection to be established.

**5 Basic Forms**

*Processor Channel Assignment for R5r and later Installations*

For a far end, this Remote Port entry should match the far end's Local Port entry. Generally, the local and remote port values are administrable on both ends of the connection, and it is required that the local port (administered on one end) match the remote port (administered on the other). The terms "local port" and "remote port" are called different things on different switches and adjuncts, so care must be taken to make sure the correct numbers match. In addition, the "logical channel" (sometimes called the "interface channel") must be the same at both ends of the connection.

For each application, the following table shows the expected "Application Field" value, and what values on the far end must be matched with the values on the local machine for remote port, local port, and logical channel. The specifications in the table are those used on the far end adjunct or switch. For example:

- On other switches and the AUDIX adjunct the logical channel and local and remote port values are administrable, so whatever values are administered on the far-end must be matched appropriately (see table) on the local switch.
- For CMS and the ISDN Gateway (CPN/BN) adjuncts, the logical channel is administrable through the X.25 package administration. The local port and remote port can be administered via the application (for example, CMS or ISDN Gateway) package.
- On the 3B2 messaging server adjunct (MSA) five processor channels (for each of the five different "msa" application types) must be administered. The logical channel and remote port are dictated by the application field. Only the message server number is administrable (to indicate which of the 7 possible message servers this is) on the MSA itself. The local port depends upon the MSA number (to indicate the port the MSA will direct the connection to). The values shown in the next table are for MSAs numbered 1 through 7, respectively.

| <b>Application</b> | <b>Application Held Value</b> | <b>Logical Channel Value</b> | <b>Local Port Value</b> | <b>Remote Port Value</b> |
|--------------------|-------------------------------|------------------------------|-------------------------|--------------------------|
| System 75          | dcs                           | IF chan. no.                 | remote proc. chan. no.  | proc. chan. no.          |
| Definity G1        | dcs                           | IF chan. no.                 | remote proc. chan. no.  | proc. chan. no.          |
| Definity G3i       | dcs                           | IF chan. no.                 | remote proc. chan. no.  | proc. chan. no.          |
| System 85          | dcs                           | IF chan. no.                 | remote port no.         | local port no.           |
| Definity G2        | dcs                           | IF chan. no.                 | remote port no.         | local port no.           |
| Definity G3r       | dcs                           | IF chan. no.                 | remote port no.         | local port no.           |

5 Basic Forms

Processor Channel Assignment for R5r and later Installations

| Application  | Application Held Value | Logical Channel Value | Local Port Value    | Remote Port Value |
|--------------|------------------------|-----------------------|---------------------|-------------------|
| AUDIX        | audix                  | logical chan. no.     | switch port no.     | audix port no.    |
| CMS          | mis                    | logical chan. no.     | remote port no.     | local port no.    |
| ISDN Gateway | cpn/bn                 | logical chan. no.     | remote port no.     | local port no.    |
| MSA          | msamcs                 | 1                     | 1,10,15,30,38,46,54 | 1                 |
| MSA          | msahlwc                | 2                     | 2,11,16,31,39,47,55 | 2                 |
| MSA          | msallwc                | 3                     | 3,12,17,32,40,48,56 | 3                 |
| MSA          | msaamwl                | 4                     | 4,13,18,33,41,49,57 | 4                 |
| MSA          | msack                  | 8                     | 8,9,14,19,37,45,53  | 8                 |

- **Adjunct Name** — The AUDIX or MSA Application chooses which Adjunct this processor channel is communicating with (names are from the Adjunct Names form).
- **Machine-ID** — Enter the Machine ID number (1 to 99, or blank) associated with the port if Application is **dcs**, **audix**, or **cpn/bn**. When supporting AUDIX, the Machine ID must agree with the AUDIX field entry on the AUDIX System Translations — Switch-Connection form (part of AUDIX translations). Typically, with just one AUDIX, this entry is 1.

## Processor Channel Assignment for R5si and later Installations

---

Used to assign Processor Channels to the System's interface links for R5si and later configurations.

### Administration commands

---

Use the following commands to administer the Processor Channel Assignment form.

| Action  | Object                  | Qualifier <sup>1</sup>                     |
|---------|-------------------------|--|
| change  | communication-interface | processor channels                         |
| display | communication-interface | processor channels ['print' or 'schedule'] |

- 
1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

### Form instructions

---

Make assignments as required for the following fields on each page of the form:

Pages 1 through 4 of the form

| PROCESSOR CHANNEL ASSIGNMENT |       |           |      |          |           |   | Page 1 of 4 |
|------------------------------|-------|-----------|------|----------|-----------|---|-------------|
| Proc Chan                    | Appl. | Interface |      | Priority | Remote    |   | Machine-ID  |
|                              |       | Link      | Chan |          | Proc Chan |   |             |

| 14:                          | _____ | -         | -    | _____    | -         | - | _____       |
| 15:                          | _____ | -         | -    | _____    | -         | - | _____       |
| 16:                          | _____ | -         | -    | _____    | -         | - | _____       |

Screen 5-127. Processor Channel Assignment — R5si and later form (page 1 of 4)

- **Proc Chan** — This field is display-only and indicates each of the 64 processor channels.
- **Appl.** — Enter the type of application that connects to this processor channel. Valid entries are noted in the Entry column in the "Processor Channel Applications" table that follows.

**NOTE:**  
 MSA applications, if administered, must be assigned to fixed processor and remote processor (MSA) channels (1, 2, 3, 4, and 8, respectively) as shown on the table. Therefore, it is recommended that channels 1, 2, 3, 4, and 8 be reserved for Messaging Server Adjunct (MSA) connectivity since the MSA uses fixed channel numbers.

**NOTE:**  
 Channel 10 should be reserved for MIS and Channel 59 for AUDIX.

When the Management Information System (MIS) adjunct processor is a Messaging Server Adjunct, the `Appl` field must be **msamis**. For MIS 3B adjunct processors, `Appl` is set to **mis**.

If `Appl` is administered as **isdn**, then no other channels may use the interface link specified for this processor channel. A link used for ISDN-PRI cannot be multiplexed to provide other applications.

5 Basic Forms

Processor Channel Assignment for R5si and later Installations

When "OCM" is used, the associated interface link may be used to interface either an Outbound Call Management (OCM) adjunct or and ISDN Gateway adjunct (supports CPN/BN applications) but not both.

If a processor channel is not assigned, leave this field blank.

| Appl. Entry | Processor Description                | Channel | Priority |
|-------------|--------------------------------------|---------|----------|
| audix       | AUDIX                                | 59      | high (h) |
| dcs         | DCS                                  | -       | high (h) |
| isdn        | ISDN-PRI                             | -       | high     |
| mis         | MIS                                  | 10      | low (l)  |
| msaamwl     | MSA Automatic Message Waiting Lamp   | 4       | low (l)  |
| msaclk      | Switch/MSA Clock Synchronization     | 8       | high (h) |
| msahlwc     | MSA High Priority Leave Word Calling | 2       | high (h) |
| msallwc     | MSA Low Priority Leave Word Calling  | 3       | low (l)  |
| msamcs      | MSA Message Center Service           | 1       | high (h) |
| msamis      | MSA/MIS                              | -       | low (l)  |
| OCM         | Outbound Call Management             | -       | high     |

- **Interface Link** — Enter a number from **1** to **8** for multi-carrier cabinets (**1** to **4** for single-carrier cabinets) to identify the interface link/channel pair used to establish a connection to the remote machine. (This field and `Interface Chan` must be assigned as a pair or both left blank except when `Appl` is **isdn**.) This is the link number assigned on the Processor Interface Data Module form.
- **Interface Chan** — This field, together with `Interface Link`, identifies the link/channel pair that is associated with the local processor channel. Enter a number from **1** through **64** to identify the interface channel that is associated with the local processor channel. The Interface Link/Channel association establishes a network channel to the remote machine. (This field and `Interface Chan` must be assigned as a pair or both left blank except when `Appl` is **isdn**.)

Once a Link/Channel Pair is assigned on the Processor Channel Assignments form, the pair cannot be assigned on the Hop Channel Assignments form (for more information, see [“Hop Channel Assignments Form” on page 12-116](#)).

- **Priority** — Enter **h** (high) or **l** (low) to indicate the priority of this processor channel. High-priority channels have precedence over the low-priority channels. Assignments should be made based on the operational speed of the links and the number of hops in the network channel. Enter the appropriate priority (as per the "Processor Channel Applications" table).
- **Remote Proc Chan** — Cannot be assigned when `App1` is **isdn**. Enter the processor channel number (**1** through **64**) of the remote switch that connects to the local processor channel.
- **Machine-ID** — Enter the Machine ID number associated with the port if `App1` is **dcs**, **audix**, or **ocm**; otherwise, leave this field blank. Machine-IDs are administered as part of the Uniform Dial Plan (UDP). Valid entries are **1** through **99** or leave blank. When supporting AUDIX, the Machine ID must agree with the AUDIX field entry on the AUDIX Data Link form (part of AUDIX translations). Typically, with just one AUDIX, this entry is **1**.

## Pickup Group

This form implements call pickup groups with up to 50 extensions per group. A pickup group is a group of users authorized to answer calls to a voice terminal extension within that group of users. A voice terminal extension number can only belong to one pickup group.

### Administration commands

Use the following commands to administer the Pickup Group form.

|                     | Action  | Object         | Qualifier <sup>1</sup>   |
|---------------------|---------|----------------|--|
| Without Hospitality | add     | pickup-group   | 1-MAX (or 'next')  |
| Parameter Reduction | change  | pickup-group   | 1-MAX  |
| Feature             | display | pickup-group   | 1-MAX ['print' or 'schedule']  |
|                     | list    | intercom-group | [1-MAX]['number' x]['to-number' x]['count' n]<br>['print' or 'schedule'] |
|                     | remove  | pickup-group   | 1-MAX  |
| With Hospitality    | add     | pickup-group   | 1-5 (or 'next')  |
| Parameter Reduction | change  | pickup-group   | 1-5  |
| Feature             | display | pickup-group   | 1-5 ['print' or 'schedule']  |
|                     | list    | intercom-group | [1-5]['number' x]['to-number' x]['count' n]<br>['print' or 'schedule']   |
|                     | remove  | pickup-group   | 1-5  |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered. MAX is the maximum number available in your system configuration.

## Form instructions

---

Make assignments as required for the following fields on each page of the form:

### Pages 1 and 2 of the form

```

Page 1 of 2
PICKUP GROUP

### Screen 5-128. Pickup Group form (page 1 of 2)

- **Group Number** — Enter a Pickup Group number when completing a paper form. This is a display-only field when the form is accessed using an administration command such as **add** or **change**. If `Hospitality Parameters Reduction` is enabled on the `System-Parameters Customer-Options` form, only five (maximum) group numbers may be assigned.
- **Ext** — Enter the extension number of each user in the group. A VDN cannot be assigned to a Call Pickup group.
- **Name** — Make no entry. The name is assigned to the above extension number when the users and their associated extensions were administered.

## Remote Access

---

### SECURITY ALERT:

*Lucent Technologies has designed the Remote Access feature incorporated in this product that, when properly administered by the customer, will enable the customer to minimize the ability of unauthorized persons to gain access to the network. It is the customer's responsibility to take the appropriate steps to properly implement the features, evaluate and administer the various restriction levels, protect access codes and distribute them only to individuals who have been advised of the sensitive nature of the access information. Each authorized user should be instructed concerning the proper use and handling of access codes.*

*In rare instances, unauthorized individuals make connections to the telecommunications network through use of remote access features. In such an event, applicable tariffs require that the customer pay all network charges for traffic. Lucent Technologies cannot be responsible for such charges, and will not make any allowance or give any credit for charges that result from unauthorized access.*

To assist you in maintaining the security of your system, DEFINITY ECS provides the Status Remote Access command, which provides information and status on each remote access barrier code and on the remote access feature. A sample Status Remote Access screen follows the Remote Access form.

The Remote Access form is used to implement the Remote Access feature. Remote Access permits a caller located outside the System to access the System through the public or private network and then use the features and services of the System.

Remote Access users can dial into the System using Central Office, Foreign Exchange, WATS, and ISDN-PRI trunks. In addition, a dedicated Remote Access Direct Inward Dialing number can be provided.

To ensure the security of your system, consider the following:

1. All remote access facilities should be unlisted directory telephone numbers.
2. Users should be required to enter a Barrier Code of seven random digits AND an Authorization Code of at least seven random digits to make network calls.
3. Authorization Codes should be nonconsecutive (random) and changed at least quarterly.
4. Deactivate Authorization Codes immediately if the user leaves the company or changes assignments.
5. Each Authorization Code should have assigned the minimum level of calling permissions required.

6. When possible, block off-hours and weekend remote access calling. Use Alternative Facility Restriction Levels, if available.
7. Use a voice recording, warble tone, or no tone and avoid use of a dial tone as a prompt when the remote access unit answers.
8. Assign the lowest possible FRL to only allow internal PBX calls.

As an additional step to ensure System security, you can permanently disable the Remote Access feature if you do not intend to use it now or in the future. If you do decide to permanently disable the feature, it will require Services intervention to activate the feature again.

**⚠ CAUTION:**

*Your attempt to disable the Remote Access feature will be lost if the switch is rebooted without saving translations. Therefore, execute a "save translation" command after permanently disabling the Remote Access feature.*

**Administration commands**

---

Use the following commands to administer the Remote Access form. In some cases, just the most commonly used commands are shown. See [Appendix B, "Administration Commands"](#), for a complete listing of all administration commands, the command structure, and the use of abbreviated command words when entering a command.

| Action  | Object        | Qualifier <sup>1</sup>  |
|---------|---------------|-------------------------|
| change  | remote-access | —                       |
| display | remote-access | ['print' or 'schedule'] |
| list    | remote-access |                         |
| status  | remote-access | ['print']               |

---

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

**Screen 5-130. Remote Access Status form**

Make assignments as required for the following fields on the form:

- **Remote Access Extension** — Enter an extension number (cannot be a VDN extension) for Remote Access. This extension is associated with each trunk that supports the Remote Access feature. This field can be left blank if no barrier code is assigned and the Remote Access feature is not accessible. The default for this field is blank. The remote access extension

is used as if it was a DID extension. Only one DID extension can be assigned as the remote access extension. Calls to that number are treated the same as calls on the remote access trunk.

When a trunk group is dedicated to Remote Access, the remote access extension number is administered on the trunk group's incoming destination field.

- **Barrier Code Length** — Enter the desired barrier code length (4 to 7 digits), or leave this field blank indicating that a barrier is not required. Assigning a barrier code length of 7 provides maximum security.
- **Authorization Code Required** — Enter **y** if an authorization code must be dialed by Remote Access users to access the system's Remote Access facilities. Default is **n**. Use of an authorization code in conjunction with barrier codes increases the security of the Remote Access feature.
- **Remote Access Dial Tone** — This field appears on the form if `Authorization Code Required` is **y**. Enter **y** in this field if Remote Access Dial Tone is required, as a prompt to the user, to enter an authorization code to access Remote Access. Enter **n** if Remote Access Dial Tone is not required as a prompt.
- **Barrier Code** — Assign a barrier code that conforms to the number entered in Barrier Code Length. All codes must be a 4- to 7-digit number. The code can be any combination of the digits 0 through 9. If Barrier Code Length is blank, the first `Barrier Code` field must be specified as **none**. Duplicate entries are not allowed. The system default for this field is a blank. Assign a 7-digit number in this field for maximum security.
- **COR** — Enter the class of restriction (COR) number (**0** through **95**) associated with the barrier code that defines the call restriction features. Default is **1**. Assigning the most restrictive COR that provides only the level of service required, will provide the maximum security.
- **TN** — Enter the Tenant Partition number. Default is **1**.
- **COS** — Enter a class of service (COS) number (**0** through **15**) associated with the barrier code that defines access permissions for Call Processing features. Default is **1**. Assigning the most restrictive COS that provides only the level of service required provides the maximum security.
- **Expiration Date** — Assign an expiration date based on the expected length of time the barrier code will be needed. Enter the date the remote access barrier code will expire. Valid entries are a date greater than the current date or a blank. Default is tomorrow's date. If it is expected that the barrier code will be used for a 2-week period, assign a date two weeks from the current date. If the Expiration Date is assigned, a warning message is displayed on the system copyright screen seven days prior to the expiration date. The system administrator can modify the expiration date to extend the time interval if needed.
- **No. of Calls** — This field specifies the number of Remote Access calls that can be placed using the associated barrier code. Valid entries are any number from 1 to 9999 or a blank. The default is one call. The

Expiration Date and No. of Calls fields can be used independently or in conjunction to provide the maximum security. If both the Expiration Date and No. of Calls fields are assigned, the corresponding barrier code expires when the first of these criteria is satisfied.

- **Calls Used** — This is a display-only field that specifies the number of calls that have been placed using the corresponding barrier code. This field is incremented each time a barrier code is successfully used to access the Remote Access feature. A usage that exceeds the expected rate can indicate improper use.
- **Permanently Disable** — A **y** in this field permanently disables the Remote Access feature. Once you have set this field to **y**, you permanently block access to the administration interface. Reactivation of access to the interface requires Lucent Services intervention.
- **Disable Following a Security Violation** — A **y** in this field disables the remote access feature following detection of a remote access security violation. This field appears on the form if the remote access component of the SVN feature is enabled. The system administrator can re-enable Remote Access with the “enable remote access” command. This field appears on the form if the remote access component of the SVN feature is enabled.

## Remote Call Coverage Table

The Remote Call Coverage Table allows you to provide automatic redirection of certain calls to alternate off-net answering positions in a Coverage path for any valid dialed number up to 16 digits that begins with an Automatic Alternate Routing (AAR) or Automatic Route Selection (ARS) feature access code (FAC), outgoing trunk dial access code (TAC), or UDP/DCS extension.

### Administration commands

Use the following commands to administer the Remote Call Coverage form.

| Action  | Object   | Qualifier |
|---------|----------|-----------|
| change  | coverage | remote    |
| display | coverage | remote    |

### Form instructions

Make assignments as required for the following fields on the form:

Enter coverage points into the numbered fields on the form. Valid coverage points are valid dialed numbers up to 16 digits that begin with an AAR or ARS FAC, outgoing trunk TAC, or UDP/DCS extension. Up to 999 remote call coverage points can be entered on the 23 pages of this form.

#### REMOTE CALL COVERAGE TABLE

|           |           |           |
|-----------|-----------|-----------|
| 01: _____ | 16: _____ | 31: _____ |
| 02: _____ | 17: _____ | 32: _____ |

| 13: _____ | 28: _____ | 43: _____ |
| 14: _____ | 29: _____ | 44: _____ |
| 15: _____ | 30: _____ | 45: _____ |

## Second Digit Table

You must complete the Second Digit Table each time you enter **misc** in the digit length of 1 column on the Dial Plan Record form. The second digit table is named for the row where the "misc" appears. In addition, a second digit table can exist for every first digit value.

### Administration commands

Use the following commands to administer the Second Digit Table form.

| Action  | Object       | Qualifier <sup>1</sup> |
|---------|--------------|------------------------|
| add     | second-digit | 0-9                    |
| change  | second-digit | 0-9                    |
| display | second-digit | [print or schedule]    |

1. Brackets [ ] indicate the qualifier is optional.

### Form instructions

Page 1 of 1

SECOND DIGIT TABLE FOR DIGIT \_

| SECOND DIGIT TABLE   |                  |                      |                  |
|----------------------|------------------|----------------------|------------------|
| Digit Identification | Number of Digits | Digit Identification | Number of Digits |
| 0: _____             | 0                | 5: _____             | 0                |
| 1: _____             | 0                | 6: _____             | 0                |

| 3: _____             | 0                | 8: _____             | 0                |
| 4: _____             | 0                | 9: _____             | 0                |

#### Screen 5-132. Second Digit Table form (page 1 of 1)

Make assignments as required for the following fields on the form:

- **Digit** — A display-only field that marks the value of the second digit.
- **Identification** — Enter an abbreviation to identify the dialed number if a particular second digit is dialed. Valid entries are **attd**, **extension**, **tac**, and **fac**. See the first digit table information, in [“Dial Plan Record”](#) above, for explanations of these.

- **Number of Digits** — Enter the length of the dialed number. Valid entries are **2** for attd, **2** through **5** for extension, **2** through **4** for tac (**2** through **3** with DCS), and **2** through **4** for fac.

## Security-Related System Parameters

This form supports the Security Violation Notification feature.

### Administration commands

You can use the change and display commands to administer the Security-Related System Parameters form. The syntax for executing these commands is provided below.

| Action  | Object                     | Qualifier <sup>1</sup>  |
|---------|----------------------------|-------------------------|
| change  | system-parameters security | —                       |
| display | system-parameters security | ['print; or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional.

### Form instructions

Make assignments as required for the desired fields on the form:

### Page 1 of the form

SECURITY-RELATED SYSTEM PARAMETERS Page 1 of 2

SECURITY VIOLATION NOTIFICATION PARAMETERS

SVN Login Violation Notification Enabled? y  
Originating Extension: \_\_\_\_\_ Referral Destination: \_\_\_\_\_  
Login Threshold: 5\_ Time Interval: 0:03  
Announcement Extension: \_\_\_\_\_

SVN Remote Access Violation Notification Enabled? y  
Originating Extension: \_\_\_\_\_ Referral Destination: \_\_\_\_\_  
Barrier Code Threshold: 10 Time Interval: 0:03  
Announcement Extension: \_\_\_\_\_

SVN Authorization Code Violation Notification Enabled? y  
Originating Extension: \_\_\_\_\_ Referral Destination: \_\_\_\_\_  
Authorization Code Threshold: 10 Time Interval: 0:03  
Announcement Extension: \_\_\_\_\_

Screen 5-133. Security-Related System Parameters form (page 1 of 2)

**SVN Login Violation Notification Enabled** — Set to **y** if you want SVN login violation notification. Default is **n**. If this field is “**y**,” the following fields appear:

- **Originating Extension** — This field requires the entry of an unassigned extension that is local to the switch and conforms to the dial plan for the purpose of originating and identifying SVN referral calls for login security violations. The originating extension initiates the referral call in the event of a login security violation. It also sends the appropriate alerting message or display to the referral destination.
- **Referral Destination** — This field requires an entry of an extension, assigned to a station, attendant console, or vector directory number (VDN) that receives the referral call when a security violation occurs. If a VDN is assigned, the Call Vectoring Time-of-Day routing capability may be used to route the referral call to different destinations based on the time of day or the day of the week. The referral destination must be equipped with a display module unless the Announcement Extension is assigned. Administration of the Announcement Extension is also required if the referral destination is a VDN.
- **Login Threshold** — This field requires an entry of the minimum number of login attempts that are permitted before a referral call is made. The value assigned to this field, in conjunction with Time Interval, determines whether a security violation has occurred. Default is **5**.
- **Time Interval** — This field requires the entry of the time interval in which a login security violation must occur. The range for the time interval is one minute to eight hours (0:01 to 7:59), and is entered in the form "x:xx." For example, if you want the time interval to be one minute, you enter 0:01. If you want the time interval to be seven and one-half hours, you enter 7:30. Default is **0:03**.
- **Announcement Extension** — This field permits entry of a previously administered extension that is assigned to an SVN login violation announcement. Default is blank.

**SVN Remote Access Violation Notification Enabled**— Set to **y** to activate SVN remote access violation notification. Default is **n**. If this field is “**y**,” the following fields appear:

- **Originating Extension** — This field requires the entry of an unassigned extension that is local to the switch and conforms to the dial plan for the purpose of originating and identifying SVN referral calls for remote access barrier code violations. The originating extension initiates the referral call in the event of a Remote Access security violation. It also sends the appropriate alerting message or display to the referral destination.
- **Referral Destination** — This field requires an entry of an extension, assigned to a station, attendant console, or vector directory number (VDN) that receives the referral call when a security violation occurs. If a VDN is assigned, the Call Vectoring Time-of-Day routing capability may be used to route the referral call to different destinations based on the time of day or the day of the week. The referral destination must be equipped with a

display module unless the Announcement Extension is assigned. Administration of the Announcement Extension is also required if the referral destination is a VDN.

- **Barrier Code Threshold** — This field requires an entry of the minimum number of remote access barrier code attempts that are permitted before a referral call is made. The value assigned to this field, in conjunction with Time Interval, determine whether a security violation has occurred. Default is **10**.
- **Time Interval** — This field requires the entry of the time interval in which the remote access barrier code attempts must occur. The range for the time interval is one minute to eight hours (0:01 to 7:59), and is entered in the form "x:xx." For example, if you want the time interval to be one minute, you enter "0:01." If you want the time interval to be seven and one-half hours, you enter "7:30." The system default is **0:03**.
- **Announcement Extension** — This field permits entry of a previously administered extension that is assigned to an SVN remote access barrier code violation announcement. The default is blank.

**SVN Authorization Code Violation Notification Enabled** — Enter **y** to activate SVN authorization code violation notification. Default is **n**. If this field is **y**, the following fields appear:

- **Originating Extension** — This field requires the entry of an unassigned extension that is local to the switch and conforms to the dial plan for the purpose of originating and identifying SVN referral calls for authorization code security violations. The originating extension initiates the referral call in the event of a authorization code security violation. It also sends the appropriate alerting message or display to the referral destination.
- **Referral Destination** — This field requires an entry of an extension, assigned to a station, attendant console, or vector directory number (VDN) that receives the referral call when a security violation occurs. If a VDN is assigned, the Call Vectoring Time-of-Day routing capability may be used to route the referral call to different destinations based on the time of day or the day of the week. The referral destination must be equipped with a display module unless the Announcement Extension is assigned. Administration of the Announcement Extension is also required if the referral destination is a VDN.
- **Authorization Code Threshold** — This field requires an entry of the minimum number of invalid authorization code security violations attempts that are permitted before a referral call is made. The value assigned to this field in conjunction with Time Interval, determines whether a security violation has occurred. Default is **10**.
- **Time Interval** — This field requires the entry of the time interval in which the authorization code security violations must occur. The range for the time interval is one minute to eight hours (0:01 to 7:59), and is entered in

Screen 5-134. Security-Related System Parameters form (page 2 of 2)

**SVN Station Security Code Violation Notification Enabled** — Set to **y** to activate security violation notification for station security codes. Default is **n**. If this field is "**y**," the following fields appear:

- **Originating Extension** — This field requires the entry of an unassigned extension that is local to the switch and conforms to the dial plan for the purpose of originating and identifying SVN referral calls for station security code violations. The originating extension initiates the referral call in the event of a station security code violation. It also sends the appropriate alerting message or display to the referral destination. The originating extension cannot be used for any other purpose.
- **Referral Destination** — This field requires an extension, assigned to a station, attendant console, or vector directory number (VDN), that receives the referral call when a station security code violation occurs. If a VDN is assigned, the Call Vectoring Time-of-Day routing capability may be used to route the referral call to different destinations based on the time of day or the day of the week. The referral destination must be equipped with a

display module unless the Announcement Extension is assigned. Administration of the Announcement Extension is also required if the referral destination is a VDN.

- **Station Security Code Threshold** — This field requires an entry of the minimum number of invalid station security code attempts that are permitted before a referral call is made. The value assigned to this field, in conjunction with Time Interval, determines whether a security violation has occurred. You can enter a value of **1** to **255**; the system default is **10**.
- **Time Interval** — Enter the time interval in which a predetermined number (see *Station Security Code Threshold*, above) of SCC security violations must occur before an SCC security violation notification is sent. The range for the time interval is one minute to eight hours (0:00 to 7:59), and is entered in the form "x:yy," with x representing hours and y representing minutes. For example, if you want the time interval to be one minute, you enter 0:01. If you want the time interval to be seven and one-half hours, you enter 7:30. The system default is **0:03**.
- **Announcement Extension** — This field permits entry of a previously administered extension that is assigned to an SVN station security code violation announcement. The default is blank.

**Minimum Station Security Code Length** — Enter a value of **3–8**. This determines the minimum required length of the Station Security Codes that you enter on the Station form. Longer codes are more secure. If station security codes are used for external access to telecommuting features, the minimum length should be 7 or 8. The default is **4**.

**Security Code for Terminal Self Administration Required?** — Enter **y** (default) to indicate that a security code is required or **n** if a security code is not required.

**Access Security Gateway Parameters** — These fields are operational for Lucent technicians only. The Default is **n**.

## System Parameters Country-Options

This form implements parameters associated with certain international (including North American) call characteristics.

### Administration commands

Use the following commands to administer the Country Options System Parameters form. In some cases, just the most commonly used commands are shown. See [Appendix B, "Administration Commands"](#), for a complete listing of all administration commands, the command structure, and the use of abbreviated command words when entering a command.

| Action  | Object                            | Qualifier <sup>1</sup>  |
|---------|-----------------------------------|-------------------------|
| change  | system-parameters country-options | —                       |
| display | system-parameters country-options | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

### Form instructions

Make assignments as required for the following fields on each page of the form:

#### Page 1 of the form

Page 1 of 7

SYSTEM PARAMETERS COUNTRY-OPTIONS

```

Companding Mode: Mu Law           Base Tone Generation Set: 1
440Hz PBX-dial Tone? n           440Hz Secondary-dial Tone? n
Digital Loss Plan: 10            Version of Digital Loss Plan: B
Analog Ringing Cadence: 1       Set Layer 1 timer T1 to 30 seconds? n
Analog Line Transmission: 1     Enhanced 84xx Display Character Set? n

TONE DETECTION PARAMETERS
Tone Detection Mode: 6           Dial Tone Validation Timer:
Interdigit Pause: short
    
```

- **Companding Mode** — Enter **A-law** or **Mu-law** (default) to identify the companding algorithm to be used by system hardware.
- **Base Tone Generation Set** — Enter a country code (**1** through **19**) to identify the base tone generation set to be used. This field is meaningful only if the system tone detector is a TN780, vintage 4 or a TN2182. Default is **1** (U.S.).

**NOTE:**

A TN780 vintage 5 or greater or a TN2182 is required if Belgian Tones (Country code 8) are specified.

- **440Hz PBX-dial Tone** — Enter **y** or **n** (default) to specify whether the PBX (primary) dial tone will be changed to a continuous 440Hz/-17 tone. Entering **n** implies the tone will either be administered on a later page of this form or, if no individual definition is administered, as defined in `Base Tone Generation Set`.
- **440Hz Secondary-dial Tone** — Enter **y** or **n** (default) to specify whether the Secondary (CO) dial tone will be changed to a continuous 440Hz/-17 tone. Entering **n** implies the tone will either be administered on a later page of this form or, if no individual definition is administered, as defined in `Base Tone Generation Set`.
- **Digital Loss Plan** — Enter a country code (**1** through **17**) to identify the digital loss plan to be used by the system. Default is **1** (U.S.).
- **Version of Digital Loss Plan** — Appears when `Digital Loss Plan` is **10** (country code for UK). Enter **A** or **B** (default) to identify the digital-loss-plan version to be used.
- **Analog Ringing Cadence** — Enter a country code to identify the ringing cadence to be used by analog phones in the system. Default is **1** (U.S.).
- **Set Layer 1 timer T1 to 30 seconds** — Enter **y** or **n** (default) to specify whether the Layer 1 timer is set to 30 seconds.
- **Analog Line Transmission** — Enter the country code the corresponds to the transmission and signaling parameters you desire. Valid values are **1–18**. Default is **1**.
- **Enhanced 64xx/84xx Display Character Set** — Enter **y** to use enhanced font sets for display terminals. Default is **n**.

The next three fields control tone detection on the system:

- **Tone Detection Mode** — Enter a code (**1** through **5**) to specify the type of tone detection used on a TN420B (or later) tone-detection circuit pack. Default is **1**.

The codes have the following connotations:

1. Precise Italian tone detection algorithm
2. Precise Australian tone detection algorithm

3. Precise UK tone detection algorithm
  4. Imprecise normal broadband filter algorithm (valid with TN420C or later Tone Detector circuit pack)
  5. Imprecise wideband filter algorithm (valid with TN420C or later Tone Detector circuit pack)
- **Dial Tone Validation Timer** — Enter the number of milliseconds (0 through 6375 in increments of 25) that the dial tone validation routine will use to sample transmissions. This field appears only when `Tone Detection Mode` is equal to 4 or 5. (Valid with TN420C or later Tone Detector circuit pack.) Default is 600.
  - **Interdigit Pause** — Enter **short** (5 to 30ms) or **long** (20 to 40ms) to specify the maximum length of the inter-digit pause. Breaks lasting less than this range will be bridged or ignored. (Valid with TN420C or later Tone Detector circuit pack.) Default is **short**.

Pages 2 through 7 of the form

Page 2 of 7

| Tone Name | SYSTEM PARAMETERS COUNTRY-OPTIONS |              |                        |
|-----------|-----------------------------------|--------------|------------------------|
| Cadence   | Tone                              |              |                        |
| Step      | (Frequency/Level)                 |              |                        |
| busy_____ | 1:                                | 440/-17.25__ | Duration (msec): 200__ |

|           | 6:                                | goto_____    | step: 3_               |
|           | 7:                                | _____        |                        |
|           | 8:                                | _____        |                        |
|           | 9:                                | _____        |                        |
|           | 10:                               | _____        |                        |
|           | 11:                               | _____        |                        |
|           | 12:                               | _____        |                        |
|           | 13:                               | _____        |                        |
|           | 14:                               | _____        |                        |
|           | 15:                               | _____        |                        |

Screen 5-136. System Parameters Country-Options form (page 2 of 7)

- **Tone Name** — Enter one of the keywords below to indicate which of the individually administrable tones this screen modifies. This field (with its associated `Tone (Frequency/Level)`, `Duration`, and `Step` fields) is meaningful only if the system tone detector is a TN780, vintage 4 or a TN2182. If this field is blank, all entries in the corresponding `Frequency` and `Duration` fields are ignored. Default is blank.

Acceptable keywords are:

- 1-call-wait
  - 2-call-wait
  - 3-call-wait
  - busy
  - call-wait-ringback
  - conference
  - confirmation
  - disable-dial
  - hold
  - intercept
  - intrusion
  - PBX-dial
  - recall-dial
  - reorder
  - rep-confirmation
  - ringback
  - secondary-dial
- **Cadence Step** — This is a display-only field that identifies the number (1 through 15) of each tone cadence step.
  - **Tone (Frequency/Level)** — Enter **silence**, **goto**, or a set of values to specify the frequency and level of the tone. An entry of **silence** means no tone; an entry of **goto** means to repeat all or part of the sequence, beginning at the specified cadence step. A final step of **silence** with an infinite duration will be added internally to any tone sequence that does not end in a **goto**. Default is blank.

In addition to **silence** and **goto**, the following is a list of acceptable numeric value sets for the tone field:

- 350/-17.25
- 350+425/-4.0
- 350+440/-13.75
- 375+425/-15.0
- 404/-11.0
- 404/-16.0
- 404+425/-11.0
- 404+450/-11.0

5 Basic Forms

System Parameters Country-Options

Page 5-275

- 425/-4.0
- 425/-11.0
- 425/-17.25
- 440/-17.25
- 440+480/-19.0
- 480/-17.25
- 480+620/-24.0
- 525/-11.0
- 620/-17.25
- 697/-8.5
- 770/-8.5
- 852/-8.5
- 941/-8.5
- 1000/0.0
- 1000/+3.0
- 1004/0.0
- 1004/-16.0
- 1209/-7.5
- 1336/-7.5
- 1400/-11.0
- 1477/-7.5
- 1633/-7.5
- 2025/-12.1
- 2100/-12.1
- 2225/-12.1
- 2804/-16.0
- goto
- silence

- **Duration (msec)** — Enter blanks or a value between **50** through **12750**, in increments of 50, to describe the duration of each administered tone. There is one dynamic Duration field associated with each of the 15 Tone (Frequency/Level) fields on each screen page. Initially, when Tone is blank, this field does not appear. However, when a non-blank value other than **goto** is entered in a Tone field, the associated Duration field appears, and must be used to specify the duration (in milliseconds) of the specified tone. Default is blank.

- **Step** — Enter blanks or a Cadence Step (**1** through **14**) beginning the repeated sequence for a "goto" entry. There is one dynamic Step field associated with each of the 15 Tone (Frequency/Level) fields shown on a screen page. Initially, when Tone is blank, this field does not appear. However, when "goto" is entered in a Tone field, the associated Step field appears, and must be used to specify the cadence step to begin repeating from. Default is blank.

## System Parameters Customer-Options

This form sets optional, system-wide parameters. An authorized Lucent Technologies representative sets these parameters for you. ISDN trunks support QSIG Multivendor Connectivity, while ISDN-BRI supports QSIG.

### Administration commands

Use the following commands to administer this form.

| Action  | Object                             | Qualifier <sup>1</sup>  |
|---------|------------------------------------|-------------------------|
| change  | system-parameters customer-options | —                       |
| display | system-parameters customer-options | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

```

- **G3 Version** — Identifies the version of DEFINITY ECS being used. (V1.1, V2, V3, V4, V5, V6 per contract)
- **Maximum Ports** — Number of ports active, per contract.
- **Abbreviated Dialing Enhanced List** — Provides the capability to store and retrieve dialing lists that simplify or eliminate dialing. You dial an abbreviated code or depress an assigned button. The stored entries are organized in number lists. There are three types of number lists: personal, group, and enhanced.
- **Access Security Gateway** — Provides an additional level of security for remote access.
- **A/D Grp/Sys List Dialing Start at 01** — Allows you to number Abbreviated Dialing group or system lists like the DEFINITY G2 system.
- **Analog Trunk Incoming Call ID** — Displays only if **G3 Version** is **V6** or later. This field displays the name and number of an incoming call. Valid entries are **y** and **n** (default).
- **Answer Supervision by Call Classifier** — Set this field to **y** if the system contains a call-classifier circuit pack. This circuit pack detects tones and voice-frequency signals on the line and determines whether a call has been answered.
- **ARS** — Provides access to public and private communications networks. Long-distance calls can be routed over the best available and most economical routes. Provides partitioning of ARS routing patterns.
- **ARS/AAR Partitioning** — Provides the ability to partition AAR and ARS into 8 user groups within a single DEFINITY ECS. Can establish individual routing treatment for each group.
- **ASAI Interface** — Provides linkage between DEFINITY ECS and adjuncts. CallVisor ASAI improves the call handling efficiency of ACD agents and other system users by allowing an adjunct to monitor, initiate, control, and terminate calls on the switch.
- **ASAI Proprietary Adjunct Links** — Provides linkage between DEFINITY ECS and adjuncts.
- **Asynch. Transfer Mode (ATM) PNC** — Set this field to **y** to enable port network connectivity (PNC). With this configuration, the processor port network (PPN) is to be connected to expansion port networks (EPNs) via an ATM switch.

ATM PNC can be enabled (this field accepts a **y**) only if:

- the **G3 Version** field is set to **V6**
- all prior fiber-link administration has been removed
- all “switch-node” and “dup-switch-node” carrier types have been removed

Once ATM PNC is enabled, it can be disabled (this field accepts an **n**) only if all atm pnc connections have been removed.

- **Asynch. Transfer Mode (ATM) Trunking** — Set this field to **y** to enable circuit emulation service (CES). With this configuration, multiple ISDN-PRI T1 or E1 trunks can be emulated on one ATM pipe. A **y** is accepted only if the G3 Version field is set to **V6** and the ISDN-PRI field is set to **y**.
- **ATMS** — Provides for voice and data trunk facilities to be measured for satisfactory transmission performance.
- **Audible Message Waiting** — Provides audible message waiting.
- **Authorization Codes** — Permits you to selectively specify levels of calling privileges that override in-place restrictions. In addition to facilities access, authorization codes are used for unique identification for billing security purposes. Authorization codes can be 4-to-7 digits.
- **CAS Branch** — Provides Centralized Attendant Service - Branch. See CAS Main for more information.
- **CAS Main** — Provides multi-location switch customers served by separate switching vehicles to concentrate attendant positions at a single main DEFINITY ECS location. The main DEFINITY ECS is served by an attendant queue that collects calls from all locations (main and branch). Each branch location switches all of its incoming calls to the centralized attendant positions over release link trunks (RLTs). The calls are then extended back to the requested extension at the branch PBX over the same RLT. When the call is answered, the trunks to the main switch are dropped and can be used for another call.
- **Cvg Of Calls Redirected Off-net** — Provides basic telecommuting capability for Coverage of Calls Redirected Off-Net.
- **DCS (Basic)** — Provides transparent operation of selected features across a Distributed Communications System (DCS). Users on one switch can use features located on another switch. Includes 4- and 5-digit uniform dialing and 1–4 digit steering. To invoke DCS with Rerouting, enter **y**.
- **DCS Call Coverage** — Provides DCS-based transparency of the call coverage feature across a DCS network of switches.
- **DCS with Rerouting** — Provides for rerouting calls transferred among DCS nodes, enabling rerouting of the call for more effective use of facilities. Valid entries are **y** and **n** (default). To set value to **y**, enable ISDN-PRI (on page 2) and DCS (Basic).
- **DEFINITY G3 Network Admin** — Indicates the switch is accessible by DEFINITY Network Administration. Valid entries are **y** and **n** (default).
- **DS1 MSP** — Provides the ability to change fields on DS1 circuit pack form without removing the related translations of all trunks from the trunk group.
- **Emergency Access to Attendant** — Provides for emergency calls to be placed to an attendant. These calls can be placed automatically by DEFINITY ECS or dialed by users.

- **Extended Cvg/Fwd Admin** — Provides basic telecommuting package capability for Extended User Administration of Redirected Calls.
- **External Device Alarm Admin** — Provides for analog line ports to be used for external alarm interfaces. Allows identification of port location, adjunct associated with port location, and the alarm level to report.
- **Flexible Billing** — Provides an internationally accepted standard interface for end-to-end digital connectivity. Used with a T1 interface and supports twenty-three 64-KBPS voice or data B-Channels and one 64-Kbps signaling D Channel for total bandwidth of 1.544 Mbps.
- **Forced Entry of Account Codes** — Allows system administration to force account users to enter account codes based on user or trunk class of restriction, or by an option on the Toll Analysis table. FEAC provides an easy method of allocating the costs of specific calls to the correct project, department, etc. Enter account code length up to 15 digits that appears on the CDR report for applicable calls.
- **Global Call Classification** — Provides call classification outside of North America. Listens for tones and classifies tones detected. Required for Call Coverage Off Net and Outgoing Call Management.
- **Hospitality (Basic)** — Provides access to basic features including: Attendant Crisis Alert, Attendant Room Status, Automatic Wakeup, Do Not Disturb, Names Registration, Single-Digit Dialing, and Mixed Station Numbering.
- **Hospitality (G3R5 Enhancements)** — Software required for Property Management System and Automatic Wakeup. Property Management System Interface activates Forward PMS Messages to INTUITY Lodging and PMS Protocol Mode (transmit in ASCII mode). Usage Note: standard hospitality features are included in basic system software.

Screen 5-138. System Parameters, Customer Options form (page 2 of 5)

- **ISDN-BRI Trunks** — Provides the capability to add ISDN-BRI trunks to the switch. The ISDN-BRI Trunk circuit pack form is accessible only if this option is **y**. If **n**, the ISDN-BRI Trunk circuit pack form is not accessible even if ISDN-PRI is **y**. If enabled, can add isdn trunk groups and the following forms are accessible:
  - network-facilities
  - private-numbering
  - public-unknown-numbering
- **ISDN-PRI** — Provides Integrated Services Digital Network (ISDN-PRI) software for either a switch-hardware platform migration only or a switch-hardware platform migration in combination with a software version upgrade.
- **ISDN-PRI over PACCON** — Same as ISDN-PRI.
- **Malicious Call Trace** — Provides ability to retrieve certain information related to a malicious call.
- **Mode Code Interface** — Allows you to use the Mode Code Voice Mail System Interface to connect the switch over a DTMF interface to INTUITY AUDIX or other vendors' voice mail systems.
- **Multifrequency Signaling** — Provides for a form of number signaling used between the switch and the central office. Default is **y**.

- **Multimedia Appl. Server Interface (MASI)** — Allows users of the Multimedia Communications Exchange (MMCX) to take advantage of certain DEFINITY ECS telephony features.
- **Multimedia Call Handling (Basic)** — Allows administration of desktop video-conferencing systems as data modules associated with DEFINITY ECS voice stations in a multimedia complex. Users can dial one number to reach either endpoint (voice or data) in the complex.
- **Multimedia Call Handling (Enhanced)** — Allows a multifunction voice terminal to control a multimedia call like a standard voice call.
- **Personal Station Access (PSA)** — Provides basic telecommuting package capability for Personal Station Access.
- **PNC Duplication** — Enter **y** to enable PNC duplication for the critical reliability configuration with port network connectivity. When upgrading from high to critical reliability, one of the two duplicated PNC connections (PPN-to-ATM or PPN-to-CSS) must be removed before PNC duplication can be enabled.
- **Processor and System MSP** — Provides for maintaining processor and system circuit packs.
- **Private Networking** — Upgrades PNA or ETN software RTU purchased with earlier systems.
- **Restrict Call Forward Off Net** — The system can monitor the disposition of an off-call and, if it detects busy, bring the call back for further processing, including call coverage.
- **Secondary Data Module** — Provides ability to use any data module as a secondary data module.
- **Station and Trunk MSP** — Provides for maintaining station and trunk circuit packs.
- **Tenant Partitioning** — Provides for partitioning of attendant groups and/or stations and trunk groups. Typically this is used for multiple tenants in a building or multiple departments within a company or organization.
- **Terminal Trans. Init. (TTI)** — Allows administrators of Terminal Translation Initialization (TTI) to merge an Administered Without Hardware (AWOH) station to a valid port by dialing a system-wide TTI security code and the extension from a terminal connected to that port.
- **Time of Day Routing** — Provides AAR and ARS routing of calls based on the time of day and day of the week. You can take advantage of lower calling rates during specific times.
- **Uniform Dialing Plan** — Provides 4- or 5-digit Uniform Dial Plan (UDP) and 1-4 digit steering. Also allows you to use Extended Trunk Access and Extension Number Portability features.
- **Usage Allocation Enhancements** — Provides for assigning ISDN-PRI or ISDN-BRI Services/Features for Usage Allocation Plans. `ISDN-PRI` or `ISDN-BRI Trunks` must be enabled before using this enhancement.

- **Wideband Switching** — Provides wideband data software for switching video or high-speed data. You can aggregate DSO channels up to the capacity of the span. Wideband supports H0, H11, and H12 standards, where applicable, as well as customer-defined data rates.
- **Wireless** — Provides right to use for wireless applications in certain Network Systems sales. You may purchase it from Lucent Technologies Network Wireless Systems.

| Reason Codes? n                        | VuStats (G3V4 Enhanced)? n           |

Screen 5-139. Call Center Optional Features form (page 3 of 5)

- **Logged-In ACD Agents** — Number of ACD Agents contracted for. Use this field to limit the number of logged-in ACD agents to a number no more than the maximum supported by the system hunt-group-member capacity of the hardware configuration.

The limit applies to ACD agents on ACD and EAS calls. Auto-Available Split (AAS) agent ports are counted when they are assigned. AAS split or skill members are also counted. If the port for an AAS split/skill member is logged out, (for example, when a ringing call is redirected) the logged-in agent count is not updated. These counts are updated only during administration.

- **ACD** — Provides the software required for the Call Center Basic, Plus, Deluxe, and Elite features by all call center features for up to the number of agents specified. Automatic Call Distribution (ACD) automatically distributes incoming calls to specified splits or skills.

- **BCMS (Basic)** — Provides real-time and historical reports about agent, ACD split, Vector Directory Number (VDN) and trunk group activity.
- **BCMS/VuStats LoginIDs** — Allows you to administer valid agent login IDs to monitor call activity by agent. This feature can be used when EAS is not optioned, or in addition to EAS login IDs. When this field is **y**, both BCMS and CMS use the same login ID for an agent.
- **BCMS/VuStats Service Level** — Allows you to set up hunt groups or Vector Directory Numbers (VDNs) with an acceptable service level. An acceptable service level defines the number of seconds within which a call must be answered to be considered acceptable.
- **Call Work Codes** — Allows agents to enter digits for an ACD call to record customer-defined events such as account codes or social security numbers.
- **CentreVu<sup>®</sup> Advocate**— Software that provides an integrated set of advanced features to optimize call center performance. For information on CentreVu<sup>®</sup> Advocate, contact your Account Executive.
- **DTMF Feedback Signals For VRU** — Provides support for the use of C and D Tones to VRUs.
- **EAS-PHD** — Increases the number of skills an agent can log in to from four to 20. Increases the number of agent skill preference levels from two to 16.
- **Expert Agent Selection (EAS)** — Provides skills-based routing of calls to the best-qualified agent.
- **Forced ACD Calls** — See *Multiple Call Handling*.
- **Lookahead Interflow (LAI)** — Provides Look-Ahead Interflow to balance the load of ACD calls across multiple locations.
- **Multiple Call Handling (On Request)** — Allows agents to request additional calls when active on a call.
- **Multiple Call Handling (Forced)** — Forces an agent to be interrupted with an additional ACD call while active on an ACD call. Splits or skills can be one forced, one per skill, or many forced.
- **PASTE (Display PBX Data on Phone)** — Provides an interface between the display of a DCP telephone set and PC-based applications.
- **Reason Codes** — Allows agents to enter a numeric code that describes their reason for entering the AUX work state or for logging out of the system.
- **Service Observing (Basic)** — Allows a specified user to observe an in-progress call on a listen-only or listen-and-talk basis.
- **Service Observing (Remote/By FAC)** — Allows users to service observe calls from a remote location or a local station using this feature's access codes.

- **Service Observing (VDNs)** — Provides the option of observing and/or monitoring another user's calls.
- **Timed ACW** — Places an auto-in agent in ACW for an administered length of time after completion of the currently active ACD call.
- **Vectoring (Basic)** — Provides basic call vectoring capability.
- **Vectoring (Prompting)** — Allows flexible handling of incoming calls based on information collected from the calling party or from an ISDN-PRI message.
- **Vectoring (G3V4 Enhanced)** — Allows for the use of enhanced comparators, wildcards in digit strings for matching on collected digits and ANI or II-digits, use of Vector Routing Tables, multiple audio/music sources for use with wait-time command and priority level with the oldest-call-wait conditional.
- **Vectoring (ANI/II-Digits Routing)** — Provides for ANI and II-Digits vector routing.
- **Vectoring (G3V4 Advanced Routing)** — Provides for Rolling Average Speed of Answer Routing, Expected Wait Time Routing, and VDN Calls Routing.
- **Vectoring (CINFO)** — Provides the ability to collect ced and cdpd from the network for vector routing. Requires ISDN trunks.
- **Vectoring (Best Service Routing)** — Enables the Best Service Routing™ feature. Through special vector commands, Best Service Routing allows you to compare splits or skills at local and remote locations and queue a call to the resource that will give the caller the best service.
- **VDN of Origin Announcement** — Provides a short voice message to an agent indicating the city of origin of the caller or the service requested by the caller based on the VDN used to process the call.
- **VDN Return Destination** — Allows an incoming trunk call to be placed back in vector processing after all parties, except the originator, drop.
- **VuStats** — Allows you to present BCMS statistics on voice terminal displays.
- **VuStats (G3V4 Enhanced)** — Allows you to use the G3V4 VuStats enhancements including historical data and thresholds.

QSIG OPTIONAL FEATURES

Basic Call Setup? n  
Basic Supplementary Services? n  
Interworking with DCS? n  
Supplementary Services with Rerouting? n

### Screen 5-140. QSIG Optional Features form (page 4 of 5)

- **Basic Call Setup** — Provides basic QSIG services: basic connectivity and calling line ID number.
- **Basic Supplementary Services** — Provides QSIG Supplementary Services:
  - Name ID.
  - Transit Capabilities; that is, the ability to tandem QSIG information elements.
  - Support of Notification Information Elements for interworking between QSIG and non-QSIG tandemed connections.
  - Call Forwarding (Diversion) by forward switching. No reroute capabilities are provided.
  - Call Transfer by join. No path replacement capabilities are provided.
- **Interworking with DCS** — This field is reserved for future functionality.
- **Supplementary Services with Rerouting** — Provides QSIG Supplementary Services:
  - Name ID.
  - Transit Capabilities; that is, the ability to tandem QSIG information elements.
  - Support of Notification Information Elements for interworking between QSIG and non-QSIG tandemed connections.
  - Call Forwarding (Diversion) by forward switching. In addition, reroute capabilities are provided.
  - Call Transfer by join. In addition, path replacement capabilities are provided.

ASAI CAPABILITY GROUPS

Adjunct Call Control? y
Adjunct Routing? y
Domain Control? y
Event Notification? y
Request Feature? y
Set Value? y

ASAI OPTIONAL FEATURES

Answering Machine Detection? y
Selective Listening? n
Switch Classified Outbound Calls? y
```

Screen 5-141. ASAI Capability Groups form (page 5 of 5)

- **Adjunct Routing** — Allows the associated adjunct to provide adjunct routing information to the switch for incoming calls.
- **Domain Control** — Allows an adjunct to control calls and receive event reports for station sets and to receive login and logout event reports for adjuncts in a given ACD split.
- **Event Notification** — Allows the associated adjunct to request incoming call notification and enables the switch to send event reports about such calls.
- **Request Feature** — Allows the associated adjunct to request features such as change work modes, login, logout, sac, and fwd.
- **Set Value** — Allows the adjunct to request status changes for Message Waiting lamps (that is, control of the on/off state of the lamps) and billing changes for 900-type call within Flexible Billing.

**NOTE:**

To request status changes to flexible billing, set `Flexible Billing` to `y` on page 1 of the System-Parameters Customer-Options form.

For CallVisor ASAI adjuncts, you can assign an alarm severity option to each of the following categories via the **set options** command:

- Major on-board ASAI adjunct alarms
- Major off-board ASAI adjunct alarms
- Minor on-board ASAI adjunct alarms
- Minor off-board ASAI adjunct alarms

See *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6 and later* or *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6vs/si and later* or *DEFINITY Enterprise Communications Server Release 6 Maintenance for R6/csi/si and later* for information on using the `set options` command.

For international Outbound Call Management applications, you may need to complete the System Parameters OCM Call Classification form.

## CallVisor ASAI Optional Features

In addition to ASAI capability groups on the System-Parameters Customer-Options form there are ASAI optional features, which are described below. Except for `Switch Classified Outbound Calls`, all options default to `n`.

- **Answering Machine Detection** — Used by the adjunct for predictive Outbound Call Management.
- **Selective Listening** — Consists of two capabilities, Third Party Listen Disconnect and Third Party Listen Reconnect. Listen Disconnect allows the adjunct to disconnect selected listening paths on an active call. Listen Reconnect allows the adjunct to reconnect disconnected listening paths.
- **Switch Classified Outbound Calls** — Enter either `y` or `n` to enable or disable predictive dialing in the switch.

When you enable the CallVisor ASAI option(s), the following capabilities are automatically enabled, regardless of the groups selected: Value Query (includes Response Continued Capability), Abort, Heart Beat, Restart Procedure, Suspend/Resume Alarm.

### NOTE:

You must logoff and login to effect the permission changes.

## System Parameters OCM Call Classification

This form enters the tone characteristics for your country for Outbound Call Management (OCM) applications. It is not required for United States OCM applications. If you cannot access this form, contact your Lucent Technologies representative.

| _____     | _____    | _____           | 1. on        | _____            | _____            |
|           |          |                 | 2. off       | _____            | _____            |
|           |          |                 | 3. on        | _____            | _____            |
|           |          |                 | 4. off       | _____            | _____            |
|           |          |                 | 5. on        | _____            | _____            |
|           |          |                 | 6. off       | _____            | _____            |
|           |          |                 | 7. on        | _____            | _____            |
|           |          |                 | 8. off       | _____            | _____            |

### Screen 5-143. System Parameters OCM Call Classification form (page 2 of 9)

**Global Classifier Adjustment (dB):** — Enter a number in the range 0 – 15 to specify the dB loss adjustment. Default is 0.

**USA Default Algorithm?** — Enter **y** to use the default United States tone detection set. If you enter **n**, the USA SIT Algorithm? field appears.

**USA SIT Algorithm?** — Enter **y** to use the United States Special Information Tones (SIT) tone characteristics for SIT tone detection.

If you enter **n**, the system treats tones with the administered tone name “intercept” as if they were SIT VACANT, and treats tones with the administered tone name “information” as if they were SIT UNKNOWN.

**Tone Name** — Enter the name of the tone that you are adding or modifying. Possible values are: **busy**, **information**, **intercept**, **reorder**, and **ringback**. This field is required for tone definition outside of the US and Canada.

**Instance** — Enter the instance number of the tone. The instance number distinguishes tones that have the same use but more than one definition of silence and tone-on characteristics. If the system identifies a tone that matches the characteristics defined on more than one page of this form the system applies the tone definition from the earlier page.

**Tone Continuous** — Enter **y** to indicate a continuous tone or **n** to indicate a non-continuous tones. If you enter **y** to indicate a continuous tone, you will not be able to enter data in the duration fields.

**Cadence Step** — The display-only field identifies the number of each tone cadence step, and indicates whether the tone is on or off during this cadence step.

**Duration Minimum** — Specify the lower limit in milliseconds of the tone duration. Enter a value between **75** and **6375** milliseconds in increments of 25.

**Duration Maximum** — Specify the upper limit in milliseconds of the tone duration. Enter a value between **75** and **6375** milliseconds in increments of 25.

 **NOTE:**

Set Feature-Related System Parameters Off-Premises Tone Detect Timeout Interval to its maximum value.

## Telecommuting Access

This form allows the System Administrator to administer the extension which allows remote users to use the feature.

### Administration commands

The table below provides the commands and command syntax for administering the Telecommuting Access form.

| Action  | Object               | Qualifier <sup>1</sup> |
|---------|----------------------|------------------------|
| add     | telecommuting-access |                        |
| change  | telecommuting-access |                        |
| display | telecommuting-access | x[print or schedule]   |
| remove  | telecommuting-access |                        |

1. Brackets [ ] indicate the qualifier is optional.

The List Extension-Type command will show you the extension assigned to the Telecommuting Access feature.

### Form instructions

Make assignments as required for the following fields on the form:

#### Page 1 of the Telecommuting Access form

TELECOMMUTING ACCESS

Telecommuting Access Extension: \_\_\_\_\_

#### Screen 5-144. Telecommuting Access — Default form (page 1)

**Telecommuting Access Extension** — The default for this field is blank. That means that no extension is assigned and that no one can use the Telecommuting Access feature. To allow remote access to the Telecommuting Access feature only, enter an extension that conforms to your system's dial plan and which is not assigned to any other system object. If you need to restrict feature use, enter blanks.

## Tenant

---

This form defines tenants to the system. Page one of this form requires that you provide tenant group information and allows you to provide TAAS alert and night destination information. Page 2 of this form lets you establish calling permission from this tenant to all other tenants; this tenant can also call itself.

### Administration commands

---

You can use the change and display commands to administer the Tenant Partitioning form. The syntax for executing these commands is provided below:

| Action  | Object | Qualifier <sup>1</sup> |
|---------|--------|------------------------|
| change  | tenant | x                      |
| display | tenant | x[print or schedule]   |

1. Brackets [ ] indicate the qualifier is optional.

### Form instructions

---

Make assignments as required for the following fields on each page of the form:

#### Page 1 of the Tenant form

Tenant 18

Tenant Description: \_\_\_\_\_

Attendant Group: 1

Ext Alert Port (TAAS): \_\_\_\_\_ Ext Alert (TAAS) Extension: \_\_\_\_\*

Night Destination: \_\_\_\_\_

Music Source: 1

#### Screen 5-145. Tenant — Default form (Tenant 18) (page 1)

**Tenant** — This is a display only field. It contains the tenant number that you entered on the command line.

**Tenant Description** — You can provide a description of up to 40 characters of alpha-numeric information. You may leave the description field blank, but future administration will be easier if you provide descriptive information.

**Attendant Group** — You must enter this information which relates a tenant to an attendant group. See *DEFINITY Enterprise Communications Server Release 6 System Description Pocket Reference*, for your system's range of allowable attendant group numbers. Default is 1.

 **NOTE:**

The default for the system is that all attendant groups exist. However, the attendant group will be empty if no consoles are assigned to it.

**Ext Alert Port (TAAS)** — Enter TAAS alert port information, if any. Enter the port number or **X**. The circuit pack must be installed and defined to the system before you can refer to it here. The port type and the object type must be consistent, and the port can be assigned to only one tenant. The port information for this 7 character field is constructed as follows:

| Characters | Meaning        | Value         |
|------------|----------------|---------------|
| 1-2        | Cabinet Number | 01 through 03 |
| 3          | Carrier        | A through E   |
| 4-5        | Slot Number    | 00 through 20 |
| 6-7        | Circuit Number | 01 through 31 |

**Ext Alert (TAAS) Extension** — This field appears only if you have entered an **X** in `Ext Alert Port (TAAS)`. You must enter a valid, numeric extension number that has not been previously assigned. If you have specified an **X** in `Ext Alert Port (TAAS)`, you must enter extension information in this field.

**Night Destination** — Enter the night service station extension, if you want night service for this tenant. Enter a valid, numeric station extension number. The extension number must have already been defined to the system.

**Music Source** — Enter the music/tone source for the partition. Default is 1.

### Page 2 of the Tenant form

10? n  20? n
```

Screen 5-147. Tenant — Default form (Tenant 18 - R5vs/si and later) (page 2)

**Tenant** — This is a display only field. It contains the tenant number that you entered on the command line.

Enter **y** to establish calling permission between the tenant number that you entered on the command line and any other tenant. Enter **n** to turn off calling permission. System default allows each tenant to call only itself and Tenant 1; default for all other tenants is **n**.

## Terminating Extension Group

---

This form defines Terminating Extension Groups (TEGs). Any voice terminal can be assigned as a TEG member; however, only a multi-appearance voice terminal can be assigned a TEG button with associated status lamp. The TEG button allows the terminal user to select a TEG call appearance for answering or for bridging onto an existing call.

The TEG members are assigned on an extension number basis. Call reception restrictions applicable to the group are specified by the group class of restriction (COR). The group COR takes precedence over an individual member's COR. The members could all be termination restricted but still receive calls if the group is not restricted.

The system allows for as many as 32 TEGs with up to 4 members each. An extension number can be assigned to more than one TEG but can have only one appearance of each group.

### Administration commands

---

Use the following commands to administer this form. In some cases, just the most commonly used commands are shown. See [Appendix B, "Administration Commands"](#), for a complete listing of all administration commands, the command structure, and the use of abbreviated command words when entering a command.

| Action  | Object         | Qualifier <sup>1</sup>   |
|---------|----------------|--|
| add     | term-ext-group | 1-32 (or 'next')   |
| change  | term-ext-group | 1-32   |
| display | term-ext-group | 1-32 ['print' or 'schedule']   |
| list    | term-ext-group | [1-32]['number' x]['to-number' x]['name' x]['ext' x]<br>['to-ext' x]['count' n]['print' or 'schedule'] |
| remove  | term-ext-group | 1-32   |

---

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

## Form instructions

```

Screen 5-148. Terminating Extension Group form (page 1 of 1)

Make assignments as required for the following fields on the form:

- **Group Number** — Enter a group number from 1 through 32 when completing a paper form. This is a display-only field when the form is accessed using an administration command such as **add** or **change**.
- **Group Extension** — Enter an unused extension number (may not be a VDN extension) consisting of two to five digits (do not leave blank).
- **Group Name** — Enter up to 27 characters to identify the group.
- **Coverage Path** — Enter a number for the call coverage path for this group. (A TEG cannot serve as a coverage point; however, calls to a TEG can redirect to coverage).
- **Security Code** — Enter a 4-digit security code or leave blank. This code is used for the Demand Print feature.
- **COR** — Enter the desired class of restriction (COR) number (**0** through **95**) that reflects the desired restrictions. Default is **1**.
- **TN** — Enter the Tenant Partition number. Default is **1**.
- **ISDN Caller Display** — Enter **grp-name** or **mbr-name** to specify whether the TEG group name or member name (member of TEG where call terminated) will be sent to the originating user. This field is required if ISDN-PRI or ISDN-BRI Trunks is enabled on the System-Parameters Customer-Options form. If ISDN-PRI or ISDN-BRI Trunks is not enabled, leave blank.
- **LWC Reception** — Defines the source for Leave Word Calling (LWC) messages. Enter **audix**, **msa-spe**, or **none**.
- **AUDIX Name** — Only displays for an R5r and later configuration. Name of the AUDIX machine as it appears in the Adjunct Names form.

- **Messaging Server Name** — Only displays for an R5r and later configuration. Name of the server as it appears in the Adjunct Names form.
- **Group Member Assignments — Ext** — Enter the extension number (may not be a VDN extension) for the members of this group.
- **Group Member Assignments — Name** — Make no entry. The name is assigned to the preceding extension number when the TEG member's voice terminal is administered.

## Time of Day Coverage Table

This form allows a user to specify the coverage path to be in effect for a five time and day of the week. The user can specify up to five different lead coverage paths, associated with five different time ranges, for each day of the week. Only one lead coverage path can be in effect at any one time.

### Administration commands

Use the following commands to administer the Time of Day Call Coverage Table.

| Action  | Object               | Qualifier |
|---------|----------------------|-----------|
| add     | coverage time-of-day | 1 to 999  |
| change  | coverage time-of-day | 1 to 999  |
| display | coverage time-of-day | 1 to 999  |
| remove  | coverage time-of-day | 1 to 999  |

Screen 5-149. Time of Day Coverage Table (page 1 of 1)

Make assignments as required for the following fields on the form:

- **Act Time** — Specify the activation time of the lead coverage path administered in the next CVG PATH field. Enter the information in 24-hour time format; valid entries are **00:01** to **23:59** or blank. If there are time gaps in the table, there will be no coverage path in effect during those periods. The first activation time for a day is set to 00:00 and cannot be changed. Activation times for a day must be in ascending order from left to right.
- **CVG Path** — Enter the coverage path number. Valid entries are **1** through **9999** for the R5r and later configurations and **1** through **999** for the R5vs/i and later configurations.

## Toll Analysis

---

### ⇒ NOTE:

The Toll List associated with this form has neither relationship or interaction with the [“ARS Toll Table” on page 8-75](#).

This form associates dialed strings to the System’s Restricted Call List (RCL), Unrestricted Call List (UCL), and Toll List. In addition, dialed strings can be associated with the CDR Forced Entry of Account Codes feature (calls from facilities whose COR is administered to include Forced Entry of Account Codes will be required to include an account code).

### ⇒ NOTE:

To maximize System security, it is recommended that toll calling areas be restricted as much as possible through the use of the RCL (Restricted Call List) and Toll List fields on this form.

## Administration commands

---

Use the following commands to administer the Toll Analysis form.

| Action  | Object                        | Qualifier <sup>1</sup>   |
|---------|-------------------------------|--|
| change  | toll                          | Enter digits between 0-9, ‘x’, or ‘X’ [‘min’ 1-23]                         |
| display | toll                          | Enter digits between 0-9, ‘x’, or ‘X’ [‘min’ 1-23] [‘print’ or ‘schedule’] |
| list    | toll toll-list                | [‘start’ dialed-string] [‘count’ (1-1000)] [‘print’ or ‘schedule’]         |
| list    | toll all                      | [‘start’ dialed-string] [‘count’ (1-1000)] [‘print’ or ‘schedule’]         |
| list    | toll restricted-call          | [‘start’ dialed-string] [‘count’ (1-1000)] [‘print’ or ‘schedule’]         |
| list    | toll unrestricted-call [1-10] | [‘start’ dialed-string] [‘count’ (1-1000)] [‘print’ or ‘schedule’]         |

---

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ‘ ’ ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word may be entered.

Screen 5-150. Toll Analysis form

Make assignments as required for the following fields on the form:

- **Percent Full** — This is a 3-character display-only field. The field displays the percentage of the system memory resources being used. A common pool of memory resources is shared between the ARS/AAR Digit Conversion, ARS/AAR Digit Analysis, and Toll Analysis Tables. If the Percent Full display indicates that the common pool of memory resources is in jeopardy of becoming full (100%), perform any of the following to "free-up" resources:

  - Delete unnecessary entries from any of the shared resources tables.
  - Utilize the RHNPA table for 6-digit ARS routing.
  - Reduce dialed string field entries to the shortest possible length that accomplishes the desired function.
  
- **Dialed String** — Enter up to an 18-character dialed digit string. Valid entries include the digits **0** through **9** and the wildcard character **x** or **X**. The wildcard letter **x** or **X** may be used to substitute for any digit in the string. A Dialed String, when entered, must be associated with at least one RCL, UCL, CDR Forced Entry Account Code (CDR FEAC), or Toll List.
  
- **Min** — Enter the minimum number of digits to collect (1 to 18). The user can actually dial up to 23 digits (match is on first 18). Default is blank.
  
- **Max** — Enter the maximum digits to collect. The value must be greater than or equal to the Min value. Default is blank.

- **RCL** — Enter **x** to assign the Dialed String to the RCL. Default is blank. All entries of **x** and their associated dialed strings are referred to as the System's Restricted Call List. The RCL can be assigned to any COR. A call attempt from a facility whose COR is marked as being associated with the RCL and whose dialed string matches a RCL dialed string field will be denied. The caller receives intercept treatment.
- **Toll List** — Enter **x** to assign the Dialed String to the Toll List. Default is blank. All entries of **x** and their associated dialed strings are referred to as the System's Toll List. The Toll List is a list of dialed strings used for toll restriction analysis.

When a user calls from a facility whose COR has a Calling Party Restriction of **all-toll** or **tac-toll**, the System checks the Toll Analysis form for the user's dialed string. If a match occurs and `Toll List` is **x**, the call will be denied unless the string also is associated with an Unrestricted Call List that is also assigned the facility's COR. See ["Class of Restriction" on page 5-72](#) for definitions of the Calling Party Restrictions. Also see the "Unrestricted Call List" field description for additional information about UCLs.

**NOTE:**

Toll analysis can ignore IXC codes and/or the toll prefix to find a match.

[Table 5-5](#) shows the System's default toll list assignments.

**Table 5-5. Default Toll List Assignments**

| Dialed String | Min | Max | Toll List |
|---------------|-----|-----|-----------|
| 0             | 1   | 23  | x         |
| 1             | 4   | 23  | x         |
| 20            | 10  | 10  | x         |
| 21            | 10  | 10  | x         |
| 30            | 10  | 10  | x         |
| 31            | 10  | 10  | x         |
| 40            | 10  | 10  | x         |
| 41            | 10  | 10  | x         |
| 50            | 10  | 10  | x         |
| 51            | 10  | 10  | x         |
| 60            | 10  | 10  | x         |
| 61            | 10  | 10  | x         |
| 70            | 10  | 10  | x         |
| 71            | 10  | 10  | x         |
| 80            | 10  | 10  | x         |
| 81            | 10  | 10  | x         |
| 90            | 10  | 10  | x         |
| 91            | 10  | 10  | x         |

- **CDR FEAC** — Enter **x** to assign the dialed string to the CDR Forced Entry of Account Code feature. Default is blank. Users who place calls from facilities whose COR is marked as being associated with Forced Entry of Account Codes and whose dialed string matches an CDR FEAC dialed string field will be required to enter an account code before the call will complete.
- **Unrestricted Call List** — Enter **x** in the appropriate field to assign the dialed string to one of the System's Unrestricted Call Lists (UCL). Default is blank for all fields.

**Implementation note**

Entries on the form do not have to be input in a sorted order. Subsequent displays of the form show all entries in a sorted increasing order.

## User Defined Adjunct Names

This form names the AUDIX and Message Server adjuncts.

 **NOTE:**

This form applies to R5r and later configurations only.

### Administration commands

Use the following commands to administer the User Defined Adjunct Names form.

| Action  | Object        |
|---------|---------------|
| change  | adjunct-names |
| display | adjunct-names |

### Form instructions

Page 1 of 1

#### Screen 5-151. User Defined Adjunct Names form

Make assignments as required in the following fields.

- **AUDIX Names** — Enter the names of the AUDIX adjuncts here. Entries can be alphanumeric and up to 7 characters long.
- **Messaging Server Names** — Enter the names of the Messaging Server adjuncts here. Entries can be alphanumeric and up to 7 characters long.

# Voice Terminal, PC Interface, and Data Module Administration

# 6

This section describes how to administer voice terminals, PC interfaces, and data modules.

[“Voice terminals — general”](#) and [“Data Modules — general”](#) begin with general administration details and descriptions of fields that are common to many of the Station or Data Module forms. If a field is unique to only one or two Station or Data Module forms, the field is described with the appropriate terminal or data module. You can also find a description of the Terminal Parameters form at the beginning of the voice terminals section. This form allows you to adjust the system-level parameters for specific voice terminals.

[“PC Interface”](#) describes the DEFINITY EIA interface and the PC interface.

The voice terminal section includes descriptions of the following terminals:

**Table 6-1. Voice terminal descriptions**

| Terminal type   | Page                 |
|---|----------------------|
| 10-MET, 20-MET, and 30-MET voice terminals  | <a href="#">6-41</a> |
| 500, 2500, K2500, 7101A, 7102A, 7103A, 7104A, 8110, DS1FD, DS1SA, and VRU voice terminals | <a href="#">6-47</a> |
| 510D personal terminal and 515 business communications terminal                           | <a href="#">6-55</a> |
| 6402, 6402D, 6408, 6408+, 6408D, 6408D+, 6416D+, 6424D+ voice terminals                   | <a href="#">6-60</a> |
| 7302H, 7303H, and 7305H MERLIN voice terminals  | <a href="#">6-72</a> |

| Processor interface data module | <a href="#">6-246</a> |
| System port data module         | <a href="#">6-248</a> |
| X.25 data module                | <a href="#">6-249</a> |
| 7500 data module                | <a href="#">6-252</a> |
| World Class BRI data module     | <a href="#">6-255</a> |

## Voice terminals — general

Voice terminals combine the capabilities of both a telephone and computer and have a variety of controlling and monitoring capabilities. Voice terminals provide end-users basic telephone service — placing and answering calls — and the ability to activate or deactivate the advanced features of the system. DEFINITY ECS supports both single-line and multiappearance voice terminals.

A single-line voice terminal can have only one incoming call and one virtual call appearing at the terminal at a time. Multiappearance voice terminals can have up to ten call appearances appearing at the terminal at the same time.

(Multiappearance voice terminals can have more call appearances with bridging and adjuncts.) Several of the terminals supported by DEFINITY ECS can display call progress and status information.

### How to administer voice terminals

You assign each voice terminal to your system by administering a Station form. Each Station form requires that you specify the type of voice terminal in the `TYPE` field; this is how you distinguish between the many different types of voice terminals. Use the following administration commands to access the appropriate Station form.

**Table 6-3. Administration commands**

| Action    | Object  | Qualifier   |
|-----------|---------|---|
| add       | station | xxxxx (extension) or ('next')   |
| change    | station | xxxxx (extension)   |
| display   | station | xxxxx (extension) ['print']   |
| duplicate | station | xxxxx (extension) ['start' (start extension)] ['board' (board addr) or 'x'] ['count' (1-16)] ['one-ep'] |
| list      | station | [x (extension)]['ext' x]['to-ext' x]['port' x]['type' x] ['count' n]['print' or 'schedule']             |
| remove    | station | xxxxx (extension)   |

 **NOTE:**

When administering a system that is comprised of a large number of digital voice terminals, 20- and 30-MET terminals, or hybrid terminals equipped with feature buttons, administer the voice terminals in the following order:

1. Digital voice terminals
2. 20-MET and 30-MET terminals

3. Hybrid terminals equipped with feature buttons
4. All others (such as, analog, hybrids, 10-MET, and so on)

[Table 6-4](#) lists the voice terminals and personal computers that you can administer. See the voice terminal descriptions later in this section for complete instructions on administering each terminal type.

To administer terminals that are not in [Table 6-4](#), use Enhanced Terminal Administration (ETA) and its associated Alias Station form.

**Table 6-4. Voice terminals**

| <b>Terminal type</b>                             | <b>Model</b>   | <b>Administer as</b> |
|--|--|----------------------|
| Multibutton electronic telephone (MET) terminals | 10-button (5 administrable) with or without speakerphone | 10MET                |
|  | 20-button (15 administrable)                             | 20MET                |
|  | 30-button (25 administrable)                             | 30MET                |
| Single-line analog                               | 500  | 500                  |
|  | 2500   | 2500                 |
|  | 2500 w/ Message Waiting Adjunct                          | 2500                 |

|                            | 8520T        | 8520T                |
| Personal computer          | 6300/7300    | PC                   |
| (voice/data)               | 6538/9       | Constellation        |
| Test Line                  | ATMS         | 105TL <sup>3</sup>   |
| Key phone system interface | —            | K2500 <sup>4</sup>   |
| ASAI                       |              | ASAI                 |
| ISDN-BRI data module       | 7500         | 7500                 |

1. If administered as 7316H, then Internal Automatic Answer (IAA) works.
2. “asai” is administered as the ISDN-BRI set type in support of an Adjunct Switch Applications Interface (ASAI) link. This interface supports use of CallVisor ASAI and an associated adjunct (such as CONVERSANT speech processor) used with Inbound Call Management.
3. Available without the Automatic Transmission and Measurement System (ATMS) package.
4. K2500 uses the same administration form as the 2500, except it supports rotary or DTMF terminals.

## Terminal Parameters form

---

This form administers system-level parameters and audio levels for the 603 CALLMASTER voice terminals and the 6400-series, 8403, 8405B, 8405B+, 8405D, 8405D+, 8410B, 8410D, 8411B, 8411D, and 8434D terminals.

### NOTE:

Only authorized Lucent Technologies personnel can administer this form.

### Administration commands

---

You can use the following commands to display the Terminal Parameters form. Use the **603/606/302B1** command for the CALLMASTER II/III (603) and CALLMASTER VI (606) voice terminals as well as the 302B1 Attendant Console. Use the **8400** command for the 8400-series voice terminals.

| Action  | Object                            | Qualifier <sup>1</sup>  |
|---------|-----------------------------------|-------------------------|
| display | terminal-parameters 603/606/302B1 | ['print' or 'schedule'] |
| display | terminal-parameters 8400          | ['print' or 'schedule'] |
| display | terminal-parameters 6400          | ['print' or 'schedule'] |

1. Brackets [ ] indicate the qualifier is optional. Single quotes ( ' ' ) indicate the text inside the quote must be entered exactly as shown or an abbreviated form of the word can be entered.

Making a change to this form affects all 603 voice terminals, 606 voice terminals, and 302B1 attendant consoles or all 8400-series voice terminals, depending on whether you are administering the 603/606/302B1 or the 8400-series voice terminals.

A terminal that has not been programmed with the correct parameters may experience incorrect volume levels while a user is on a call or incorrect touchtone levels while the user is placing a call. If you suspect the parameters are incorrect, use the **busyout station/release station** commands to force the currently administered parameters to be sent to the terminal. Use the **status station** command to verify that the download status field indicates the parameters were successfully downloaded.

The switch checks all the 603-, 6400-, and 8400-series terminals each day (during scheduled maintenance) to ensure they are operating with the currently-administered transmission parameters. If the switch detects an

incorrectly-programmed terminal, it automatically attempts to send the correct parameters to the terminal.

**⇒ NOTE:**

Terminals that are off-hook cannot be programmed, and therefore, cannot be corrected until they are on-hook the next time the switch attempts to correct the parameters.

- **Default Parameter Set** — Determines which default set of terminal options and levels will be used. Currently, five default parameter sets (for the USA, Australia, Italy, Netherlands, and the UK) have been defined. All other country codes will automatically map to one of these sets. Enter the correct country code (1 to 19) for your country.

Country codes are shown in [Table 6-5](#).

Table 6-5. Country Codes

| Country Code | Country Name          |
|--------------|-----------------------|
| 1            | United States, Canada |
| 2            | Australia             |
| 3            | Japan                 |
| 4            | Italy                 |
| 5            | Netherlands           |
| 6            | Singapore             |
| 7            | Mexico                |

*Continued on next page*

Table 6-5. Country Codes — *Continued*

| Country Code | Country Name              |

| 22           | Poland                    |
| 23           | Brazil                    |
| etsi         | Europe, New Zealand, etc. |

- **Customize Parameters** — Indicates whether the administrator wishes to change one or more of the default parameters. If this field is **n** (no), the system uses all default parameters associated with the Default Parameter Set. If this field is **y** (yes), the **OPTION** and **LEVEL** fields appear.
- **Display Mode** — Determines how the #) and ~ characters appear on the 603 terminal's display. If this field is set to **1**, the # and ~ do not change. If this field is set to **2**, the 603 terminal displays a # as a British pound sterling symbol and a ~ as a straight overbar. This field only appears if **Customize Parameters** is **y**.
- **DLI Voltage Level** — Determines whether DCP Line Voltage used by the terminals is forced high, for
- ced low, or allowed to automatically adjust. This field only appears if **Customize Parameters** is **y**.

- **Handset Expander Enabled** — Determines whether the terminal will reduce noise on the handset. If the field is **y**, the terminal reduces background noise. This field appears only if `Customize Parameters` is **y**.

### Primary levels

The following fields only appear if `Customize Parameters` is set to **y**. In each case, if the field is blank, the system uses the default setting from the Default Parameter Set. Also, these fields all require the same input; valid entries are from **-44.0** db through **+14.0** db in 0.5 increments (for example, -44.0, -43.5, -43.0 and so on).

- **Voice Transmit (dB)** — Determines the volume of voice outbound from the terminal.
- **Voice Receive (dB)** — Determines the volume of voice inbound to the terminal.
- **Voice Sidetone (dB)** — Determines the volume of voice fed back from the handset voice microphone to the user's ear.
- **Touch Tone Sidetone (dB)** — Determines the touchtone volume fed back from the terminal when a users presses a button.
- **Touch Tone Transmit (dB)** — Determines the touchtone volume fed outbound from the terminal.

### ⇒ NOTE:

You cannot administer all five of the `Primary Level` fields to +14.0 dB. If you attempt to submit the Terminal Parameters form with all Primary Levels set to +14.0 dB, you receive an error message.

### Adjunct levels

The following fields appear only if you are administering 8400-series terminals and if `Customize Parameters` is **y**. In each case, if the field is blank, the system uses the default setting from the Default Parameter Set. Also, these fields all require the same input; valid input is listed in "Primary levels" above.

**Voice Transmit (dB)** — Determines the volume of voice outbound from the adjunct.

**Voice Receive (dB)** — Determines the volume of voice inbound to the adjunct.

**Voice Sidetone (dB)** — Determines the volume of voice fed back from the handset voice microphone to the user's ear.

**Touch Tone Sidetone (dB)** — Determines the touchtone volume fed back from the terminal when a users presses a button.

## Voice-terminal feature button descriptions

[Table 6-6](#) provides descriptions of the feature buttons that you can administer on multiappearance voice terminals. It also lists the administrable software names and recommended button label names. Display buttons support voice terminals equipped with alphanumeric displays.

Depending on the voice terminal type, you may not be able to administer some feature buttons. The voice terminal type descriptions later in this book include listings of the feature buttons that you can administer for each terminal.

**Table 6-6. Voice-terminal feature button descriptions**

| Button name                                    | Button label        | Description   | Maximum                     |
|--|---------------------|---|-----------------------------|
| abr-prog                                       | AbrvDial<br>Program | Abbreviated Dialing Program Mode: allows users to program abbreviated dialing buttons or to store or change numbers in a personal list or group list associated with the station.   | 1 per station               |
| abr-spchar                                     | AbrvDial<br>(char)  | Abbreviated Dialing Special Character: allows users to enter an associated special character [~, ~m (mark), ~p (pause), ~s (suppress), ~w (wait for dial tone), or ~W (wait forever)] when programming an abbreviated dialing list entry. | 1 each per station          |
| abrdg-app <sup>1</sup><br>(Ext: ____)          | (extension)         | Bridged Call Appearance of an Analog Station: allows the user to have an appearance of a single-line voice-terminal extension.  | Depends on station type     |
| abrv-dial <sup>2</sup><br>(List: __<br>DC: __) | AD                  | Abbreviated Dialing: accesses an associated abbreviated dialing list entry and causes the associated stored number to be dialed.  | 1 per AD list per dial code |
| abrv-ring                                      | AR                  | Manually triggers an Abbreviated or Delayed Transition for calls alerting at an extension   |                             |

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name                        | Button label    | Description   | Maximum           |
|------------------------------------|-----------------|---|-------------------|
| ac-alarm                           | AC Alarm        | Administered Connection Alarm Notification: associated status lamp lights when the number of failures for at least one administered connection has equaled the specified threshold.   | 1 per station     |
| aca-halt                           | Auto-Ckt Assure | Automatic Circuit Assurance ( <i>display button</i> ): allows users of display voice terminals to identify trunk malfunctions. The system automatically initiates a referral call to the terminal when a possible failure occurs. The button is used to activate/deactivate referral calls. | 1 per system      |
| account                            | Acct            | Used to enter Call Detail Recording (CDR) account codes. CDR account codes allow you to associate and track calls according to a particular project or account number.  |                   |
| admin                              | Admin           | Allows users to administer specific features on their own stations.   |                   |
| after-call <sup>3</sup>            | After Call Work | After Call Work Mode: used to remove an agent from ACD call distribution in order for the agent to complete ACD-related activities such as forms completion.  | 1 per split group |
| alrt-agchg                         | Alert Agent     | When an agent has had his split/skill hunt group changed while active on a call, this button blinks to notify the agent of the change.  | 1 per station     |
| alt-frl                            | Alt FRL         | Alternate FRL: activates or deactivates Alternate Facility Restriction Level (AFRL).  | 1 per system      |
| assist <sup>3</sup><br>(Group: __) | Assist          | Supervisory Assistance: used by an ACD agent to place a call to a split supervisor.   | 1 per split group |
| asvn-halt                          | asvn-halt       | Authorization Code Security Violation Notification Call: activates or deactivates call referral when a authorization code security violation is detected.   | 1 per system      |

| Button name                           | Button label                  | Description  | Maximum                         |
|---------------------------------------|-------------------------------|--|---------------------------------|
| atd-qcalls <sup>4</sup>               | AQC                           | Attendant Queue Calls ( <i>display button</i> ): tracks the number of calls in the attendant group's queue and obtains a display of the queue status.  | 1 per station                   |
| atd-qtime <sup>4</sup>                | AQT                           | Attendant Queue Time ( <i>display button</i> ): tracks the calls in the attendant group's queue according to the oldest time a call has been queued, and obtains a display of the queue status.                      | 1 per station                   |
| aut-msg-wt <sup>5</sup><br>(Ext: __)  | Message<br>(name or<br>ext #) | Automatic Message Waiting: associated status lamp automatically lights when an LWC message has been stored in the system for the associated extension (can be a VDN).  | 1 per<br>aut-mst-ext            |
| auto-cback                            | Auto<br>CallBack              | Automatic Call Back: when activated, allows inside user who placed a call to a busy or unanswered voice terminal to be called back automatically when the called voice terminal becomes available to receive a call. | 1 per<br>station                |
| auto-icom <sup>6</sup><br>(Group: __) | Auto (name<br>or ext #)       | Automatic Intercom: places a call to the station associated with the button. The called user receives a unique alerting signal, and a status lamp associated with a Intercom button flashes.                         | 1 per group<br>per dial<br>code |
| auto-in <sup>3</sup><br>(Group: __)   | Auto In                       | Auto-In Mode: allows the user to become automatically available for new ACD calls upon completion of an ACD call.  | 1 per split<br>group            |
| auto-wkup                             | Auto<br>Wakeup                | Automatic Wakeup ( <i>display button</i> ): allows attendants, front-desk users, and guests to request a wakeup call to be placed automatically to a certain extension (may not be a VDN extension) at a later time. | 1 per<br>station                |
| autodial                              | Autodial                      | Allows a user to dial a number that is not part of a stored list.  |                                 |

*Continued on next page*

| cov-msg-rt                           | Covr Msg Retrieve  | Coverage Message Retrieval ( <i>display button</i> ): used to place a covering station into the message retrieval mode for the purposes of retrieving messages for the group                  | 1 per station              |
| cpn-blk                              | CPN Block          | Blocks the sending of the calling party number for a call.  | 1 per station              |
| cpn-unblk                            | CPN Unblock        | Deactivates the blocking for sending the calling party number for a call  | 1 per station              |
| data-ext                             | Data (data ext #)  | Data Extension; used to set up a data call. May be used to pre-indicate a data call or to disconnect a data call. May not be a VDN or ISDN-BRI extension. Not allowed on an ISDN-BRI station. | 1 per data-extension group |
| date-time                            | Date Time          | ( <i>display button</i> ) Displays the current date and time  | 1 per station              |
| delete-msg                           | Delete Message     | ( <i>display button</i> ) Deletes a stored message that is currently on the display.  | 1 per station              |
| dial-icom <sup>8</sup><br>(Grp: ___) | Dial Icom          | Dial Intercom: Accesses the intercom group assigned to the button.  | 1 per group                |
| dir-pkup                             | dir-pkup           | Directed call pickup  |                            |
| directory                            | Integrtd Directory | Directory ( <i>display button</i> ): used to place the station's display in the integrated directory mode.  | 1 per station              |
| disp-chrg                            | Display Charge     | Provides your display terminal with a visual display of accumulated charges on your current telephone call. Used exclusively outside the U.S. and Canada.                                     | 1 per station              |
| disp-norm                            | Local/ Normal      | ( <i>display button</i> ): Toggles between LOCAL display mode (displays time and date) and NORMAL mode (displays call-related data). LED off = LOCAL mode and LED on = NORMAL.                | 1 per station              |

*Continued on next page*

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name        | Button label       | Description  | Maximum       |
|--------------------|--------------------|--|---------------|
| dn-dst             | Do Not Disturb     | Places the user in the do not disturb mode   | 1 per station |
| drop               | Drop               | Allows users to drop calls   |               |
| ds1-alarm          | DS1 (facility)     | DS1 Alarm: associated status lamp lights if an off-circuit pack major, minor, or warning alarm is active on a DS1 circuit pack. Off-board alarms (e.g., loss of signal, slips, misframes) relate to problems on the facility side of the DS1 interface.                          |               |
| exclusion          | Exclusion          | Prevents other users from bridging onto the current call   | 1 per station |
| ext-dn-dst         | Do Not Disturb Ext | Extension — Do Not Disturb ( <i>display button</i> ): used by the attendant console or hotel front desk display terminal to activate do not disturb and assign a corresponding deactivate time to an extension.  | 1 per station |
| flash <sup>9</sup> | Flash              | 1) Allows a station on a trunk call with Trunk Flash to send a Trunk Flash signal to the far end (e.g., Central Office); 2) allows a station on a CAS main call to send a Trunk Flash signal over the connected RLT trunk back to the branch to conference or transfer the call. | 1 per station |
| goto-cover         | Go To Cover        | Go To Coverage: sends a call directly to coverage instead of waiting for the called inside-user to answer.   | 1 per station |
| grp-page           | GrpPg              | Allows users to make announcements to groups of stations by automatically turning on their speakerphones.  |               |
| grp-dn-dst         | Do Not Disturb Grp | Group Do Not Disturb ( <i>display button</i> ): removes a group of users from the do not disturb mode.   | 1 per station |

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name  | Button label                                      | Description  | Maximum                       |
|--|---|--|-------------------------------|
| headset  | Headset   | Signals onhook/offhook state changes to the switch. The green LED is on for offhook state and off (dark) for onhook state.           |                               |
| hunt-ns <sup>10</sup><br>(Grp: ___)                | Hunt Group  | Hunt-Group Night Service: places a hunt-group into night service.  | 3 per hunt group              |
| in-call-id <sup>11</sup><br>(Type: __<br>Grp: ___) | Coverage<br>(group #,<br>type, name,<br>or ext #) | Coverage Incoming Call Identification: identifies the hunt or coverage answer group associated with the current incoming call.       | 1 per group-type<br>per group |
| inspect  | Inspect Mode                                      | ( <i>display button</i> ) Displays the extension of the current ringing call or behind a subsequently-pressed call appearance.       | 1 per station                 |
| int-aut-an   | IntAutoAns  | Internal Auto Answer: conditions any hybrid or digital station to automatically answer incoming internal calls.                      | 1 per station                 |
| last-numb  | LastNumb Dialed                                   | Last Number Dialed: originates a call to the number last dialed by the station.  | 1 per station                 |
| link-alarm <sup>12</sup><br>(link# ___)            | Link Failure<br>(link #)                          | Link Alarm: associated status lamp indicates that a failure has occurred on one of the Processor Interface circuit pack data links.  | 8 per station                 |
| lsvn-halt  | Login SVN   | Login Security Violation Notification: activates or deactivates referral call when a login security violation is detected.           | 1 per system                  |
| lwc-cancel   | Cancel LWC  | Leave Word Calling Cancel: cancels the last leave word calling message originated by the user.                                       | 1 per station                 |
| lwc-lock   | Lock LWC  | Leave Word Calling Lock: locks the message retrieval capability of the display module on the station.                                | 1 per station                 |
| lwc-store  | LWC   | Leave Word Calling Store: leaves a message for the user associated with the last number dialed to return the call to the originator. | 1 per station                 |

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name                            | Button label             | Description  | Maximum           |
|--|--------------------------|--|-------------------|
| major-alm                              | Major Hdwe Failure       | Major Alarm: associated status lamp indicates that a vital system hardware component failed. This type of alarm represents a disruption of overall system performance.                                   | 1 per station     |
| man-msg-wt <sup>13</sup><br>(Ext: ___) | Msg Wait (name or ext #) | Manual Message Waiting: lights a message waiting lamp on the station associated with the button.   | None              |
| man-overid                             | Immediate Override       | Immediate Manual Override ( <i>display button</i> ): used in association with Time of Day Routing to temporarily override the routing plan in effect for the activating user's partitioned group number. | 1 per station     |
| manual-in <sup>3</sup><br>(Group: __)  | Manual In                | Manual-In Mode: prevents the user from becoming available for new ACD calls upon completion of an ACD call by automatically placing the agent in the after call work mode.                               | 1 per split group |
| mct-act                                | MCT Activation           | Malicious Call Trace Activation: sends a message to MCT controller consoles to indicate that a user wants to trace a malicious call.   |                   |
| mct-contr                              | MCTControl               | Malicious Call Trace Control: allows the console to take control of malicious call trace requests. (Must be administered with change-mct-group-extensions)   |                   |
| mf-da-intl                             | Directory Assistance     | Multifrequency Operator International: allows users to call Directory Assistance.  | 1 per station     |
| mf-op-intl                             | CO attendant             | Multifrequency Operator International: allows users to make international calls to the CO attendant.   | 1 per station     |
| mj/mn-alm                              | Major/Minor Hdwe Failure | Minor Alarm: associated status lamp indicates that a system hardware component failed and disrupts service on a limited scale.   | 1 per station     |

*Continued on next page*

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name                            | Button label          | Description  | Maximum       |
|--|-----------------------|--|---------------|
| mm-datacnf                             | MM Datacnf            | Multimedia Data Conference: used to initiate a data collaboration session between multimedia endpoints; requires a button with a lamp. | 1 per station |
| msg-retr                               | Message Retrieve      | Message Retrieval ( <i>display button</i> ): places the station's display into the message retrieval mode.                             | 1 per station |
| mwn-act                                | Message Waiting Act.  | Message Waiting Activation: lights a message waiting lamp on an associated station.  | 1 per station |
| mwn-deact                              | Message Waiting Deact | Message Waiting Deactivation: dims a message waiting lamp on an associated station.  | 1 per station |
| next                                   | Next                  | Next Message ( <i>display button</i> ): steps to the next message when the station's display is in message retrieval mode.             | 1 per station |
| night-serv                             | Night Serv            | Night Service Activation: toggles the system in or out of Night Service mode.  | 1 per station |
| noans-alrt                             | RONA                  | Redirection on No Answer Alert: indicates a Redirection on No Answer timeout has occurred for the split.                               | 1 per split   |
| normal                                 | Normal Mode           | Normal ( <i>display button</i> ): places the station's display into normal call identification mode.                                   | 1 per station |
| per-COline <sup>14</sup><br>(Grp: ___) | CO Line<br>(line #)   | Personal CO Line: allows the user to receive calls directly via a specific trunk.  | 1 per group   |
| pms-alarm                              | PMS Failure           | PMS Alarm: associated status lamp indicates that a failure in the PMS occurred. A major or minor alarm condition raises the alarm.     | 1 per station |
| pr-awu-alm                             | Auto Wakeup Alm       | Automatic Wakeup Printer Alarm: associated status lamp indicates that an automatic wakeup printer interface failure occurred.          | 1 per station |

*Continued on next page*

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name                         | Button label       | Description  | Maximum                      |
|-------------------------------------|--------------------|--|------------------------------|
| pr-pms-alm                          | PMS Ptr Alarm      | PMS Printer Alarm: associated status lamp indicates that a PMS printer interface failure occurred.   | 1 per station                |
| pr-sys-alm                          | Sys Ptr Alarm      | System Printer Alarm: associated status lamp indicates that a system printer (dedicated to Report Scheduler) interface failure occurred.           | 1 per station                |
| print-msgs                          | Print Msgs         | Print Messages: allows users to print messages for any extension by pressing the button and entering the extension and a security code.            | 1 per station                |
| priority                            | Priority Call      | Priority Calling: allows a user to place priority calls or change an existing call to a priority call.   | 1 per station                |
| q-calls <sup>15</sup><br>(Grp: ___) | NQC                | Queue Calls: associated status lamp flashes if a call warning threshold has been reached.  | 1 per hunt group per station |
| q-time <sup>15</sup><br>(Grp: ___)  | OQT                | Queue Time: associated status lamp flashes if a time warning threshold has been reached.   | 1 per hunt group per station |
| release <sup>3</sup>                | Release            | Releases an agent from an ACD call.  | 1 per station                |
| ringer-off                          | Ringer Cutoff      | Ringer-Off: silences the alerting ringer on the station.   | 1 per station                |
| rs-alert                            | System Reset Alert | The associated status lamp lights if a problem escalates beyond a warm start.  | 1 per station                |
| rsvn-halt                           | rsvn-halt          | Remote Access Barrier Code Security Violation Notification Call: activates or deactivates call referral.   | 1 per system                 |
| scroll                              | Scroll             | ( <i>display button</i> ) Selects one of two lines (alternates with each press) of the 16-character LCD display. Only one line displays at a time. | 1 per station                |
| send-calls                          | Send All Calls     | Send All Calls: sends all calls to coverage as soon as they terminate at the station.  |                              |

*Continued on next page*

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name                           | Button label             | Description  | Maximum                |
|---------------------------------------|--------------------------|--|------------------------|
| send-term                             | Send All Calls-TEG       | Send All Calls For Terminating Extension Group: allows the user to forward all calls directed to a terminating extension group.        | 1 per TEG              |
| serv-obsrv                            | Service Observing        | Service Observing: activates Service Observing. Used to toggle between a listen-only and a listen-talk mode.                           | 1 per station          |
| signal <sup>16</sup><br>(Ext: ___)    | Signal (name or ext #)   | Signal: allows the user to manually signal (via ringing) a station associated with the button.   | 1 per signal extension |
| ssvn-halt                             | ssvn-halt                | Toggle whether or not station security code violation referrals are made to the referral destination.                                  | 1 per station          |
| stored-num                            | Stored Number            | ( <i>display button</i> ) Places the station's display into the stored number mode.  | 1 per station          |
| stroke-cnt                            | ACD SD Stroke Count      | Automatic Call Distribution Single Digit Stroke Count: sends a message to CMS to increment a stroke count number.                      | 1 per station          |
| term-x-gr <sup>17</sup><br>(Grp: ___) | Term Grp (name or ext #) | Terminating Extension Group: provides one or more extensions. Calls may be received but not originated with this button.               | 1 per TEG              |
| timer                                 | Timer                    | ( <i>display button</i> ) Starts a clock on the station to display elapsed time.   | 1 per station          |
| trk-ac-alm                            | FTC Alarm                | Facility Test Call Alarm: associated status lamp lights when a successful Facility Test Call (FTC) occurs.                             |                        |
| trk-id                                | Trunk ID                 | Trunk Identification ( <i>display button</i> ): identifies the tac (trunk access code) and trunk member number associated with a call. | 1 per station          |
| trunk-name                            | Trunk Name               | ( <i>display button</i> ) Displays the name of the trunk as administered on the CAS Main or on a switch without CAS.                   | 1 per station          |
| trunk-ns <sup>18</sup><br>(Grp: ___)  | Trunk Grp                | Trunk-Group Night Service: places a trunk-group into night service.  | 1 per trunk group      |

*Continued on next page*

Table 6-6. Voice-terminal feature button descriptions — *Continued*

| Button name  | Button label            | Description   | Maximum                 |
|--|-------------------------|---|-------------------------|
| verify   | Verify                  | Busy Verification: allows users to make test calls and verify a station or a trunk.   | 1 per station           |
| voa-repeat <sup>19</sup>                           | VOA repeat              | VDN of Origin Announcement.   | 1 per station           |
| vu-display <sup>20</sup><br>(format: __<br>ID: __) | VuStats #               | Enables VuStats and specifies a display format. It is recommended that, on the button label, you add some form of ID for the Display format (#).  | Depends on station type |
| whisp-anbk   | Answerback              | Whisper Page: allows station users to make and receive barge-in announcements to and from other station users without anyone else on the calls being aware of the announcements. These station users must have an administered COR that provides for intraswitch calling. |                         |
| whisp-act  | Whisper Page Activation | See the description of Whisper page above.  |                         |
| whisp-off  | Whisper Page Off        | See the description of Whisper Page above.  |                         |
| work-code <sup>3</sup>                             | Work Code               | Call Work Code: allows an ACD agent after pressing “work-code” to send up to 16 digits (using the dial pad) to CMS.   | 1 per station           |

1. Must be assigned to a dual-lamped line-appearance button.
2. List: List number 1 to 3 where the destination number is stored. DC: dial code number.
3. Grp: The split group number for ACD.
4. atd-qcalls: Zero-seeking attendant calls reported.
5. Ext: Extension of principal. (May be a VDN extension).
6. Grp: Intercom — Auto-lcom group number. This extension and destination extension must be in the same group.
7. TAC/Ext: Trunk or extension of voice terminal to be monitored.
8. Grp: Intercom — Dial (Dial lcom) group number.
9. Flash: Not administrable on attendant consoles.
10. Grp: Hunt group number.

11. Type: A "c" for coverage answer group, "h" for a uniform call distribution or direct department calling group.
  12. Link: Link number — 1 to 8 for multi-carrier cabinets or 1 to 4 for single-carrier cabinets.
  13. Ext: The destination extension. (May be a VDN extension)
  14. Grp: CO line group number.
  15. Grp: Group number of hunt group.
  16. Ext: The extension may not be a VDN extension.
  17. Grp: TEG number.
  18. Grp: Trunk group number.
  19. VDN of Origin Announcement must be enabled.
  20. Requires voice terminal with display. You can administer as many VuStats buttons as there are feature buttons available on the voice terminal. With a different VuStats display format assigned to each button, agents can use different buttons to access different statistics.  
format: the number (from 1 to 25) of the format you want the button to display.  
ID: a split number, trunk group number, agent extension, or VDN extension. The ID defines the agent, split, trunk group, or VDN that the display describes. ID is optional.
-

## Station form field descriptions

This section provides descriptions of standard fields on Station forms. Some of the fields are used for specific voice terminal types; others are used for all terminals. Unique fields and fields that require special consideration are listed with the appropriate voice terminal descriptions later in this book.

### Form Instructions

Page 1 of X

STATION

|                 |                        |        |

Screen 6-6. Station form (Page 3 of X)

## Field descriptions

---

The standard fields are organized alphabetically for easy access.

- **1-Step Clearing** — If you administer 1-step clearing to **n**, a call does not terminate again at the WCBRI terminal when the user drops from the call. If set to **y**, the call terminates again at the WCBRI terminal.
- **Abbreviated Dialing List1, List2, List3** — Enter **p** (personal), **s** (system), **g** (group), or **e** (enhanced). Up to 3 AD lists can be accessed by the voice terminal. If you enter **p** or **g**, you also must enter a personal list number or a group number, respectively.
- **Active Station Ringing** — Defines how a call rings at an off-hook station. Default is single.
  - Enter **continuous** to cause all calls terminated to this station to ring continuously.
  - Enter **single** to cause a call terminated to an off-hook (active or idle) station to receive one ring cycle and then ring silently.
  - Enter **if-busy-single** to cause a call terminated to an off-hook and idle station to ring continuously and a call terminated to an off-hook and active station to receive one ring cycle and then ring silently.
  - Enter **silent** to cause a call terminated to an off-hook (active or idle) station to just ring silently.
- **Adjunct Supervision** — Enter **y** if an analog disconnect signal is sent automatically to the port after a call terminates. Analog devices (such as answering machines and speakerphones) use this signal to turn the

devices off after a call terminates. In a hunt group environment, however, the disconnect signal blocks the reception of zip tone and incoming call notification by an auto-answer station when a call is queued for the station. For these environments, set this field to **n** so hunt group agents are alerted to incoming calls. *Adjunct Supervision* displays only when *Type* is **500, 2500, k2500, 8110, ops, ds1fd, ds1sa, VRU, VRUFD, or VRUSA**.

- **Assigned Member — Ext** — The extension is assigned automatically when the system is administered. This is the extension of the user who has an associated Data Extension button and shares the module.
- **Assigned Member — Name** — Display-only field that contains the name defined for the Assigned Member - Ext.
- **Att. Call Waiting Indication** — Enter **y** to assign Attendant Call Waiting to the voice terminal. This allows attendant-originated and attendant-extended calls to a busy single-line terminal to wait and sends distinctive call-waiting tone to the single-line user. Use of this feature is denied if *Data Restriction* is **y** or *Switchhook Flash* is **n**, or if *Data Privacy* is active via the voice terminal COS assignment.
- **Audible Message Waiting** — Enter **y** to have the voice-terminal user receive stutter dial tone when initiating a call. The tone indicates that the user has a waiting message. This field only appears if *Audible Message Waiting* is active on the System-Parameters Customer-Options form. This field does not control the Message Waiting Lamp.
- **AUDIX Name** — Displays the name of the AUDIX machine as it appears in the User-Defined Adjunct Names form. This field displays only for the R5r or later configuration.
- **Auto Answer** — Enter **all** to allow all calls (ACD and non-ACD) terminated to an idle station to be cut through immediately. Enter **acd** to allow only ACD split/skill calls and direct agent calls to auto answer. If this field is **acd**, Non-ACD calls terminated to a station ring audibly. Enter **none** (default) to cause all calls terminated to this station to receive an audible ringing treatment. In EAS environments, the auto answer setting on the Agent LoginID form may override a station's setting when an agent logs in there.

 **NOTE:**

For analog stations, if *Auto Answer* is **acd** and the station is off-hook and idle, only the ACD split/skill calls and direct agent calls auto answer; non-ACD calls receive busy treatment. If the station is active on an ACD call and a non-ACD call arrives, the Agent receives call-waiting tone.

- **Auto Select Any Idle Appearance** — Enter **y** to allow automatic selection of any idle appearance for transferred or conferenced calls. The system first attempts to find an idle appearance of the call being transferred or conferenced. If that attempt fails, the system selects the first idle appearance. Default is **n**.

- **BCC** — Displays when `ISDN-PRI` or `ISDN-BRI` Trunks is enabled on the System-Parameters Customer-Options form. Display-only field set to 0 for stations (that is, indicates voice or voice-grade data).

See “Generalized Route Selection” in this book for a detailed description of Bearer Capability Classes (BCC) and their ability to provide specialized routing for various types of voice and data calls. The BCC value is used to determine compatibility when non-ISDN facilities are connected to ISDN facilities (ISDN Interworking).

- **Bridged Call Alerting** — Enter **y** to enable audible ringing for TEG, PCOL, bridged appearances, or Data Extension calls. If Bridged Call Alerting is **n** and `Per Button Ring Control` is **n**, audible ringing is suppressed for incoming calls on bridged appearances of another terminal's primary extension.
- **Building** — Enter up to 7 characters to identify the voice-terminal building location. Valid entries are listed in the site table.
- **Button Assignments** — Enter the abbreviated software name to assign a feature button. The feature buttons you can assign to voice terminals are listed with each terminal description.

**NOTE:**

If Terminal Translation Initialization (TTI) is activated, insert no button other than **call-appr** in the first button position. TTI needs the button on the first call appearance to get dial tone.

- **Cable** — Enter up to 5 characters to identify the cable connecting the voice-terminal jack to the system. This field may be left blank. You also can enter this information in the Blank column on the Port Assignment Record.
- **Call Waiting Indication** — Enter **y** to activate Call Waiting Termination for the voice terminal. This allows voice-terminal, attendant-originated, and outside calls to busy single-line terminals to wait and sends a distinctive call-waiting tone to the single-line user. This feature is denied if `Data Restriction` is **y** or `Switchhook Flash` is **n**, or if Data Privacy is active via the voice terminal COS assignment.
- **CDR Privacy** — Enter **y** to enable Call Privacy for each station. This option allows digits in the called number field of an outgoing call record to be blanked, on a per-station basis. The number of blocked digits is administered system-wide in `Privacy - Digits to Hide` on the CDR System Parameters form. Default is **n**.
- **Circuit Switched Data Attributes** — The following fields only appear on the ISDN-BRI Data Module form:
  - **Default Duplex** — Enter **full** (default) or **half** to identify the duplex mode.
  - **Default Mode** — Enter **sync** or **async** (default) to identify the data mode.

— **Default Speed** — Enter **1200** (default), **2400**, **4800**, or **19200** to identify the data rate.

- **COR** — Enter a Class of Restriction (COR) number (**0** through **95**) to select the desired restriction; default is **1**.
- **Cord Length** — Enter a number from **0** to **99** to specify the length (in feet) of the cord attached to the receiver. Default is **0**.
- **COS** — Enter the desired Class of Service (COS) number (**0** through **15**) to select allowed features. Default is **1**.
- **Country Protocol** — Enter the protocol that corresponds to your supported initialization and codesets. The Country Protocol must match any previously-administered endpoint on the same port. The following table lists the valid protocol entries. Default is **1** (US Bellcore).

| Country/Area                           | Protocol |
|--|----------|
| Australia                              | 2        |
| ETSI (Europe)                          | etsi     |
| Japan                                  | 3        |
| Singapore                              | 6        |
| United States (Bellcore National ISDN) | 1        |

- **Coverage Msg Retrieval** — Applies if the voice terminal is marked for LWC Reception. Enter **y** (default) to allow users in the voice terminal Coverage Path to retrieve Leave Word Calling (LWC) messages for this voice terminal.
- **Coverage Module** — Enter **y** to indicate that a coverage module is connected to the station. Entering **y** displays an additional page that contains the button assignment configurations for the module.
- **Coverage Path 1** or **Coverage Path 2** — Enter a coverage-path number or time-of-day table number from a previously-administered Call Coverage Path form or Time of Day Coverage Table form. Enter a coverage path number from **1** to **9999** for R5r and later configurations or from **1** to **999** for R5vs/si and later configurations. Enter a time-of-day coverage table number from **t1** to **t999**. Leave blank if no coverage is desired.

**NOTE:**

If Modified Misoperation is active (Misoperation Alerting is **y** on the Feature-Related System Parameters form), you must assign a Coverage Path to all stations on the switch.

- **CRV Length** — Displays only for ASAI stations. Enter **1** (default) or **2** to indicate the length of CRV for each interface.

- **Data Extension** — Enter the extension assigned to the data module. A data extension can be a 1- to 5-digit number and must agree with the Dial Plan.
- **Data Module** — Enter **y** to indicate that a data module will be administered with the voice terminal. Entering **y** displays the Data Module form.
- **Data Module Capabilities** — The following field displays only on the ISDN-BRI Data Module form:
  - **Origination Default Data Applications** — Identifies the mode for originating data calls if the mode is not specified with the calling parameters. This mode is also used for terminating trunk calls that do not have specified bearer capability or administered connections. Possible mode values are M0 (mode 0), M1 (mode 1), M2 (mode 2), and M3/2 (mode 3/2 adaptable), or blank. Valid entries are **M0**, **M1**, **M2\_A** (default), **M2\_S**, or **M3/2**.
- **Data Restriction** — Enter **y** to prevent tones, such as call-waiting tones, from interrupting user calls. Data restriction provides permanent protection and cannot be changed by the voice-terminal user. Default is **n**. Do not assign a Data Restriction if `Auto Answer` is **all** or **acd**.
- **Default Dialing Abbreviated Dialing Dial Code** — Displays only when the `Special Dialing Option` is set to default. Enter a list number (**0** through **999**) associated with the AD list. When the user goes off-hook and enters a carriage return following the DIAL prompt, the system dials the AD number. The data call originator also can perform data-terminal dialing by specifying a dial string that may or may not contain alphanumeric names.
- **Display Cartridge** — Enter **y** to indicate there is a display cartridge associated with the station (7404D voice terminals only). Entering **y** displays an additional page that contains the button assignment configurations for display buttons. Default is **n**.
- **Display Client Redirection** — Only administrable if `Hospitality` is enabled on the System-Parameters Customer-Options form. This field affects the station's display on calls that originated from a station with Client Room Class of Service. When set to **n**, this station's display does not show the redirection information for all calls originating from a Client Room (even redirected calls) that terminate to this station. Only the client name and extension (or room, depending on what is administered on the System-Parameters Hospitality form) display. When set to **y**, the redirection information for a call originating from a Client Room and terminating to this station displays.

**NOTE:**

For stations with an audix station type, AUDIX Voice Power ports, or ports for any other type of messaging that needs display information, Display Client Redirection must be set to **y**.

- **Display Language** — Displays only when `Display Module` is **y**. Enter **english** (default), **french**, **italian**, **spanish**, or **user-defined** to specify the display language.
- **Distinctive Audible Alert** — Enter **y** (default) so the voice terminal can receive the 3 different types of ringing patterns which identify the type of incoming calls. Features providing distinctive ringing may not work properly toward off-premises voice terminals
- **Endpt ID** — Displays only if `Endpt Init` is **y**. Enter a 2-digit number (**00–62**). Each Endpt ID field must have a unique value for each endpoint on the same port.

This field provides for multipoint configuration conformance to the Bellcore Terminal Initialization procedures. In these procedures, a multipoint configuration requires the last 2 digits of the Service Profile Identifier (SPID) be between 00 and 63 and be binary unique for each endpoint. This field, combined with the SPID, gives the effective SPID administered into the terminal. Bellcore ISDN-1 requires the SPID programmed into the endpoint contain at least 9 digits. (For example, if the SPID is **1234**, and `Endpt ID` is **01**, then the SPID administered on the terminal is 000123401. The three leading zeros are necessary to create a 9-digit SPID.)

- **Endpt Init** — Displays only if `MIM Support` is **y** and indicates the terminal's endpoint initialization capability. Enter **y** (default) if the terminal supports Bellcore ISDN-1 terminal initialization procedures. Enter **n** for all other country protocols.

Endpoint initialization is a procedure, required for multipoint operation, by which User Service Order Profile (USOP) is associated with an endpoint on the ISDN-BRI. This association is made via the SPID, administered into the system, and entered into the ISDN-BRI terminal. For an ISDN-BRI terminal to be operational in a multipoint configuration, both the administered SPID and the SPID programmed into the ISDN-BRI terminal must be the same. Therefore, the SPID of new or reused terminals must be programmed to match the administered SPID value.

- **Event Minimization** — Allows you to minimize events sent on a link. It displays only if you set `Type` to **asai**. Enter **y** when an application or library does not want to receive identical event reports over different associations. When minimization is enabled, the switch sends a single event report on only one association and discards any remaining reports. It is up to the library or application to report this event to other interested parties or applications. Default is **n**.
- **Extension** — Displays the extension you specified when you accessed this form. When administering the form, enter a valid extension (1 to 5 digits) to access the form.
- **Feature Module** — Enter **y** to indicate the station is connected to a feature module. Default is **n**. Entering **y** displays an additional page that contains the button assignment configurations for the module.

- **Fixed TEI** — For ASAI, enter **y**. This field displays only for ISDN-BRI data modules and ASAI links. It indicates that the endpoint has a fixed Terminal Endpoint Identifier (TEI). The TEI identifies a unique access point within a service. You must administer TEIs for fixed TEI terminals. However, for terminals with the automatic TEI capability, the system dynamically assigns the TEI. Entering **y** displays the TEI field.
- **Floor** — Enter up to 7 characters to identify the voice-terminal floor location.
- **H.320 Conversion** — Allows H.320 compliant calls made to this voice terminal to be converted to voice-only. Because the system can only handle a limited number of conversion calls, you may need to limit the number of terminals with H.320 conversion.
- **Headset** — Enter **y** if the terminal has a headset.
- **HOT LINE DESTINATION — Abbreviated Dialing Dial Code** — Displays only when `Special Dialing Option` is **hot-line**. Enter a list number (associated with the AD List) from **0** to **999**. When the user goes off-hook on a Data Hot Line call, the system dials the AD number.
- **HOT LINE DESTINATION — Abbreviated Dialing List Number** — Enter **1**, **2**, **3**, or leave blank (default) to identify the abbreviated dialing list to access when originating a call.
- **HOT LINE DESTINATION — Dial Code** — Enter a number from **0** to **999** or leave blank (default). This field is the index for the Abbreviated Dialing List that contains the digits to be dialed when originating a call.
- **Hunt-to Station** — Enter the extension the system should hunt to for this station when the station is busy. This entry functions as one entry in a station hunting chain. You must specify an extension defined as a local voice station in your dial plan. A station cannot be its own hunt-to station. This field displays only when `Type` is **500**, **2500**, **k2500**, **7101A**, **7103A**, **7104A**, or **8110**.
- **Idle Appearance Preference** — Enter **y** or **n** (default) to indicate which call appearance is selected when the user lifts the handset and there is an incoming call. If you enter **y**, the user connects to an idle call appearance instead of the ringing call. If you enter **n**, the Alerting Appearance Preference is set and the user connects to the ringing call appearance.
- **Ignore Rotary Digits** — Enter **y** to indicate that rotary digits from the set should be ignored. Enter **n** (default) to make sure they are not ignored. If this field is **y**, the short switch hook flash (50 -150) from a 2500-type set is ignored.
- **ITC** — (Information Transfer Capability) Enter **restricted** (default) or **unrestricted** to indicate the type of transmission facilities to be used for ISDN calls originated from this endpoint. The field does not display for voice-only or BRI stations.

- If you set to **restricted**, either restricted or unrestricted transmission facilities are used to complete the call. A restricted facility is a transmission facility that enforces 1's density digital transmission (that is, a sequence of 8 digital zeros are converted to a sequence of 7 zeros and a digital 1).
- If you set to **unrestricted**, only unrestricted transmission facilities are used to complete the call. An unrestricted facility is a transmission facility that does not enforce 1's density digital transmission (that is, digital information is sent exactly as is).
- **Jack** — Enter up to 5 characters to identify the jack location for the voice terminal connection. This field may be left blank.
- **Lock Messages** — Enter **y** to restrict other users from reading or canceling the voice-terminal messages or retrieving messages via Voice Message Retrieval. Default is **n**.
- **LWC Activation**— Enter **y** (default) to allow internal voice-terminal users to leave short LWC messages for this terminal. If the system has hospitality, enter **y** for guest-room voice terminals if the terminal designated to receive failed wakeup messages should receive LWC messages that indicate the wakeup calls failed. Enter **y** if LWC Reception is **audix**.
- **LWC Reception** — Enter **msa-spe** (default) if LWC messages are stored in the system or on the Messaging Server Adjunct - Switch Processor. Enter **audix** if the messages are stored on the Audio Information Exchange System. Default is **none**.
- **Message Lamp Ext** — Enter the extension of the station to be tracked. Default is the station's extension. This field displays only when **Type** is **7101A**, **7103A**, **8110**, or **VRU**.
- **Message Waiting Indicator** — Enter **led** if the message waiting indicator is a light-emitting diode (LED). Enter **neon** if the indicator is a neon indicator. This field displays only for ISDN-BRI data modules and for 500, 2500, K2500, 7104A, 8110, and VRU voice terminals.
- **Messaging Server Name** — Displays the name of the server as it appears in the User-Defined Adjunct Names form. This field displays only for the R5r and later configuration.
- **MIM Mtce/Mgt** — Displays only if **MIM Support** is **y**. It indicates if the terminal supports MIM Maintenance and Management capabilities other than endpoint initialization. Default is **n**.
- **MIM Support** — (Management Information Message Support) This field displays only for ISDN-BRI data modules and ASAI. This field supports MIM endpoint initialization (SPID support) and other Maintenance or Management capabilities. Enter **n** for ASAI. Enter **y** to display **Endpt Init** and **MIM Mtce/Mgt**.

- **MM Complex Data Ext** — The extension assigned to the data module of the multimedia complex. User can dial this extension to place either a voice or a data call, and voice conversion, coverage, and forwarding apply as if the call were made to the 1-number. Valid values conform with your dial plan.
- **Multimedia Early Answer** — Allows you to establish multimedia early answer on a station-by-station basis. If this station will receive coverage calls for multimedia complexes, but is not multimedia-capable, enter **y** to ensure that calls are converted and talk path is established before ringing at this station.
- **Name** — Enter up to a 27-character name for the person associated with this voice terminal or data module. This field can be shared with a Room number. The name assigned to a voice terminal remains with that voice terminal until it is changed. The Integrated Directory lists the names as they should be entered on the forms.
- **Off Premise Station** — (analog terminals only) Enter **y** if this voice terminal is not located in the same building with the system. Enter **n** (default) if the voice terminal is located in the same building with the system. If you enter **y**, you must complete **R Balance Network**.
- **PCOL/TEG Call Alerting** — Displays only for 510 voice terminals. Enter **y** to alert the station for Personal CO Line/Terminating Extension Group calls. Default is **n**.
- **Per Button Ring Control** — Enter **y** to allow users to select ring behavior individually for each call-appr, brdg-appr, or abrdg-appr on the station and to enable Automatic Abbreviated and Delayed ring transition for each call-appr on the station. Also, enter **y** if you do not want the system to automatically move the line selection to a silently alerting call unless that call was audibly ringing earlier. Enter **n** (default) if you want calls on call-appr buttons to always ring the station and calls on brdg-appr or abrdg-appr buttons to always ring or not ring based on the **Bridged Call Alerting** field value. Also, enter **n** if you want the system to move line selection to a silently alerting call if there is no call audibly ringing the station.
- **Personalized Ringing Pattern** — Enter a Personalized Ringing Pattern (1 through 8) according to the following table. (L = 530 Hz, M = 750 Hz, and H = 1060 Hz) Default is 1.

| Ring pattern | Tone sequence          |
|--------------|------------------------|
| 1            | MMM (standard ringing) |
| 2            | HHH                    |
| 3            | LLL                    |
| 4            | LHH                    |
| 5            | HHL                    |

| Ring pattern | Tone sequence |
|--------------|---------------|
| 6            | HLL           |
| 7            | HLH           |
| 8            | LHL           |

- **Per Station CPN - Send Calling Number** — Valid entries are:
  - **y** — all outgoing calls from the station will deliver the Calling Party Number (CPN) information as “Presentation Allowed.”
  - **n** — no CPN information is sent for the call.
  - **r** — outgoing non-DCS network calls from the station will deliver the Calling Party Number information as “Presentation Restricted.”
  - **blank (unadministered)** — the sending of CPN information for calls is controlled by any administration on the outgoing trunk group the calls are carried on. This is the default.
- **Port** — Enter 7 characters to specify a port as follows:

| Characters | Meaning        | Value  |
|------------|----------------|--|
| 1-2        | Cabinet Number | 01 through 44 (R5r)<br>01 through 03 (R5si)<br>01 (R5vs) |
| 3          | Carrier        | A through E  |
| 4-5        | Slot Number    | 01 through 20  |
| 6-7        | Circuit Number | 01 through 32  |

**NOTE:**

You can enter X in `Port` to indicate that there is no hardware associated with the port assignment (Administration Without Hardware). These stations are referred to as phantom or AWOH stations.

For DCP sets, the port can only be assigned once. ISDN-BRI provides a multipoint configuration capability that allows a previously assigned port to be specified more than once as follows: 2 stand-alone voice endpoints, 2 stand-alone data endpoints, or 1 integrated voice and data endpoint.

However, for the following cases, the port is assumed to be fully assigned:

- Maximum number of users (currently 2) are assigned on the port.
- One of the users on the port is a fixed TEI station.
- One of the users on the port has B-channel voice and B-channel data capability.

- One of the users on the port has no SPID assigned, which includes terminals that have no SPID initialization capability.
- **R Balance Network** — Enter **y** to select the R Balance Capacitor network. Enter **n** (default) to select the standard resistor capacitor network. You must complete this field if *Off-Premise Station* is **y**. Enter **n** when the station port circuit is connected to terminal equipment (such as SLC carriers or impedance compensators) optioned for 600-ohm input impedance and the distance to the terminal equipment from the system is less than 3,000 feet. Enter **y** in all other cases.
- **Redirect Notification** — Enter **y** (default) to give a half ring at this voice terminal when calls to this terminal are redirected (via Call Forwarding or Call Coverage). Enter **y** if *LWC Reception* is **audix**.
- **Restrict Last Appearance** — Enter **y** (default) to restrict the last idle call appearance for incoming priority calls and outgoing call originations only.
- **Room** — Enter up to 10 characters to identify the voice terminal location. Enter up to 5 characters to identify the guest room number, if this station is one of several to be assigned a guest room and the *Display Room Information* in Call Display is **y** on the Hospitality-Related System Parameters form. This field may be blank.
- **Security Code** — Enter the 3- to 8-digit security code required by users for specific system features and functions, including Personal Station Access, Redirection of Calls Coverage Off-Net, Leave Word Calling, Message Retrieval, and Demand Printing. The required security code length is determined by *Minimum Security Code Length* on the Feature-Related System Parameters form.
- **Select Last Used Appearance** — Enter **y** to indicate a station's line selection is not to be moved from the currently selected line button to a different, non-alerting line button. If you enter **y**, the line selection on an on-hook station only moves from the last used line button to a line button with an audibly alerting call. If there are no alerting calls, the line selection remains on the button last used for a call. Enter **n** so the line selection on an on-hook station with no alerting calls can be moved to a different line button, which may be serving a different extension.
- **Set Color** — Enter up to 6 characters to describe the set color.
- **Speakerphone** — Enter **y** to indicate a speakerphone is attached to the voice terminal. Default is **n**.
- **Special Dialing Option** — Enter **hot-line**, **default**, or leave blank for regular (normal) keyboard dialing. This field identifies the type of dialing for calls when this data module originates calls.
- **SPID** — (Service Profile Identifier) This field displays only if *Endpt Init* is **y**. Enter a variable length parameter (up to 10 digits). SPID is a numeric string, which means that the value of 00 is different from 000. The SPID must be different for all terminals on the BRI and from the Service SPID. The SPID should always be assigned. If the SPID is not assigned for the

first BRI on a port, any other BRI assignment to that port are blocked. Valid entries are numeric strings in the range of **0** through **9999999999**. Default is the station extension.

 **NOTE:**

If using Administration Without Hardware for an ISDN-BRI extension (`Port` set to `X`) and Terminal Translation Initialization (TTI) is intended to be used to assign the port, then the SPID number must equal the station number.

- **Switchhook Flash** — Enter **y** (default) to allow users to use the switchhook flash function to activate Conference/Transfer/Hold and Call Waiting. Enter **n** to disable the flash function so that when the switchhook is pressed while active on a call, the call drops. If this field is **n**, you must set `Call Waiting Indication` to **n**.
- **TEI** — Displays only when `Fixed TEI` is **y**. Enter a 1- or 2-digit number from **0** through **63**. Default is blank.
- **Tests** — Enter **y** (default) to enable port maintenance tests. If the terminal equipment (dictaphone) connected to the port does not support these tests, you must enter **n**.
- **TN** — Enter the Tenant Partition number. Default is **1**.
- **Type** — Enter the voice-terminal type. See [Table 6-4](#) for a list of voice terminals.
- **XID** — Displays only for an ISDN-BRI data module or an ASAI link. Used to identify layer 2 XID testing capability. Valid entries are **y** (default) or **n**.

## 10-MET, 20-MET, and 30-MET voice terminals

The 10-, 20-, and 30-multielectronic telephone (MET) voice terminals contain 10, 20, and 30 feature buttons, respectively.

### Form instructions

To administer a 10-MET, 20-MET, or 30-MET voice terminal, complete the standard as well as the following unique Station form fields.

### Page 1 of the form

Page 1 of X

STATION

|                 |                        |         |

## 500, 2500, K2500, 7101A, 7102A, 7103A, 7104A, 8110, DS1FD, DS1SA, and VRU voice terminals

DEFINITY allows you to administer the following single-line voice terminals: 500, 2500, K2500, 7101A, 7102A, 7103A, 7104A, 8110, DS1FD, DS1SA, or VRU voice terminals.

### Form instructions

To administer a single-line voice terminal, complete the standard as well as the following unique Station form fields.

#### NOTE:

You administer a K2500 Key Phone System Interface the same as you would a 2500 voice terminal, but the K2500 has the ability to accept either rotary or DTMF digits. You cannot administer the K2500 to ports on a TN2135 Analog Line circuit pack

| R Balance Network? n   | Message Lamp Ext: 1000__         |          |

### Screen 6-10. Single-line Station form (Page 1 of 3)

- **Type** — Enter **500, 2500, k2500** (see note), **7101A, 7103A, 7104A, 8110, ops, ds1fd, ds1sa, VRU, VRUFD, or VRUSA**.
  - For a 7102A voice terminal, enter **7101A**.
  - For a 2500 DMGC voice terminal, enter **7101A**. This enables the Recall button and switchhook flash functions.

- When the forward disconnect message is needed for DS-1 ports (Lineside DS1), enter **ds1fd**, **ds1sa**, **VRUFD**, **VRUSA**, and a DS-1 circuit pack, either TN767E (or later) or TN464F (or later) circuit pack.
- The **ds1sa** or **vrusa** support special access signaling; the **ds1fd** or **vrufd** support exchange signaling. The forward disconnect signal for both of these station types is a transition of the a signaling bit for 600ms. The call endpoint (typically a VRU) must have the ability to respond to the disconnect message. If a DS1 port is translated with a 500 or 2500 voice terminal, the DS1 protocol does not provide a means of sending forward disconnect.
- The **ops** is a DS1 type without a forward disconnect signal.
- Enter **ops**, **ds1fd**, **ds1sa**, **VRUFD**, or **VRUSA** to allow a voice response unit such as Conversant to interface with a DS1 board on the switch. At the far end, the voice response unit typically uses a DS0 on a channel bank. At the PBX, the DS0 enters the switch on the DS1 trunk to which the channel bank is connected.
- The **ds1sa** is the same as the **ds1fd**, but also includes messages to support the special access signaling required by the VRUs. The **ds1sa** supports all the fields that the **ds1sa** does and uses the same TN767C or greater circuit pack.
- VRU, VRUFD, and VRUSA are valid types only if **DTMF Feedback Signals for VRU** is enabled on the Customer-Options System Parameters form. The VRU type is used for an analog port while VRUFD or VRUSA are used for DS1 ports.

## **6402, 6402D, 6408, 6408+, 6408D, 6408D+, 6416D+, 6424D+ voice terminals**

---

The 6400-series voice terminals are DCP 2-wire voice terminals that work with DEFINITY Release 6 and future releases. 6400-series voice terminals operate similar to the 8400- and 9400-series voice terminals, although there are some enhancements, feature, and physical differences. The 6400-series voice terminals have:

- XM24 expansion module
- Different number of call appearances and feature buttons
- New defaults and features for softkeys
- Last number dialed (LND) button instead of a drop button (the drop function can be administered on any button)

The number of call appearances on a terminal is identified by the last two digits in the terminal name. The series includes two single-line sets (6402 and 6402D), 8-button sets, a 16-button set, a 24-button set, and a 24-button expansion module (on the 6416D+ and 6424D+ voice terminals).

### **To administer a 6400-series terminal**

To administer a 6400-series voice terminal, complete the standard as well as the following unique Station form fields.

For information about adjusting the system-level parameters and audio levels for the 6400-series voice terminals, see [“Terminal Parameters form” on page 6-9](#).
